In laying out a line it is of great importance that heavy gradients and sharp curves should be avoided, as the former add to the cost of working and the latter interfere with speed. Some of the sharpest railway curves in the United Kingdom are on the narrow gauge Festiniog line, where there are curves as sharp as the sweep of Oxford Circus—of but 116 feet radius—for short lengths. This line runs to a point 700 feet above Portmadoc in less than 12 miles, giving an average gradient of one in 92, and a maximum gradient of one in 80. On the Sleaford and Bourne section of the Great Northern Railway the line, on the other hand, is practically level, the gradients averaging about one in 400. The advantage of an easy gradient will be seen from the following calculation: If an engine and tender, weighing together 56 tons, is capable of drawing a maximum load of, say, 40 loaded wagons, weighing 560 tons, at 25 miles per hour on the level, it will

only take the following loads over the gradients named below, and the speed would also be considerably reduced.

Level	40	wagons	weighing	560 tons.
Incline 1 in 100	20	"	"	280 "
" 1 in 50	10	"	"	140 "
" 1 in 30	6	"	"	84 "

Before the Board of Trade will sanction the opening of a line it has to be satisfied as to the strength of the bridges, that a minimum distance of 6 feet has been left between the lines, and as to other conditions.

The form of 'permanent way' has altered considerably since the laying of the first railways. The first wrought-iron rails used on the Stockton and Darlington weighed 28 lb. to the yard. The cheapening of steel which followed the invention of the Bessemer process has led to the use of that material for rails throughout the world, and the size of the rails has been successively increased until between 80 and 85 lb. per yard is the usual weight. In British railway practice the rails are supported on cast-iron chairs held by wooden wedges, and the chairs are spiked on to transverse wooden sleepers. On American and colonial lines chairs are dispensed with, and the rails are spiked direct on to the sleepers. The joints are made by 'fish-plates' bolted on each side of the rails, and the bolt-holes are made oblong or elliptical to permit of the expansion and contraction of road under changing temperatures. Blocks of stone were sometimes used in the early history of railways to support the metals, but the rigidity obtained was found to be very destructive of rolling-stock, and wooden sleepers lying on gravel ballast are now almost universally employed. Iron sleepers have been found serviceable in some countries where wood is liable to the attacks of insects.

Light Railways.—In order to benefit the agricultural and other interests in districts too poor to make or support a railway on the usual terms, the Light Railway Act was passed in 1896 to empower the construction of lines of cheaper construction and simpler working than the ordinary. To avoid the heavy parliamentary expenses, the bill gives power to a Light Railway Commission to make inquiry, and if it is satisfied, to issue orders (subject to the approval of the Board of Trade) for the construction of such railway. County, Burgh, and District Councils are also empowered to initiate such railways, or otherwise to advance part of the necessary capital, and the Treasury may also advance a like sum at 3½ per cent. not exceeding one-fourth of the whole capital. Several acts have been passed for the construction of light railways in Ireland as a means of relieving distress. Under the act of 1890 government voted £136,200 for this purpose.

Signals.—At a very early stage of railway working a system of signals was found to be necessary. In 1830, when the Liverpool and Manchester line was opened, a flag by day and lamp by night were adopted; but this soon proved inadequate for the traffic, and in 1837 the managers of the Grand Junction Railway erected poles about 12 feet in height, with discs and lamps turned through a quarter circle by the pointsman working a lever at the base. About 1842 a semaphore signal, somewhat similar to those now in use, was introduced. Up to 1846 there were no 'distant' signals, but in that year this extra precaution was adopted. The successful concentration and interlocking of the levers working both points and signals was effected in 1856 at the Bricklayers' Arms Junction, and in 1859 the first interlocking frame was fixed at Willesden Junction. Since that date the interlocking and concentration of signal and point levers has made rapid progress, and of the total signals and points in the United Kingdom over 91 per cent. are thus protected. The signals now in use may be classified as 'home,' 'distant,' 'starting,' 'advanced starting,' and 'disc,' the last named used on goods sidings. By the interlocking of points and signals, if the signalman has for instance moved a lever that opens a pair of points to enable a train to come out of a siding on to the main line, the 'home' and 'distant' signals must be at 'danger' to stop any train from approaching on the main line, and it is impossible for him to lower them.

In the working of a railway the telegraph plays a very important part. By its means trains are started and protected throughout their journey; the signalmen are placed in communication with each other, and are warned if the signals are not acting properly. On the London and North-Western system there are over 11,000 miles of wire used for purely railway purposes, apart from the 6800 miles of Post-office wires. Before the introduction of telegraphy on the railway signals were placed at certain points, and kept fixed at 'danger' for a certain time before another train was allowed to pass. In 1853, however, the absolute block-telegraph system was introduced. Under the absolute block there can be only one train in a given section at the same time, while under the 'permissive' system there may be more than one train in each section. Taking A and B as the stations at each end of the section, the working of the absolute block system is thus arranged: the signalman at station A gives to station B what is called the 'Be Ready' signal, which indicates the nature of the approaching train. The man at station B, if the previous train has passed his cabin, and he knows that the section between A and B is clear, repeats this signal to the next box. The train is then despatched from A, the signalman at that box giving the warning 'Train on Line,' which the man at B acknowledges, and at once gives the 'Be Ready' signal to C, and so on. As soon as the train has passed B, the man in that box telegraphs 'Line clear' to A, who acknowledges the message. Of the double lines in the United Kingdom over 94 per cent. are worked on the absolute block system. On most single lines the 'train-staff and ticket' system is adopted. In this case, supposing there are three trains at the terminus of a line or section to proceed to the other end, the first and second start with a ticket, but the third carries a staff which is the only key for the box in which the tickets are placed. No train is allowed to enter the opposite end of a section until the train staff arrives, so that it is impossible for two trains to meet. The proper distance between trains running in the same direction is maintained by fixed signals, and the block telegraph is the same as on double lines. If necessary, the line is divided into sections with crossing places, each section being worked as a separate line. By the 'train-tablet' system, a circular metal disc is electrically controlled from the other end of the section, forming practically a 'train-staff' and block-telegraph system combined. Mechanical details of signalling have on occasions to be superseded by manual work. In case of fogs a man, generally one of the platelayers, is stationed at the foot of each 'distant' signal, and as the semaphore is raised to 'danger' he places on the rails two detonating signals, which are exploded by the engine as it passes over them. If the engine-driver hears no explosion he knows the line is clear.

Gauge.—In deciding upon the gauge to be adopted the constructors of the first railways naturally adopted that of the tramroads then in existence—viz. 4 feet 8½ inches, that standard having been fixed upon as being in common use for the

ordinary vehicles of the country. On all the lines built by George Stephenson, and most of the other leading engineers in the United Kingdom, this 4 feet 8½ inches gauge was adopted; but in 1838 Brunel, in his desire to secure double the attained speed and capacity of the then constructed railways, determined upon a 7-feet gauge for the Great Western Railway. This brought about the now historic battle of the broad and narrow gauges. The Eastern Counties (the present Great Eastern), opened for traffic in 1843, had a 5-feet way, the Caledonian 5 feet 6 inches, and in Ireland there were 5 feet 2 inches and 6-feet gauges. So long as lines of different gauges serving separate districts did not come into contact the inconvenience of breaks of gauge were not felt, but when the broad and narrow gauges met at Gloucester in 1845, and at other points later on, the evil effects were soon felt. Goods and passengers had to be transferred from the one set of carriages to the other, and no through services were possible until at a later period the Great Western laid a third rail to accommodate the narrow-gauge trains. So serious became the difficulties which arose through the breaks of gauge that in 1845 a commission was appointed; it reported in favour of the narrow gauge, and in August 1846 an act was passed enacting that thereafter it should not be lawful to construct any railway for the conveyance of passengers on any gauge other than 4 feet 8½ inches for Great Britain and 5 feet 3 inches for Ireland. It was, however, provided that railways constructed before the passing of the act on any other gauge should be allowed to maintain their independence. The Great Western, therefore, continued to maintain its broad gauge, and as late as 1867 there were 1456 miles of line on this system, having junctions at twenty-six points with the narrow gauge. In 1869, however, the directors of the Great Western realised the disadvantages of their isolation; the narrow gauge has been gradually adopted on the system, and the date fixed for the final disappearance of the broad gauge was the 20th May 1892. Parliamentary sanction has, however, been given to various exceptionally narrow gauge lines. In most European countries the gauge adopted has been about the same as the British standard, with the exception of Spain and Russia, where the gauge is somewhat wider.

Accidents.—The number of persons killed on the railways of the United Kingdom in 1890 was 1076, and injured 4721. Of those killed 118, and of the injured 1361, were passengers; but of the fatal accidents only 18, and of the injuries 496 were due to causes beyond the control of the passengers—viz. accidents to trains—the others arising from various causes, especially want of caution on the part of individuals themselves. Taking the number of passenger journeys, exclusive of those of season-ticket holders, at 817,744,046, the proportion of passengers returned as killed by accidents beyond their own control was one in 45,430,224, and of injured one in 1,648,677. In the case of railway servants 12 were killed and 147 injured by train accidents, and 487 killed and 2975 injured by other accidents. The number of persons employed on the railways of the United Kingdom is estimated at 346,426, so that one in every 694 was killed and one in 111 injured by train and other accidents. These are very high proportions, but it is only fair to the managers to say that every precaution is taken to secure the safety of employés. Too often, however, salutary regulations are broken and mechanical appliances for their protection neglected by the men themselves. The proportion of deaths and injuries has moreover steadily declined of late years. It having been suggested that many accidents were due to men working overtime, railway companies have now to make periodical returns as to the hours of labour on their systems.

Speed.—Mr Worsdell, the locomotive engineer of the North-Eastern Railway, with a powerful engine and a moderately heavy train attained on one occasion a speed of 86 miles an hour. On the Philadelphia and Reading Railroad in the United States in August 1891 a distance of about 3 miles was run at a rate of 90 miles an hour. Mr Stroudley, engineer of the Brighton line, said that a light engine could easily attain 100 miles an hour. The actual running-time of trains is of course considerably below such limits. The fastest speed in ordinary service and the largest proportion of high speed trains are to be found on the railways of Great Britain—the careful finish of the road-beds, the fencing of the track, and the comparative absence of level crossings giving an undoubted advantage in this respect over all foreign systems. The best regular running-time as yet made on railways was in the 'race to the North,' between the East and West Coast routes, commenced in 1888. The London and North-Western in May of that year announced their intention of reducing their time between Euston and Edinburgh from 10 to 9 hours. The East Coast companies accepted the challenge, reducing their time from 9 to 8½ hours, and in August the time by both routes was reduced to 8 hours. The distances to be covered were by the East Coast 393 miles, and by the West Coast 400¼ miles, the gradients on the former being more favourable. The 'race to the north' was resumed between the rival railways in 1895, when on 22d August the west route did the journey from London to Aberdeen, 540 miles, in 8 hours 40 minutes, an average of 63·3 miles per hour, including stoppages. The expense and risk of these high-pressure speeds led to an agreement, and the rivalry was stopped. The fastest train now performs the journey from London (King's Cross) to Edinburgh in 7 hours 45 minutes, to Perth in 9 hours 25 minutes, and to Aberdeen in 11 hours 20 minutes, including stoppages. On the New York Central in 1891 a special run was made from New York to Buffalo, a distance of 437 miles, in 440 minutes, including three stops aggregating 15 minutes. The following may be taken as the best express services now regularly running in different parts of the world in miles per hour, including and excluding stops respectively:

England—London to Leeds, G.N.R.	48·4	51
United States—New York to Philadelphia	47·9	49·8
France—Paris to Calais	43	44
Germany—Berlin to Hamburg	37·3	40·5

The average rate for express trains may be taken as under, all trains running above 40 miles an hour being taken as 'express' in Great Britain and the United States, and all above 29 miles an hour on the Continent:

Great Britain	with stops	41·6	without stops	44·6
France	"	32·8	"	36·2
Holland	"	32·5	"	35
Germany	"	31·7	"	34·3
Belgium	"	31·7	"	33·5
Austria	"	30	"	32
Denmark	"	30	"	32
Italy	"	29½	"	31·2
Sweden	"	29	"	31·5
Russia	"	29	"	31·6
United States	"	41·4		..

On the Canadian Pacific line a special train to convey the Japanese mail in 1891 performed the distance from Vancouver to Brockville, opposite the New York frontier, in 77 hours, at a speed of 36 miles an hour for the whole 2800 miles. On the Grand Trunk line the best service is 36·8 miles including stops, and 38·2 excluding stops. The best service in India is from Bombay to Calcutta, about 25 miles an hour. The distance from Mel-

bourne to Sydney is run at 33 miles an hour including stops, and 37 miles excluding stops.

Fares and Rates.—The standard English passenger fares may be taken at about 1½d. per mile first class, 1¼d. per mile second class, and 1d. per mile third class. The experience over a series of years has shown a constant increase in the volume of third-class travel, which in 1890 formed ⅞ths of the whole passenger business in the United Kingdom. In 1872 the Midland Company decided on the abolition of the second class, and in 1890 the Manchester, Sheffield, and Lincolnshire Company and the Caledonian Company partly adopted the same policy. The Midland Company, however, by running Pullman drawing-room and sleeping cars at an extra fare, practically re-established the three classes. In the United States the average fare may be taken at 1½d. per mile, extra charge being made for drawing-room and sleeping cars. The following official statistics as to the comparative fares per kilometre in the different countries of Europe were published by the French government:

	First Class.	Second Class.	Third Class.	Free Baggage.
England	12·5 centimes.	9·5	6·5	27 to 54 kilogs.
France	12·3	9·2	6·7	30
Germany	11·2	8·7	6·2	25
Italy	12·4	8·7	5·6	none
Belgium	9·5	7·5	5·0	none

With regard to goods, the charges on British railways are higher on the whole, but the speed of the goods-trains and the character of the service is superior. With long hauls in some foreign countries of course lower mileage rates can be charged. The grain rates in America have been reduced to about ½d. per ton per mile, and on Indian railways, with cheap labour and fuel, a standard of ¼d. per ton per mile has been reached.

Capital, Revenue, &c.—The act of parliament authorising the construction of the Stockton and Darlington Railway, the first used for passenger traffic, received the Royal assent on 19th April 1821. The first rail was laid on 23d May 1822, and on 27th September 1825 the railway was opened with great ceremony. Four hundred and fifty passengers were conveyed in the first train. The train arrived at Darlington, a distance of 8¾ miles, in 65 minutes. When fifty years later the jubilee of the railway system was celebrated there were 16,449 miles of railway working in the United Kingdom, representing a capital cost of £600,895,000, and producing from traffic a revenue of £56,898,000, of which £24,893,000 was received from passenger fares and £32,005,000 from the conveyance of goods and minerals.

At the close of 1897 there were 21,433 miles of railway open for traffic. The authorised capital for the construction of railways was £1,089,765,095, of which English railways had £896,411,043, Scottish railways £153,887,595, and Irish railways £39,466,457. The total receipts of these railways were £93,737,054, of which £79,759,776 was taken in England, £10,438,957 in Scotland, and £3,538,321 in Ireland. Of the total capital stock of the railways in the United Kingdom, £103,061,275 is guaranteed, £279,321,045 debentures, £269,373,440 preferential, £425,501,582 ordinary stocks and shares, and £12,507,753 loans. The gross receipts of all the companies is derived from—passengers, £40,518,064; goods, £47,857,172; mails and parcels conveyed by passenger trains, £6,482,164; and miscellaneous items. The number of passengers carried was 1,030,420,201, of whom 935,159,878 were third-class. The total working expenditure was £53,083,804, equal to 57 per cent. of the gross receipts; the net receipts were £40,653,250, giving a percentage of 3·73 on the total capital. Of the working expenditure, £13,712,718 was for locomotive power; £4,371,121 for repairs and renewals of carriages, &c.; £8,610,686 for maintenance of permanent way, &c.; and £16,505,464 for traffic expenses. The railway companies paid £116,329 as compensation for personal injuries sustained in 1897, and £315,088 as compensation for damage and loss to goods traffic.

The railway system of the United Kingdom has not been developed according to any plan previously marked out, nor does it owe any of the position which it now holds to support or assistance given to it by the state. It is the outcome of private enterprise carried on in very many instances under great difficulties, in spite of much national and local prejudice, and at an expenditure of capital greatly in excess of that which would have been required under more favourable conditions. In 1830 the Duke of Wellington, then at the head of the government, was asked to appoint some engineers to lay out four or more main lines which would form the great highways for the locomotive. The duke's reply was that he did not like railways; and Mr Goulburn, the Chancellor of the Exchequer, declined to take any action in the matter, on the ground that interference with vested interests would create an amount of opposition which the government could not withstand. Private enterprise speedily supplied the impetus to railway development which the national government refused to give. The Liverpool and Manchester Railway was opened for traffic in 1830, and in 1838 there was a completed line between London and Birmingham. During the interval of the opening of these two lines—now absorbed in the London and North-Western system—fifty-six acts of parliament were passed authorising the construction of 1800 miles at a total estimated cost of 45 millions.

The Railway Mania.—A later period marked with greatly increased activity on the part of promoters and engineers culminated in the 'Railway Mania,' followed by a great financial collapse. Parliament had required as a condition precedent of considering any new railway bills that a deposit of ten per cent. of the estimated cost should be lodged with the accountant-general by the promoters, and five per cent. for parliamentary expenses. On the 30th of November in 1845, the latest date at which the Board of Trade would receive plans of new railways, there had been lodged 1263 bills, with plans and sections for new railways, representing a capital of 563 millions, and requiring the deposit of a total sum of 59 millions. The amount required for payment of the deposit exceeded by more than 20 millions the whole amount of gold and coin in the Bank of England and notes in circulation. The publication of these figures created alarm, and a panic ensued, the stocks of existing railways were greatly depreciated, and the premiums on the shares of the newly-promoted companies, which had been created by a wild spirit of speculation, disappeared, and wide-spread ruin and commercial disaster ensued. The result was that, of the 1263 companies which were promoted, 120 only survived the ordeal of parliament.

Railway Administration.—Up to 1891 there had been passed over 4000 separate acts of parliament authorising the construction of new or dealing with the constitution and working of existing companies. In order to compensate to some extent for the lack of original design and system in connection with the railways, the companies have resorted to numerous plans for amalgamation, fusion, purchase, or working agreements between themselves. There were in 1891, after numerous changes and dissolutions, 516 railway companies in the United Kingdom. Of the railways owned by these companies 266 are worked or leased by other companies. The

Great Western, for instance, has thirty-six railways of which it is the lessee, and has joint-ownership of nine other lines. The movement of the traffic over the separate systems of railways is provided for under the Clearing-house Association (see CLEARING-HOUSE); and in 1888 an act was passed giving to the Board of Trade authority to call for returns, and deal with the schedules of rates and classifications of the companies.

The earliest railways were authorised on the supposition that they would, like canals, be highways for the use of carriers. A scale of maximum tolls was prescribed in each act, and the canal classification of goods adopted. Later on the railway companies prepared a new classification. Each railway act also contained a clause authorising the railway company to charge a reasonable sum in addition to the maximum tolls, in order to cover carriers' services, risks, and profit; and from about the year 1845 each railway act prescribed a scale of maximum charges for conveyance. To these maximum rates most of the companies were allowed to add a terminal charge for the services of loading, unloading, covering, collection, and delivery, &c. Although the companies had thus power to charge certain rates, the *maxima* were seldom enforced: but even with the lower level of actual charges the traders were dissatisfied, and demanded frequent inquiries into the working of railways. Three such inquiries were held between 1866 and 1884, but the companies were on the whole acquitted of the charges brought against them. As the result of the inquiry of 1872 the Railway Commission was appointed to specially deal with disputes between traders and the railways. In 1885 the government made an attempt to deal with the whole subject of railway rates, but it was not until 1888 that an act was passed. The later part of 1889 and the whole of 1890 were occupied with inquiries before the Board of Trade and a joint committee of both Houses of Parliament, as to the rates and classifications of the railways, and the result has been acts which come into force on 1st August 1892, amending the powers and classifications of nine of the leading lines.

Zone System.—In 1889 a new departure was inaugurated on the Hungarian state railways by the introduction of the Zone system for passengers, under which each station, taken as a point of departure, is considered as the centre of certain zones, which increase in a regular ratio, and in which the fares are arranged on a simple plan. This was followed by the introduction on the Austrian railway system of the Kreuzer tariff, which is a combination of the Zone and the Kilometre systems: and in 1891 the Zone system was also applied in Hungary to the goods traffic.

Results of Railway Working.—At the time when the Liverpool and Manchester Railway was completed, ten miles an hour travelled by the fast stage and mail coaches was about the limit of speed attainable. At that time the population of the United Kingdom was about 25 millions; in 1891 it was nearly 38 millions. At the opening of the London and Birmingham Railway there were 3026 stage-coaches, 54 four-horse and 49 pair-horse mail-coaches in use. The full seating capacity of these vehicles, each being licensed to carry fifteen passengers, would represent 16,500,000 individual journeys in the course of the year, and it may be safely assumed that not more than 10 millions of such journeys were made. The extent of correspondence among the population was officially stated at 82 millions of letters. In 1890 the number of passengers carried on the railways was 817 millions. On the basis of work done by stage-coaches in 1837, we should require over a quarter of a million of these vehicles to move the passengers now conveyed over the 20,000 miles of railway. On 30th November 1839 the first of Her Majesty's mails was transferred from the mail-coach to the railway. The increased facilities thus afforded converted a uniform penny post from a theory into a reality when that system came into operation on 5th December 1839. In 1890 the Post-office celebrated the jubilee of the penny postage, and in that year carried 1650 millions of letters, 207 millions of post-cards, 442 millions of book-packets, and 159 millions of newspapers. To have conveyed this would have required more than thirty times the number of coaches which carried the mails half a century since. The news in those days was carried at an average speed of 8½ miles per hour. The railways carry the mails at an average speed of over 40 miles per hour.

The total traffic in coal on the railways of the United Kingdom amounted to over 126 millions of tons in 1890. Of the total meat supply of London the railway companies convey about 64 per cent.: whilst of milk four companies alone import about 22 millions of gallons each year. The supply of vegetables, fruits, and flowers for London and other large towns is also mainly dependent on the railways. The fish trade of the country also owes its development mainly to the railway facilities of recent years—in 1890, 383,000 tons of this valuable item of our food supplies were conveyed by rail from the ports to inland markets.

State Ownership of Railways.—It may be assumed in general that railway construction and development has been less hampered by state interference in the British Islands and in the United States and Canada than in any other parts of the world, and it is precisely in these countries that railways have attained their highest development. In other British colonies the government has either built or subsequently purchased the lines. Railway construction in France was undertaken in a much more methodical manner than in Great Britain. The country is partitioned out among six great companies, and competition has thus been entirely avoided. The government owns about one-third of the capital invested, and will ultimately about the middle of the 20th century become the absolute proprietor of the various systems. The state has the right to fix fares and charges, and to determine the amount of new mileage to be constructed from time to time. So far as technical skill is concerned, the railways of the country are well managed, but the accommodation provided is far inferior to that in Great Britain or the United States: passenger-trains are comparatively few and crowded, and the freight service is very slow. The main lines are very remunerative in their operations, but the local roads are mostly worked at a loss. In Germany the roads are owned and managed by the government, and political and military considerations are paramount in the working of the system. The lines have been cheaply constructed, the cost being less than half per mile that in Great Britain. The tendency in most other European countries is towards state ownership or control of railways. The Russian government since 1880 has been actively engaged in buying up private railways and building new lines, and at the present time some 40 per cent. of the system is owned by the state. In Belgium the whole of the lines have been so purchased by the government. In Austria only one line is a state railway.

Railways in the United States.—By far the greatest and most rapid development of railway construction in proportion to population has taken place in the United States, and the working of railways in all parts of the world owes much to the characteristic inventive genius of Americans. The building of railways has not been hampered on the

American continent by undue legislative restrictions. State ownership has never been seriously discussed; land has been cheap or free for occupation; the distances to be traversed are great, and it is small wonder, therefore, that the iron road has in most districts preceded or superseded the ordinary highway. Before the date of the celebrated locomotive trial which evolved the 'Rocket,' an engine was run in America called the 'Stourbridge Lion,' a machine made in England, and imported by the Delaware and Hudson Canal Railroad Company. The first railroad in the United States was, however, begun in 1828 by the Baltimore and Ohio Company, a section of 15 miles from Baltimore to Ellicott's Mills being opened in May 1830. Horse-traction was first used on this line. American engines are now found competing with English-built machines in many parts of the world, including the British-Australian colonies.

It is, however, in the matter of carriage construction that the American railroad engineer has marked out an independent path and obtained the most striking results. For many years European railway carriages adhered closely to the model of the old stage-coach. The longer distances travelled on the American continent, and the republican spirit which objected to the division of classes, led to the adoption across the Atlantic of the long railroad car, with a central passage between the seats. The great size and weight of these structures necessitated increased attention to such details as springs, couplings, and brakes, and in the provision of such accessories for comfort and safety American railroad practice has long been in advance of that in any other part of the world. Republican simplicity notwithstanding, the demand for improved accommodation gave rise to drawing-room, sleeping, and dining-room cars, and the stock turned out for these purposes by the Pullman and Wagner companies challenges comparison with the provision made for the travel of royalty in the Old World. The 'Vestibule' trains running on most of the trunk-lines for long distances—say between New York and Chicago—represent the highest ideal yet obtained of luxurious travelling. Railway stock of this character is mostly owned by independent companies, whose officials collect the extra fares for the accommodation.

In the United States, between 1830 and 1890, a total length of 167,000 miles has been constructed, or an average of nearly 2800 miles a year. Previous to 1850 the greater portion of the railroads made were in the states bordering on the Atlantic, and were for the most part isolated lines employed for local traffic. A great development to this form of enterprise was given by the discovery of gold in California, and lines were rapidly pushed towards the centre of the continent. The great civil war at the commencement of the next decade emphasised the necessity of direct communication with the growing Pacific states to cement the Union, and government assistance was freely given both in land-grants and money to the two companies, the Union Pacific and Central Pacific, which, building respectively from the east and the west, met near Salt Lake City in May 1869, the total length from the Missouri River to San Francisco being 1700 miles. Since that date five transcontinental lines have been completed, including the Canadian Pacific Railway on British territory. The rate of general railroad construction has varied considerably, but the most active period was that between 1880 and 1890. In 1882 11,569 miles were built, and in 1887 no less than 12,878. A large extent of this mileage was built in advance of the necessities of the districts traversed, and in other cases existing lines were paralleled to the heavy loss of the interests concerned. These periods of over-construction and resulting competition, combined with a necessary reduction of mileage rates as the centre of agricultural production moved westward across the continent, caused at times much depression in railroad securities. The system of finance under which the companies borrow money on mortgages with foreclosure powers (not possessed by owners of British railway debentures) has also been the cause of heavy loss to investors in American railroads, many of which have passed through the ordeal of reorganisation with the accompanying 'assessment' or 'wiping out' of junior securities.

To remedy the effects of over-competition, a system of 'pooling' receipts was adopted by the various trunk-lines. Under this plan the receipts from any given description of traffic were made into a common purse, and divided among the companies concerned in an agreed ratio. The state railroad commissions were powerless to deal with traffic originating or passing out of their respective territories; but in 1888 the Interstate Commerce Commission was appointed with federal authority to deal with questions affecting railway traffic. Under the law appointing the commission, 'pooling' receipts was made illegal, and the well-known 'long and short haul' clause, establishing uniform mileage rates, was, contrary to the result, expected to produce disastrous results to railway revenues.

The total railway capital in the United States in 1890 was $10,122,000,000, of which rather less than half, or $4,640,000,000, consisted of capital stock, and the remainder of different forms of indebtedness. The cost per mile of completed road was $59,638. The gross earnings were $1,097,847,000, equal to 10·8 per cent. on the investment, and the net earnings $346,921,000, or 3·4 per cent. on the outstanding capital. Of this amount 4·18 per cent. represents interest on indebtedness, while the average return in the way of dividend to stockholders was 1·80 per cent. The work done was represented in 1890 by 793,925,000 train miles run. Passengers were carried to the number of 520,439,000, and an average distance of 24·06 miles, while 701,344,000 tons of freight were carried an average distance of 112·91 miles. The average earnings per passenger per mile were 2·185 cents, and per ton of goods per mile 0·935 cents, the latter a lower average than in most other countries, the distances hauled being unusually great.

Colonial and Foreign Railways.—Canadian railways follow closely in their characteristics the construction and methods of working of the lines across the boundary. The return of 1890 gives a total of about 14,000 miles completed, the greater proportion of the mileage being divided between two companies, the Grand Trunk and the Canadian Pacific. The nominal capital, including advances made and aid granted by the Dominion government, was $786,447,000, or $56,174 per mile. The earnings were returned at $46,844,000, and the net profits at $13,930,000. Passengers were carried to the number of 12,82[illegible],000, and 20,787,000 tons of freight.

In Mexico for many years the line from Vera Cruz to the capital, constructed in 1850 at a heavy cost by British capital, was the only railway in existence; but routes connecting with the systems of the United States were subsequently constructed under American auspices.

Of railways in other Central American states the Panamá line constructed by American capital, as the first transcontinental route, claims chief attention. Other routes between the Atlantic and Pacific are under construction, and a great scheme, traversing the Isthmus from north to south, was discussed and steps taken for the necessary surveys at a meeting of representatives of the various republics held in 1890 at Washington. The project

vies in magnitude with the Trans-Siberian railway scheme in the Old World. The Argentine Confederation represents the chief railway development in the southern half of the continent.

In the early days of railway enterprise in India the agency of private companies guaranteed by the state was exclusively employed, and nearly all the great trunk-lines of the country were made under this system. The government gave the land for the lines free of charge, and guaranteed interest generally at five per cent. on the share capital and a lower rate upon the debentures for ninety-nine years. Any surplus earnings after the guaranteed rates were paid were divided equally between the government and the companies. Moreover, the government retained the right of buying the undertakings at specified dates on payment of the value of the stock calculated at its market price on the average of the three preceding years. In this way the East Indian Railway was acquired in 1880, the Eastern Bengal in 1884, the Sind, Punjab, and Delhi in 1885–86, the Oudh and Rohilkund at the end of 1888, and the South Indian in 1890. In 1870 a new policy of railway development by the direct agency of the state was inaugurated; and in 1880–81 the system of encouraging private enterprise by state assistance was again adopted. Both agencies are now employed. In some instances—notably the Bengal and North-Western line—railways have been constructed without any direct pecuniary assistance; in others a subsidy or limited guarantee has been granted. The agency of private companies has also been employed by the government both in the construction and working of state lines. In all cases the government has the power of taking over the railways at specified periods on stated terms. In 1884 a select committee reported in favour of a more rapid extension of railways than had been taking place, and recommended the broad gauge—i.e. 5 feet 6 inches—except in tracts where the metre or smaller gauge was already in successful operation, and for local lines where the traffic could only be light. The first railway opened in India was that of the Great Indian Peninsular Company from Bombay to Tannah, traffic being commenced on 4th May 1853, and at the close of 1890 there were 16,996 miles in working. Of this total 8077 miles were state lines worked by companies, 4680 miles state lines worked by the state, 2588½ miles were worked by guaranteed companies, 381 by assisted companies, 539½ miles were owned by native states and worked by companies, 124 miles were owned by native states and worked by state railway agency, 547¼ were owned and worked by native states, and 58¾ miles were in Portuguese and French territory.

The first railway in Australasia was projected in 1850 in New South Wales by private enterprise, but was completed by the government. With a few small exceptions the railways of the Australasian colonies are owned and worked by the governments. The dates of opening of the first lines and latest mileage returns of each colony are: Victoria (13th September 1854), 2762 miles; New South Wales (29th May 1855), 2182 miles; Queensland (31st July 1865), 2113 miles; South Australia (26th April 1856), 1810 miles; Western Australia (21st January 1864), 569 miles; New Zealand (1st December 1863), 1965 miles; Tasmania (10th February 1871), 374 miles. In Australasia in 1870 there were but 948 miles of railway, but in 1890 there were about 12,000 miles. The distribution of this total is shown above. It is unfortunate that in Australia different gauges have been adopted, so that where the systems join transhipment of goods and passengers is necessary. The Victorian lines are built on the 5 feet 3 inches gauge, which is also the national standard in South Australia, but this colony has also 700 miles on the 3 feet 6 inches gauge. In New South Wales a 4 feet 8½ inches gauge is the standard, but there is also a 5 feet 3 inches line. In Queensland, Western Australia, Tasmania, and New Zealand all the railways are on a 3 feet 6 inches gauge. The capital cost per mile of the Australasian lines has been: Victoria, £13,612; New South Wales, £12,532; Tasmania, £8436; New Zealand, £7582; Queensland, £6766; South Australia, £6444; and Western Australia, £4374 per mile. In Cape Colony the first railway was opened 26th June 1860, and when the government took over the railways in 1873 there were only 63½ miles; in 1890 there were 1890 miles.

In China the first short railway at Woosung was torn up after a few months' working, but the line to the Kaeping collieries was not disturbed. Some 100 miles of the Tien-tsin line has since been constructed, and plans are under discussion for the construction of a trunk route. See the articles on the several countries.

Railway Mileage.—The dates of the opening of the first railways, and the mileage in 1891, of the principal countries are as under:

Austria-Hungary	20th September 1828	16,467
Belgium	5th May 1835	3215
Denmark	18th September 1844	1223
France	1st October 1828	22,586
Germany	7th December 1835	25,969
Great Britain and Ireland	27th September 1825	20,073
Greece	18th February 1869	239
Italy	3d October 1839	8117
Netherlands	13th September 1839	1887
Norway	14th July 1853	970
Portugal	9th July 1854	1280
Russia	4th April 1838	19,027
Spain	30th October 1848	6127
Sweden	9th February 1851	1623
Switzerland	15th June 1844	1929
Turkey	4th October 1860	1096
Egypt	26th January 1856	1494
India	18th April 1853	16,996
United States	17th April 1827	167,000
Canada	19th March 1847	14,000
Mexico	8th October 1850	5827
Argentine Republic	14th December 1864	5798
Brazil	30th April 1854	5779
Chili	January 1852	1926
Colombia	January 1880	230
Paraguay	1st October 1863	149
Peru	29th May 1851	994
Uruguay	1st January 1869	537
Venezuela	9th February 1866	441

Rain. Whatever lowers the temperature of the air below the point of saturation, or the dew-point, may be regarded as a cause of rain. Various causes may conspire to bring about this change of temperature, but by far the most important of these originate in winds and other movements of the atmosphere. The more prominent principles of the connection of the winds to the rainfall are these: (1) When the winds have traversed a considerable extent of ocean before reaching land the rainfall is large; (2) when the winds, on arriving at the land, advance into higher latitudes or into colder regions the rainfall is largely increased, for the simple reason that the air is now more rapidly brought below the point of saturation; (3) if the winds, even though they arrive directly from the ocean, have not traversed a considerable breadth of it, the rainfall is not large—indeed, in the case of the sea-board of Lower California the mean annual amount, as at San Diego, is only 10 inches; (4) if the winds, even though they have crossed a great extent of ocean, yet on arriving at the land at once advance into lower latitudes or into warmer regions, the rainfall is small; (5) if a range of mountains lie across the onward course of the winds, the rainfall is largely increased on the side facing the winds, but reduced over the region on the other side of the range; the reason being that, as the air on the windward side of the ridge is suddenly raised to a greater height in crossing the ridge, the temperature is still more reduced by mere expansion, and a more copious precipitation is the consequence. On the lee side, as the air descends to lower levels, it gradually gets drier, and hence the rainfall of necessity diminishes with every stage of the descent to lower levels.

Attention may be here drawn to the diminished velocity of the wind over land as compared with the open sea, as has been fully shown by the observations of the *Challenger* expedition. From these it has been proved that an envelope of stiller air, or air of less velocity as compared with that of the ocean, broods over the land, and by its presence forces the wind blowing across the land to a greater height, thus augmenting the rainfall. This dragging effect of the land on the wind, and the important consequences resulting from it, explain how it is that during north-easterly storms of rain the foreshores of the Firth of Forth, Moray Firth, and Pentland Firth, which look to the north-east, receive a much heavier rainfall than other parts of Scotland in these circumstances. On the Ayrshire coast the annual rainfall at Ayr is 38 inches, but at Girvan it rises to 51 inches. Both stations are close to the coast, the only difference being that the hills to the eastward approach much nearer the coast at Girvan.

For short periods the heaviest rainfalls occur with thunderstorms, and with tornadoes, waterspouts, and other forms of the whirlwind, for the reason that not only is their rapid expansion due to the rapid ascent of the air, but also to great rarefaction produced by the extreme velocity of the gyrations of the air round the axis of the whirlwind. One of the heaviest rainfalls yet recorded in the British Islands was 2·24 inches in 40 minutes at Lednathie, Forfarshire, during a severe thunderstorm on 18th June 1887. At Camberwell, London, 3·12 inches fell in 2 hours 17 minutes on 1st August 1846. Of heavy falls during one day the following may be mentioned: Ben Nevis Observatory, 7·29 inches, 3d October 1890; Seathwaite, 6·78 inches, 8th May 1884; Tongue, 6·00 inches, 7th September 1870; Newport, Wales, 5·33 inches, 14th July 1875; and Camusinas, Argyllshire, 5·60 inches, 24th January 1868.

In the United States, where severe thunderstorms and tornadoes more frequently occur, the daily rainfalls repeatedly exceed these amounts. Thus, during the years 1885–89 the following heavy rainfalls of one day were recorded: Brownsville, Texas, 12·94 inches in September 1886; Pensacola, 10·70 inches, June 1887; Key West, 7·80 inches, September 1889; Chattanooga, 7·61 inches, March 1886; Shreveport, 7·54 inches, January 1885; and a day's rainfall of from 5 to 7 inches is repeatedly recorded in the United States. These amounts are greatly exceeded in lower latitudes. Thus, on the Khasi Hills, India, 30 inches on each of five successive days have been recorded; at Bombay, 24 inches in one night; and at Gibraltar, 33 inches in 26 hours.

As regards the ocean little is yet known from observation. This, however, is clear, that in the equatorial belt of calms between the regions swept by the two trades the rainfall of the ocean reaches the maximum; and the parts of the Atlantic and Pacific which are longest within the belt of calms as it shifts northward and southward with season have the heaviest ocean rainfall. But, though the cloud-screen is unquestionably dense and the rainfall frequent and heavy, the observations of the *Challenger* and the *Novara* show that the statements generally made as to these are very greatly exaggerated. Over the open sea in the regions of the trades the rainfall is everywhere small, owing to the circumstance that these winds are an immediate outflow from anti-cyclonic regions, their dryness being further increased since their course is directed in regions that become constantly warmer.

The trades, however, deposit a larger rainfall over islands and other land-surfaces which they traverse; the amounts being proportional to the height of the land, but more particularly to the degree in which the high land ranges lie across the paths of the winds. Thus, at Ascension, which is within the south-east trades the whole year round, the annual rainfall is 8·85 inches; and at St Helena on the coast 5·36 inches, but on the high land in the interior of the island it rises to 24 inches. In the western division of the Pacific, for some distance on each side of the equator, the rainfall is very slight, and extensive guano deposits are formed on Malden and other islands scattered over that region. In Mauritius, on the weather shore of the island, the annual rainfall is about 30 inches; but at Cluny, 16 miles inland, it is 146 inches, the latter place being in the neighbourhood of extensive forest-clad mountains.

The heaviest rainfalls of the globe are brought by the winds which have traversed the greatest extent of ocean within the tropics. These conditions are most completely fulfilled from June to September by the winds which, beginning their course from about 30° S. lat., blow home on southern Asia as the south-west monsoon, which accordingly distributes a heavier rainfall over a larger portion of the earth's surface than occurs anywhere else in any season. On these summer winds the rainfall of India chiefly depends, and the 'lie' of the mountain-systems with respect to the winds intensifies the effects. The following in inches are the annual amounts at different points in the west from Surat southward: Surat, 41; Bombay, 74; Mahabaleshwar, 263; Banca, 251; Honawar, 139; Calicut and Cochin, 115. In the west of Ceylon the rainfall is also large, being at Colombo 88, at Galle 90, at Ratnapura, inland among the hills, 150; but in the east of the island, before reaching which the monsoon is deprived of much of its moisture, it is considerably less, being at Mannar 91, at Jaffna 49, and at Trincomalee 62. The rainfall is also very large in Burma, being at Akyab 194, Sandoway 214, Diamond Island 119.

Rangoon 99, Tavoy 197, Mergui 162, and Port Blair 117. In the north-east angle of the Bay of Bengal, and thence north to Bhutan, where the summer monsoon curves to a westerly course up the valley of the Ganges, the rainfall is great, rising at Cherra-punji, in the Khasi Hills district, to 472 inches—or nearly 40 feet—being the largest known rainfall anywhere on the globe. Owing to this diversion in the course of the monsoon, the valley of the Ganges enjoys a generous rainfall. On the other hand, the rainfall is small over the plains of the Punjab, being at Multan 6·79, and at Kurrachee 7·25, increasing over the higher parts of the province, at Lahore 21, Umballa 36, Simla 70, and Dharmsala 122.

The key to the distribution of the rainfall over the East Indian Archipelago and Australia is the distribution of pressure from south-eastern Asia to Australia, with the resulting prevailing winds. During the winter months pressure diminishes rapidly from Asia southwards, and northerly winds prevail. Now, as these winds have travelled a great breadth of ocean, they arrive in a highly saturated state and deposit a heavy rainfall over these islands and the north of Australia. The degree to which these rains penetrate into Australia depends entirely on the strength of the winter monsoon. On the other hand, during the summer months pressure increases from Asia southwards, and southerly winds set in from Australia to Asia, distributing in their course a very large rainfall over the islands of the Eastern Archipelago, rising at several places to 30 inches a month. The small rainfall in such islands as Timor, which are more immediately sheltered, as it were, by Australia during these southerly winds, impresses on the region well-marked dry and wet annual seasons. These marked differences among the climates of this archipelago really depend on the geographical distribution of land and sea in this part of the globe, and must therefore be regarded as permanent differences, and as having played no inconspicuous part in the unique distribution of animal and vegetable life which is so characteristic of the archipelago. Since in the summer of the southern hemisphere the winds blow from the sea inland, and in the winter from the land seaward, it follows that generally the summer is the rainiest season. In the interior, along the Murray River and its affluents, the rainfall everywhere is necessarily small. In the north of New Zealand the winter rainfall is the heaviest, but farther south, where the wet westerly winds prevail with some constancy at all seasons, the rainfall is distributed pretty equally through the year, and is of course largest on the western slopes of these islands. Thus, while in the east it is at Dunedin 34 and at Christchurch 28 inches, in the west it is at Hokitika 120, and at Beaby, inland, 106 inches.

Europe as regards its rainfall may be divided into two regions—the countries bordering on the Mediterranean, and the rest of the continent. A vast ocean on one hand, a great continent on the other, and a prevalence of westerly winds rule the distribution of the rainfall in western and northern Europe. Now, since these westerly winds have traversed a vast extent of ocean before arriving at the land, they distribute a large rainfall, particularly on hilly regions opposing their course. Thus, over a large part of the Highlands of Scotland more than 80 inches fall annually, and over fully one-third of the British Islands the annual amount exceeds 40 inches. On the other hand, in eastern districts on the lee side of the great mountain-ranges, the rainfall does not exceed 30 inches over a large portion of England, and in some of the best agricultural districts of Scotland. In the west of Norway it is 72 inches at Bergen, 46 inches at the Lofoden Isles, and 10 inches at the North Cape; over large portions of Sweden it is 21 inches, and in Russia and Siberia it varies from 20 to 2 inches. Spain presents great extremes, from 70 in the north-west to 13 inches at Saragossa. In the plains of France and Germany it varies from 20 to 35 inches, rising, however, on approaching the Alps to more than 100 inches. In western Europe the greater part of the rain falls in winter, but in the interior of the continent in summer. The summer climates of the extreme south of Europe and in the north of Africa, situated at comparatively low levels, are practically rainless, owing to the northerly winds that set in with considerable force at this time of the year towards the heated plains of the Sahara.

The summer winds in the south-east of the United States are southerly; and, as they have previously traversed a considerable extent of ocean, they arrive well but not super-saturated, and pour down a monthly rainfall of 6 inches or more from Louisiana to Chesapeake Bay. The comparative equableness of the rainfall over the eastern states is the result of no mountain-ridges lying athwart their path and of the winds passing into higher latitudes and therefore cooler regions. Again, the distribution and amount of the summer rainfall in the west and north of the United States is really determined by the low atmospheric pressure which has its centre in the region of the Rocky Mountains. To the west of this low pressure winds are generally north-westerly, and as they thus pass into hotter regions the summer rainfall in these parts of the United States and Canada is either nothing or very small; whereas on the east side winds are southerly, and the rainfall consequently equals, or even exceeds, that of the finest agricultural districts of Great Britain.

As regards the rainfall of the two extreme months, January and July, the following show in inches the amounts for various places: Vera Cruz, 5·10 and 35·90; Para, 6·51 and 3·26; Manaos, 7·33 and 1·82; Buenos Ayres, 2·37 and 1·70; Corrientes, 5·24 and 2·67; and in Africa, Alexandria, 1·95 and 0·20; Algiers, 4·43 and 0·04; Senegal, 0·28 and 3·00; Sierra Leone, 0·69 and 24·20; Capetown, 0·28 and 3·83; Durban, 5·00 and 1·70; and Zanzibar, 2·02 and 2·35. The explanation of these and similar differences is found in the seasonal changes of the wind. The South African colonies present the strongest aspects of climate, so far as the rainfall is concerned, being divided into two totally distinct classes, the climates of the Natal coast and of the inland regions where the rains occur during the summer months, and the climates of the other regions where the rains fall chiefly during the winter months. The driest region of Africa is doubtless the Sahara, and the wettest the region from the Victoria Nyanza northwards, including the gathering-grounds of the Nile.

See METEOROLOGY, RAIN-GAUGE; also BLOOD-RAIN, and, for showers of frogs and fishes, SHOWERS. For maps of annual rainfall of the globe, see Loomis in *Silliman's Amer. Jour. Sci.*, Murray in *Jour. Roy. Scot. Geo. Soc.*, and Hann in *Climatological Atlas*. For particular countries, Symons, and Buchan for the British Islands; Raulin for France and Algiers; Blanford and Elliot for India; the Dutch for East India Islands; Tod, Russell, Hector Ellery, and Wragge for Australasia; the Signal Service for the United States; Carpmael for Dominion of Canada; the Meteorological Services of the different European countries, &c.

Rainbow. The rainbow is the best known of all optical meteorological phenomena, consisting of a coloured arch formed opposite the sun on falling raindrops, and visible whenever the necessary conditions of a passing shower on one side and a clear and not too high sun on the

other occur. Two bows are frequently seen, each exhibiting the full spectrum of colours from red to violet; but in the inner or primary bow the red is the outer edge and violet the inner, while in the outer or secondary bow the order is reversed, the red being inside and the violet on the exterior. The colours are always arranged in a definite order, that of the solar spectrum—viz. red, orange, yellow, green, blue, indigo, and violet, but shade imperceptibly into each other. The cause of this breaking up of the sunlight into its constituent colours is explained in most physical and meteorological text-books (see *Light*, by Professor Tait, chap. x., or *Meteorology*, by E. Loomis, par. 416), but may be briefly summarised as follows:

For the primary bow (fig. 1), let PQR represent the section of a raindrop, and SP a ray of light falling on it. The ray enters the drop at P, meets

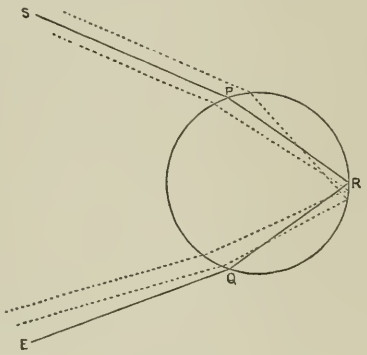

Fig. 1.

the surface again at R, is reflected to Q, where it leaves the drop in the direction QE. The ray is refracted or bent on entering the drop at P and again on emerging at Q—the amount of this refraction depending on the acuteness of the angle at which the ray meets the surface. Now it may be shown that there is a particular point P, such that any ray from S striking the surface below P emerges again above Q, and any ray above P also emerges above Q—the former owing to the more acute angle of the reflection, and the latter to the greater refraction on entering and leaving the drop. The course of two such rays is shown by the dotted lines in fig. 1. Q is thus a turning-point in the emerging rays, and near it a very large number of rays pass out, and an observer at E sees a bright image of S in the direction EQ. This statement applies to any one colour of sunlight; but, as the refrangibility increases from red to violet, the latter is bent more at P and Q, and the line EQ lies at a flatter angle. The observer, therefore, sees the violet rays reflected on drops at

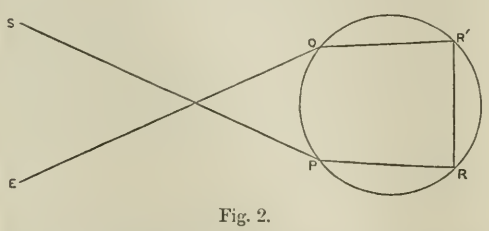

Fig. 2.

a less altitude than those that reflect the red, the other colours being intermediate. The raindrop being spherical, this reflection takes place in all directions, the fixed condition being the radius of the bow, that is the angle between the line from the observer to the bow and that passing from the sun to the observer, or, in other words, the observer's shadow. For red light this angle is 42° 39′, and for violet 40° 13′. If the sun were a luminous point each colour would be sharply defined, but as the disc of the sun subtends an angle of about 30′ each colour is broadened to this amount, and they overlap.

Exactly similar reasoning explains the secondary bow (fig. 2). The light that forms it has been twice reflected, at R and at R′, the point Q lies above P, and rays entering either above or below P all emerge below Q. A glance at the diagram will show that the greater bending of the more refrangible rays makes the line EQ more nearly vertical, and therefore the violet rays form the outer edge and the red the inner of the secondary bow. The radius of the red is 50° 5′, and of the violet 54° 0′. The space between the bows gets no reflected light, but that inside the primary and outside the secondary is faintly illuminated by rays such as are indicated by the dotted lines in fig. 1 and their equivalents in fig. 2, which are not shown. These rays 'interfere' (see INTERFERENCE) with each other, and cause alternations of colour which appear as spurious bows inside the primary and outside the secondary. They can only be seen with strong sunlight and small drops of rain.

The radius of the primary bow being roughly 40°, it is evident that it cannot be seen when the sun is at a greater elevation than this, as the highest part of the bow would lie below the horizon. Hence in the latitude of Edinburgh rainbows cannot be seen for several hours about noon at the time of the summer solstice. If the drops of water be very small the interference of the rays causes such a complete overlapping of the colours that the bow appears white: this is the case generally with a fog-bow.

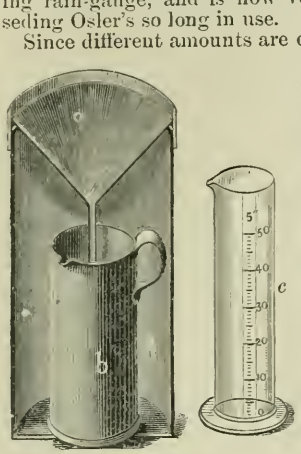
Intersecting rainbows have frequently been seen. When the sun is reflected from a surface of still water a bow is formed by the reflected image as well as by the sun itself. Lunar rainbows often occur, but the feebleness of the moon's light usually prevents any colours being observed. There are many popular weather prognostications connected with rainbows, all dependent on the fact that they imply local passing showers. 'A rainbow in the morning is the shepherd's warning: a rainbow at night is the shepherd's delight,' is easily understood when we remember that the rainbow is formed opposite the sun, and that weather-changes in the British Islands generally pass from west to east.

Rainey's Corpuscles. See GREGARINIDA.

Rain-gauge. Rain-gauges measure the quantity of rain which falls, and are of various constructions. One of the best is that known as Symons' rain-gauge, consisting of a funnel-shaped receiving vessel, and a glass measure of much smaller diameter so as to allow as nice graduation as may be desired. In the fig. *a* is the funnel-shaped receiving vessel (shown in section in the fig.), 5 inches in diameter, with an upright, sharp-edged and strong rim, in order that it may retain its circularity; *b*, the vessel which receives the rain collected; and *c*, the graduated glass measure which measures the amount in tenths and hundredths of an inch. If desired it may be graduated to still greater nicety. Another excellent gauge is one which is a modification of Glaisher's gauge, brought into use by the Meteorological Office. The diameter of this gauge is 8 inches, and there is added to it a vertical cylinder on the top of the

receiving funnel, to retain the snow as it falls and prevent its being blown out of the gauge, as is likely to happen when the funnel is shallow. Beckley's is perhaps the best continuously recording rain-gauge, and is now very generally superseding Osler's so long in use.

Since different amounts are collected at different heights above the ground, it is indispensable, if uniformity and comparability is to be attained, that the rims of rain-gauge be placed at one uniform height above the ground. The height now generally adopted is 12 inches. The points it is necessary to secure at the height adopted are (1) the prevention of in-splashing as the rain-drops strike the ground and are broken into minute droplets, a large number of which in their second descent fall into the gauge; (2) the prevention of out-splashing, which occurs when the funnel is very shallow; and (3) the protection of the gauge as much as possible from strong winds, which so seriously interfere with the amount collected, by placing it as near the ground as can be done consistent with the prevention of in-splashing. These conditions are best fulfilled by using the gauges named, and placing their rims 12 inches above the ground. It has been proved from carefully conducted experiments that rain-gauges with diameters varying from 3 inches upwards collect amounts, when in positions exactly similar, within about 3 per cent. of each other. Accordingly, gauges with diameters exceeding 8 inches insure no greater accuracy than smaller ones, being only really required in the case of continuously recording gauges to hold the self-registering apparatus. On the other hand, gauges of from 3 to 5 inches diameter, such as Fleming's and Jagga's, give good trustworthy results.



Symons' Rain-gauge.

Special care should be taken that the gauge and its glass measure be kept clean; that it be firmly fixed and the rim kept in a horizontal position; and that it be made of a material which will stand exposure to the weather well. It should be placed in a situation as open as can be secured for it, particularly towards the directions from which the rain chiefly comes; and in each case it should be as distant from any neighbouring house, tree, or other object at least as far as the height of the object itself.

Rainier, Mount, or Tacoma, one of the highest peaks of the Cascade Range (q.v.), was in eruption during part of 1894.

Rainy Lake, forming a portion of the boundary line between Ontario and the United States, lies west, and 100 miles distant from the nearest point, of Lake Superior, and is about 50 miles long. It discharges by Rainy River into Lake of the Woods. There were gold finds on the Canadian side in 1896–97.

Raipur, a town in the Central Provinces of India, standing on a plateau (950 feet), 180 miles E. of Nagpur, has numerous tanks and groves, an old fort (1640), and a trade in grain, lac, cotton, &c. Pop. 23,759.

Raised Beaches. See Beaches (Raised), Upheaval.

Raisins are dried grapes, used for cooking, for dessert, and in the manufacture of wines. They are produced in largest quantities in the south-eastern provinces of Spain—Malaga, Alicante, and Valencia—and in Asia Minor—the islands of Cos and Samos—and the adjacent districts on the mainland; smaller quantities are grown in Provence, Southern Italy, the islands of the Greek Archipelago, and Crete. Currants (q.v.) are a small and peculiar variety produced in Greece, in the Morea, and the Ionian Islands. The grapes intended for raisins are dried either on the vines, after the stalks of the bunches have been partly cut through, or spread out on the ground; it is only in case of continued bad weather or persistent want of sunshine that they are dried by artificial heat. The better qualities are left on the stalks and dried in bunches; these are exported for use as dessert. All less estimable qualities are intended for cooking purposes, and, to a less extent, for the preparation of artificial wines or the improvement of wines of inferior quality. Raisins are rich in sugar, and it is this property that makes them serviceable to the manufacturers of wine. The bunches intended for table use are sometimes dipped in water upon the surface of which swims a layer of olive-oil, or in a strong potash lye. The object is to make the skin soft and give it a glossy lustre. The raisins grown in Spain are large and blue, and are known in the market as 'Malaga raisins' and as 'lexias,' the former for dessert, the latter for cooking. The raisins of Asia Minor are shipped principally at Smyrna (q.v.), and embrace the Elemé and similar varieties, which are long and light brown in colour, and sultanas, small light-brown grapes, with a thin and delicate skin and no seeds or kernels. Britain imports in all annually from 493,600 cwt. (1886) to 653,100 cwt. (1887), valued at £813,000 (1886) to £1,022,400. From Spain Britain imports every year raisins to the average value (ten years ending 1889) of £808,370, and from Asia Minor to the value of £399,300 (1889). Of late years raisins have been successfully dried in California; but in 1890 the United States still imported raisins to the amount of 36,914,330 lbs., of the value of $1,997,103.

Rájah, or more correctly Rája (from the Sanskrit *rájan*, 'king,' cognate with the Lat. *reg-* of *rex*), originally a title which belonged to princes of Hindu race who, either as independent sovereigns or as feudatories, governed a territory. Now, however, the title has a much wider extension: it is used of independent sovereigns, of subject or 'protected' princes, of petty chiefs, of great landowners, and of some persons of eminence who are neither rulers nor landowners.

Rajamahendri (formerly often spelt *Rajahmundry*), a town of India, in the presidency of Madras, stands on the left bank of the Godavari, 30 miles from its mouth. It has a museum, a provincial school, two gaols, and some Christian churches. From 1753 to 1758 it was held by the French. Pop. 24,555.

Rajmahal, a decayed town of India, stands on a steep eminence on the right bank of the Ganges, 170 miles NNW. of Calcutta. It was long the chief town of the Bengal and Bahar provinces, but is now deserted and ruinous, being only noteworthy for the remains of its palaces, formerly belonging to Shah Shuja and Kasim Ali, and as a station in an important transit trade. Its commercial value has been lessened in consequence of the Ganges often shifting its bed at this point. In the beginning of the 19th century it had 25,000 inhabitants, and now only about 4000.

Rajon, Paul Adolphe, an etcher, was born at Dijon in 1842, and trained in Paris, partly at the School of Fine Arts. About 1865 he turned to etching, and gained immediate success with his first plate, 'Rembrandt at Work,' after Meissonier. Standing in the front rank of French etchers, he won several medals at the Salon exhibitions, and produced numerous beautiful etched portraits and plates for books. In 1872 he visited England, and published in London in 1873 a portrait of J. S. Mill after Watts, as well as in subsequent years many other plates. His greatest achievements were 'The Emperor Claudius,' a picture by Alma Tadema, the portrait of Darwin by Ouless, and those of Tennyson, Joachim, and Mrs Anderson Rose by Watts. He died at Auvers-sur-Oise on 8th June 1888. See *Twelve Etchings by P. A. Rajon*, with Memoir by F. G. Stephens (1889).

Rajputana, an administrative territory of India, embracing twenty native states and the British district (2711 sq. m.; pop. 460,722) of Ajmere-Merwara. It lies between Sind (on the W.), the Punjab (on the N.), the North-western Provinces (on the E.), and several native states of Central India (on the S.). Its total area is 132,461 sq. m., and its total pop. (1881) 10,268,392; (1891) 12,089,330. The most important of the native states are Jaipur, Jodhpur (or Marwar), and Udaipur (or Mewar); next follow Ulwar (Alwar), Bhartpur, Kotah, and Bikaner. This region is crossed by the Aravalli Mountains, and consists in great part of sandy, barren plains, though there are of course numerous fertile valleys and other tracts. It gets its name from the ruling race or predominant Aryan tribes, called Rajputs. They are a proud aristocracy, own the soil, and have furnished ruling dynasties to very many of the native states of India. Yet in 1881 they numbered only 479,554. At the time of the Mohammedan invasions in the 11th century the Rajputs ruled over half-a-dozen strong states—Kanauj, Ajmere, Anhilwara, Udaipur, and Jaipur. From the end of the 16th to the middle of the 18th century these states acknowledged the supremacy of the Mogul emperor of Delhi. Then they were made to recognise the Mahrattas as their masters: since the Mahrattas were crushed by the British the Rajput states are independent allies.

Rajshahi. See Rampur Bauleah.

Rakoczy March, a simple but grand military air by an unknown composer, dating from the end of the 17th century (see National Hymns), said to have been the favourite march of Francis Rakoczy II. of Transylvania. The Hungarians adopted it as their national march, and in 1848 and 1849 it is alleged to have had the same inspiriting effect on the revolutionary troops of Hungary as the *Marseillaise* had on the French. The air most generally known in Germany and elsewhere out of Hungary as the Rakoczy march is one by Berlioz in his *Damnation de Faust;* Liszt also wrote an orchestral version of the original.

Rakshas. See Demonology.

Raleigh, the capital of North Carolina, is near the Neuse River, 186 miles (by rail 271) SSW. of Richmond. The town is regularly built on an elevated site, with a central Union Square, from which four principal streets radiate, each 99 feet wide. In the square stands the capitol, a large domed building of granite, which cost over $500,000. The city contains also state institutions for the blind, deaf and dumb, and insane, a gaol, and has iron-foundries, machine and car shops, and manufactories of clothing, carriages, and farming implements. Pop. (1880) 9265; (1890) 12,798.

Raleigh, Sir Walter, the typical gallant and hero of England's heroic age, was born of an ancient but decayed family at the manor-house of Hayes, near Budleigh in East Devonshire, in 1552. He was the second son of his father's third wife, who herself had been married before, and had borne her husband the famous Humphrey and Adrian Gilbert. He entered Oriel College, Oxford, in 1566, but left without a degree, most probably in 1569, to volunteer into the Huguenot cause in France. Here he served his apprenticeship to arms, but, beyond the fact that he was present at Montcontour, we know little of this period of his life. In 1578 he joined Humphrey Gilbert's luckless expedition, having most probably already crossed the Atlantic; and early in 1580 he landed in Cork at the head of a troop of one hundred foot to act against the Irish rebels. He quickly attracted notice by his dash and daring, took part in the assault of the fort at Smerwick and subsequent massacre of the six hundred Italian and Spanish prisoners, and seems to have approved thoroughly of all the drastic measures taken by the government to stamp out rebellion. He saw some months of further hard and thankless service in Munster, but in December 1581 returned to England.

He now made his entry to the circle of the court as a protégé of the favourite Leicester, and in February 1582 accompanied him in his convoy of the Duc d'Alençon to the Netherlands. Almost immediately after his return he became prime favourite of the queen, whose heart was still susceptible despite the weight of almost fifty years. Fuller's well-known story of how he first caught her eye by flinging down on the ground his fine plush cloak to save her feet from the mire is most likely completely apocryphal, but well befits the romantic temper of the times and the manner of fantastic devotion with which the Virgin Queen loved to be wooed or worshipped by the fine gentlemen of her court. Raleigh was now in the prime of manly beauty; his tall and handsome figure, dark hair, high colour, lofty forehead, resolute and manly bearing, alert expression, and spirited wit combined to form an imposing personality, and all the advantage that nature had given him he heightened by a gorgeous splendour in dress and in jewels. But he was proud, haughty, and impatient, and everywhere, save in his native Devonshire, the broad accent of which he preserved all his life, he made himself a multitude of jealous and envious enemies. He was consulted confidentially on Irish affairs, but never to the last took a public place in the queen's counsels, perhaps because his royal mistress, with all her fondness, distrusted his ambition, and divined that he lacked that sagacity of the statesman which she recognised in the less splendid Burghley and Walsingham. The playful name of 'Water' by which she called him seems itself to imply a recognition of that instability of character which was his constant foible and, in the fullness of time, the occasion of his ruin. But meantime she heaped her favours lavishly upon him: in April 1583 he received two estates; next month the 'farm of wines,' a license duty of twenty shillings a year from every vintner in the kingdom, which at one time yielded £2000 a year; and in March 1584 a grant of license to export woollen broadcloths, which Burghley estimated had yielded him in the first year as much as £3950. About the close of 1584 he was knighted; in July 1585 he was appointed Lord Warden of the Stannaries, in September Lieutenant of Cornwall, in November Vice-admiral of Devonshire and Cornwall; and in the same year he was elected to parliament as one of the two county members for Devonshire. In 1587 he succeeded Sir Christopher Hatton as Captain of the Queen's Guard. During the summer of 1584 he leased of the queen the stately mansion of Durham House, spent much money on its repair, and kept it as his town-house from that time down

to 1603. It was not till about the beginning of 1592 that he came into possession, on a ninety-nine years' lease, of the splendid park and castle of Sherborne alienated from the see of Salisbury.

In 1583 Raleigh risked £2000 in Sir Humphrey Gilbert's last ill-fated expedition, and on the news of his half-brother's loss took up a fresh charter of discovery and colonisation. In April 1584 he sent out a fleet under Amadas and Barlowe to explore the coast north of Florida. They made a prosperous voyage, and formally took possession of a district to which Elizabeth was pleased to give the name Virginia. Next year Raleigh fitted out a stronger expedition under Ralph Lane and Sir Richard Grenville, but the hundred men who lived a year under Lane's command on the island of Roanoke returned to England in Drake's fleet completely dispirited with their hardships. Soon after they set sail, Sir Richard Grenville arrived with three ships, and left on the island fifteen men well furnished with stores. One of the hundred colonists—the first citizens of America—Thomas Hariot, in his account of the colony and the causes of its failure, speaks of the herb, 'called by the inhabitants *Yppowoc*,' which was destined to become one of the closest comforts of life to half the world. Raleigh himself took to the new luxury, and would enjoy it in pipes of silver, the queen sitting by him while he smoked. In May 1587 he sent out three ships, under Captain Charles White, with 150 colonists, seventeen of whom were women. They found the fifteen men had perished, and ere long misfortune after misfortune overtook themselves. White returned to England for supplies, and at length, after many delays and difficulties, reached Virginia in August 1590 to find the settlement ruined and the colonists dispersed, never afterwards to be seen. It was the last direct attempt of Raleigh himself at the colonisation of Virginia. The undertaking, says Hakluyt, 'required a prince's purse to have it thoroughly followed out'—it is supposed that Raleigh himself had spent forty thousand pounds upon it.

Already in May 1587 the appearance of the handsome young Earl of Essex at court had endangered Raleigh's paramount place in the favour of the queen. Hatton and Leicester long ere now had shown their jealousy of him, but this impetuous and petulant boy openly flouted him, and at length drove him from the court to Ireland. He had already received in the spring of 1587 a grant of 42,000 acres in Munster, and with characteristic vigour he at once set about repeopling this tract with English settlers. He was in Ireland when the Invincible Armada appeared in English waters, but he hastened to the south of England to superintend the coast defence, and he was present with the fleet a trusted counsellor throughout that glorious week of toil and triumph. His vessels scoured the seas in privateering enterprises, which gratified at once his inborn hate of Spain and helped to provide the means for his vast expense and his Virginian ventures. His over-zealous seamen sometimes transgressed the forbidden limit of piracy, but the Treasury winked at such accidents or made itself a receiver by claiming a share of the plunder. Raleigh sailed with Drake on his Portugal expedition of 1589, but by the autumn of that year was again in Ireland, where he quickly became a warm friend of Spenser, with the endless fame of whose great poem his name is imperishably linked. The poet had settled on his estate at Kilcolman three years before, and here the 'Shepherd of the Ocean' [Raleigh] visited him, and read him his poem of *The Ocean's Love to Cynthia* [Elizabeth], which Mr Gosse thinks must have contained at least 10,000 lines, the extant 130 stanzas being a fragment. In *Colin Clout's Come Home Again* we read how Raleigh carried the poet into the presence of the queen, who took delight to hear his poem, and commanded it to be published. In his Youghal garden during this breathing-space Raleigh planted tobacco, as well as the first potatoes that grew on Irish soil. He quickly recovered all his influence at court, and busied himself with further schemes for reprisals on the Spaniards down to the moment of his fall. His famous tract, *A Report of the Truth of the Fight about the Iles of the Açores this last Sommer*, appeared anonymously in 1591. It is a splendid piece of heart-stirring prose, and three hundred years later it gave the inspiration to Tennyson's noblest ballad. Early in 1592 Raleigh prepared a new expedition to seize the Spanish treasure-ships, but again his doting mistress forbade him to sail with the fleet, which he had reluctantly to entrust to Frobisher and Sir John Borough. Hardly had he returned before she seems to have discovered his intrigue with Bessy Throckmorton, one of her own maids-of-honour—an infidelity to her own supremacy which her jealous temper could not brook. In July 1592 Raleigh was committed to the Tower, and it was more than four years before he was again admitted to his mistress' presence. He bore his imprisonment with characteristic impatience, and vexed the air with exaggerated complaints of his loss expressed in the fantastic fashion of the time. Meantime Borough had captured the *Madre de Dios*, a huge carrack, which he brought into Dartmouth in September. So great was the excitement and such the rapacity of the vultures that gathered to the spoil that none but Raleigh could control the tumult. He was sent down to Dartmouth with a keeper, and Sir Robert Cecil describes with astonishment his popularity and influence among his sailors and his countrymen. 'But his heart is broken,' he writes his father, 'for he is extremely pensive longer than he is busied, in which he can toil terribly.' Raleigh now married Bessy Throckmorton, and for the next two years lived with her in quiet happiness, building and gardening at Sherborne. About 1593 his imagination seems first to have been fired by the descriptions of Guiana, with its vast city of Manoa and its El Dorado, and in 1594 he sent out Captain Whiddon to Trinidad to make inquiries for him. In February 1595 he himself sailed with five ships, explored the coasts of Trinidad, sailed up the Orinoco, and had his imagination set aglow for life by the tropical splendours of vegetation that he saw, and still more by the auriferous quartz and glittering stones he found, and marvellous stories of stores of gold beyond brought to him by the native Indians. Six months after his return he sent Captain Lawrence Keymis to make further explorations, and later Captain Berry, but he himself failed to rouse any great public interest in England in his splendid dream of a new world and untold wealth from the mines of Guiana. Early in 1596 he published *The Discovery of the large, rich, and beautiful Empire of Guiana* (Hakluyt Society, edited by Sir R. Schomburgk, 1848), a splendid piece of vigorous prose. In June 1596 he sailed in the expedition under Howard and Essex to Cadiz, and it was his advice that governed the whole plan of action in that splendid triumph which a second time shattered the naval strength of Spain. His faults ever fell from him in the hour of action, but never before or again in life did he show such tact and temper as in the skilful persuasions by which he forced the Lord Admiral and Essex to agree to his plans. Yet he was mortified to the heart, as he lay in his ship suffering from a wound in the leg, when their lack of energy allowed the Spaniards, two days later, to burn the whole fleet of treasure-laden

carracks before his eyes. His spirited *Relation of Cadiz Action* remains the best history of the exploit. Despite his heroic conduct, it was almost the midsummer of 1597 before Raleigh was again admitted to court and allowed to take up his place as Captain of the Guard. Cecil showed himself friendly to him, and Essex was glad of his support in his desire for a more active opposition to Spain. Raleigh at once set himself to prepare and victual ships for the projected expedition, which at length, in July 1597, was permitted by the queen to set sail from Plymouth. A desperate storm compelled many of the ships to put back for shelter, but at length Raleigh met Essex off the island of Flores. They agreed to attack together the Isle of Fayal, and Essex sailed off first, but Raleigh reached the harbour before him, and, after waiting three days, on the fourth landed his men and carried the town by storm. Next morning the squadron of Essex made the harbour, to find all the laurels of the 'Island Voyage' already reaped. Essex's mortification was great, and was made greater by his cold reception at home. His surly temper grew upon him, and soon his helpless failure in dealing with Tyrone's rebellion in Ireland and his insane attempt at an insurrection in the streets of London brought him to the block. His hatred of Raleigh had become so desperate that he charged him, together with Cecil and Cobham, with a plot to murder him in his house—an absurd accusation, which Sir Christopher Blount on the scaffold confessed was 'a word cast out to colour other matters.' In 1600 Raleigh succeeded Sir Anthony Paulet as governor of Jersey, and in his three years' rule did much to foster its trade and relieve its fiscal burdens. About this time also he was active in parliament, advocating freedom of tillage, and of church-going, and the repeal of the more vexatious monopolies. His Irish estates he sold in 1602 to Richard Boyle.

In the dark intrigues about the succession that filled the closing years of Elizabeth's reign Raleigh took little part, while the crafty Cecil and the faithless Lord Henry Howard got the ear of James, and for their own advantage poisoned his mind against Raleigh and Cobham. The king had long been an admirer of Essex, and no doubt knew from the beginning that Raleigh was indifferent to his cause. The cowardice, timid love of peace, and the whole personal habits of the royal pedant, as well as his overweening conceit of his own judgment in affairs of state, were all naturally repugnant to the bold, self-reliant hero who had so long been a trusted confidant of the great-hearted queen. He met James on his southward progress at Burghley in Lincolnshire, and was greeted with a wretched pun worthy of its source—'On my soul, man, I have heard but *rawly* of thee.' Ere long he was stripped of, or forced into resigning, all his offices, the captainey of the Guard, the wardenship of the Stannaries, the wine-license monopoly, the governorship of Jersey. All this must have cut Raleigh to the heart, and as he was at no time guarded in his tongue it is possible enough he may have in his haste spoken, or at least listened to, words expressing a preference for Arabella Stuart to the rule of the Scottish king. But the only witness against him was the miserable Lord Cobham, and he made and unmade his eight several charges with such facility as to make them of no value at all. Neither in the 'Main' nor the 'Bye' Plot was there any really adequate evidence of Raleigh's complicity, and the refusal of the crown to allow him to be confronted with his accuser is of itself almost enough to justify belief in his innocence. 'But one thing,' says Kingsley, 'comes brightly out of the infinite confusion and mystery of this dark Cobham plot, and that is Raleigh's innocence.' Raleigh was arrested on the 17th July, and in his first despair tried to kill himself. The trial began at Winchester on November 17th, the prosecution conducted by the attorney-general, Sir Edward Coke, who disgraced his robe by a brutality almost beyond belief. Raleigh's defence was splendid, and for the first time in his life he made his way into the hearts of all Englishmen by the dauntlessness of his bearing and the burning eloquence of his words. Coke could call him 'a monster,' 'a viper,' 'the rankest traitor in all England,' 'damnable atheist,' and 'a spider of hell,' and Chief-justice Popham could jeer at him as an atheist as well as traitor; but it was too much for Englishmen to believe that the hero of Cadiz and of Fayal had 'a Spanish heart,' and all his unpopularity fell from him from that hour. Dudley Carleton, who heard the trial, wrote that when it began he would have gone a hundred miles to see Raleigh hanged, but ere it was closed he would have gone a thousand to save his life. Yet he was condemned to death, and only on the scaffold was his sentence commuted to perpetual imprisonment. Sherborne he had conveyed to trustees for his wife and eldest son, but an invalidity in the deed of conveyance was soon found, and the unhappy wife's application to the king was met with the words, 'I maun hae the lond, I maun hae it for Carr.' In January 1609 it was given to the favourite, a payment of £8000 being made as compensation. Within the Tower Raleigh employed himself with study and with chemical experiments, and was treated on the whole with fair indulgence. The young prince Henry came often to him, for he greatly admired the noble captive: 'No man but my father would keep such a bird in a cage,' said he. But he died in November 1612, and the promise he had wrung from his father to release Raleigh the next Christmas was only remembered to be forgotten. The chief fruit of Raleigh's imprisonment was his *History of the World*, the first and only volume of which, extending to over 1300 folio pages, although coming down but to the second Roman war with Macedon (170 B.C.), was published in 1614. It is written throughout in admirable English; but the preface is the most interesting portion, for the subject itself is dreary, though lightened by glimpses of autobiography and occasional flashes of fire—scorching satire wrapped in ambiguous phrase. Its sale was suppressed in January 1615 as 'too saucy in censuring the acts of kings.' Oliver Cromwell, writing to his son Richard, in 1650, says, 'Recreate yourself with Sir Walter Raleigh's *History;* it is a body of history, and will add much more to your understanding than fragments of story.' The book was written for the young prince, and his death took from the author all heart to complete his work. Other writings of Raleigh's captivity were *The Prerogative of Parliament* (written 1615, published in 1628), which must have goaded the king still further; *The Cabinet Council*, published by John Milton in 1658; *A Discourse of War*, one of his most perfect pieces of writing; and *Observations on Trade and Commerce*, an appeal for free trade, suppressed like the rest.

On January 30, 1616, Raleigh was released from the Tower through the influence of Sir Ralph Winwood and Villiers, expressly to make preparations for an expedition to the Orinoco in search of a gold-mine which he maintained existed there. He engaged not to molest the dominions of the king of Spain, but he had been brought up on the old Elizabethan theory of no peace beyond the line, and doubtless he thought he had everything to gain and nothing to lose by a desperate venture, and that the gold he would bring home would gild over any formal breach of his promise. It seems difficult to understand how James can have expected that such an expedition could be made without a collision with Spain, and we find that he

was careful to give himself the cowardly safeguard of allowing Raleigh to go with his old sentence still hanging over his head, as well as communicating his route to Gondomar, the Spanish ambassador. And so in April 1617 the hero sailed to the doom which fate was weaving for him, while James even then was drawing into ever closer relations with Spain, and beginning his negotiations for the Spanish marriage. Before sailing Raleigh asked leave, but in vain, to make an attack on Genoa, an ally of Spain. His small fleet was manned, some forty gentlemen excepted, by 'the very scum of the world, drunkards, blasphemers.' Storms, desertion, disease, and death followed them from the first, and ere they reached the mouth of the river Raleigh was himself stricken down by sickness and compelled to stay behind with the ships, and entrust the command of the party who went to seek the mine to Keymis. He did not give his men distinct orders to avoid fighting with the Spaniards, and when they found in their way a new Spanish town, San Thomé, they attacked it and burned it down, but never reached the mine. In the fight young Walter Raleigh was struck down, as he shouted the words, 'Come on, my men! This is the only mine you will ever find.' Keymis lost control of his men, and came sadly back to his admiral, whose bitter reproaches made him drive a knife into his heart. The men now refused to return with Raleigh to the mine, whereupon he asked them if they would follow him in an attack on the Mexican fleet, telling them in his desperation that he had in his possession a commission from France. At length, on the 21st of June 1618, he arrived at Plymouth with his ship, the *Destiny*, alone and utterly cast down. His kinsman Sir Lewis [Judas] Stukely was sent to bring him up to London; at Salisbury on the way he feigned illness to gain four days' time to write his touching *Apology for the Voyage to Guiana*. Surrounded by a ring of spies, chiefest among whom was Stukely, he again intrigued for an escape to France, but was betrayed at every step. James dared not allow him to appear before the council of state, but had him formally examined before a commission of six, among them Coke, Archbishop Abbot, and Bacon, besides resorting to the infamy of sending a spy to gain his confidence and discover his secrets. In his perplexity Raleigh damaged his cause by contradictory statements and confessions, and his judges seem to have convinced themselves that he had never had any intention to find the mine at all, as appears from the *Declaration of the Demeanour and Carriage of Sir Walter Raleigh*, a feeble statement, though drawn up by the master-hand of Bacon. He was condemned to die the next morning (29th October 1618) on the old sentence, and neither the entreaties of the queen nor his own moving eloquence could save his life. 'You will come to-morrow morning,' he said to an old friend he met on his way back to prison; 'I do not know what you will do for a place. For my own part, I am sure of one.' One of his kinsmen warning him that his enemies would take exception at his high spirits, 'It is my last mirth in this world,' said he; 'do not grudge it to me. When I come to the sad parting, you shall see me grave enough.' His high courage never left him to the last. He wrote some verses the night before, and, says Dean Tounson, 'he ate his breakfast heartily, and took tobacco, and made no more of his death than if it had been to take a journey.' Of the cup of sack brought him he said, 'It is good drink, if a man might stay by it.' The speech he made on the scaffold was masterly in its persuasive eloquence—'as he stood there in the cold morning air,' says Mr Gosse, 'he foiled James and Philip at one thrust, and conquered the esteem of all posterity.' He asked to see the axe, and touched the edge with the words, 'This gives me no fear. It is a sharp and fair medicine to cure me of all my diseases.' To some one who objected that he ought to lay his head toward the east he answered, 'What matter how the head lie so the heart be right,' than which, as Mr Gardiner well says, no better epitaph could be found for Raleigh's tomb.

The best edition of Raleigh's works is that in 8 vols. published at Oxford in 1829, with the 18th-century Lives by Oldys and Birch prefixed. Sir Egerton Brydges edited the Poems in 1814. See Dr T. N. Brushfield's Bibliography (Plymouth, 1886). There are Lives by Cayley (1805), Tytler (1833), Mrs Thomson (1830), Edward Edwards (the fullest, vol. i., life; vol. ii., letters, 1868), J. A. St John (1868), Louise Creighton (1877), Edmund Gosse (1886), and William Stebbing (1892). Gibbon thought of treating the subject, but abandoned it. Kingsley's glowing essay in *Miscellanies* (vol. i. 1859) is excellent; so also, but in a different way, is the treatment in S. R. Gardiner's History (vols. i.–iii.).

Ralston, WILLIAM RALSTON SHEDDEN, Russian scholar and folklorist, was born in 1828 of Scotch ancestry—his surname originally Shedden. He studied at Trinity College, Cambridge (1846–50); was called to the bar at the Inner Temple in 1862, but never practised; and from 1853 to 1875 held a post in the library of the British Museum. He four times visited Russia; in 1886 was elected a corresponding member of the St Petersburg Imperial Society of Sciences; and besides many review and magazine articles, and a translation of his friend Turguenieff's *Liza* (1869), published *Krilоff and his Fables* (1869), *Songs of the Russian People* (1872), *Russian Folk-tales* (1873), and *Early Russian History* (1874), the last his Ilchester lectures at Oxford. He was also a splendid *raconteur*. He died in London, 6th August 1889.

Ram, an ironclad ship intended to run into and sink an enemy's vessels. For this purpose it is provided with a heavily armoured stem projecting below the water-line in the form of a beak (see figs. 7 &c. in article NAVY). In action the ram is propelled at full speed against her antagonist, and if she succeeds in striking her the blow is supposed to be sufficient to crush in her side and sink her immediately. Although at first rams had a separate rating in the British navy, all line-of-battle ships are now in effect rams, and the name is no longer used to denote a particular class of vessel, but is only applied to the part of the stem of the battle-ship used in striking. The ram was first employed during the American civil war in the action between the Federal fleet and the Confederate armour-clad ram *Virginia* in Norfolk Roads in 1862, when the Federal frigate *Cumberland* was rammed and sunk by the *Virginia*. In 1866 the Austrian ironclad *Ferdinand Max* rammed and sunk the Italian ironclad *Re d'Italia* at the battle of Lissa. In 1879 the Peruvian ironclad ram *Huascar* rammed and sunk the Chilian corvette *Esmeralda*. In 1875, while the Channel Fleet were off the Irish coast, the *Vanguard* was accidentally rammed by the *Iron Duke*, and sank in an hour. During the German naval manœuvres of 1878 the *Grosser Kurfürst* was rammed by the *König Wilhelm*, and sank immediately, 280 of her crew being drowned. In 1893 the *Victoria*, flagship of the Mediterranean squadron, was rammed by the *Camperdown* and sunk with Admiral Tryon and 400 men. The result of all engagements fought since the introduction of rams has shown that when an attacked vessel is under control and properly handled ramming can easily be avoided; but at the same time it now plays an important part in naval tactics.

Ráma is, in Hindu mythology, the name common to three incarnations of Vishnu, of Parasuráma, Rámachandra, and Balaráma. See VISHNU.

Ram'adan, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course, from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spittle, are strictly prohibited during that period. Even when obliged to take medicine the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence in all sorts of enjoyments. The fast of Ramadan, now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of midsummer. The sick, travellers, and soldiers in time of war are temporarily released from this duty, but they have to fast an equal number of days at a subsequent period when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious are expressly exempt from fasting. The principal passages treating of the fast of Ramadan are found in the second Surah of the Koran, called 'The Cow.'

Rámáyana is the name of one of the two great epic poems of ancient India (for the other, see the article MAHÁBHÁRATA). Its subject-matter is the history of Ráma (q.v.), and its reputed author is *Valmiki*, who is said to have taught his poem to the two sons of Ráma. But though this latter account is open to doubt, it seems certain that Valmíki was a real personage, and, moreover, that the Rámáyana was the work of one single poet—not, like the Mahábhárata, the creation of various epochs and different minds. As a poetical composition the Rámáyana is therefore far superior to the Mahábhárata; and it may be called the best great poem of ancient India. Whereas the character of the Mahábhárata is cyclopædic, its main subject-matter overgrown by episodes of the most diversified nature, the Rámáyana has but one object in view, the history of Ráma. Its episodes are rare, and restricted to the early portion of the work, and its poetical diction betrays throughout the same finish and the same poetical genius. Whether we apply as a test the aspect of the religious life, or the geographical and other knowledge displayed in the two works, the Rámáyana appears the older. Since it is the chief source whence our information of the Ráma incarnation of Vishnu is derived, its contents may be gathered from the article VISHNU. The Rámáyana contains professedly 24,000 epic verses, or *Slokas*, in seven books—some 48,000 lines of sixteen syllables. The text which has come down to us exhibits, in different sets of manuscripts, such considerable discrepancies that there are practically two recensions. The one is more concise in its diction, and has less tendency than the other to that kind of descriptive enlargement of facts and sentiments which characterises the later poetry of India; it often also exhibits grammatical forms and peculiarities of an archaic stamp, where the other studiously avoids that which must have appeared to its editors in the light of a grammatical difficulty. There can be little doubt that the former is the older and more genuine text.

A complete edition of the older text, with two commentaries, was published at Madras in 1856, at Calcutta in 1860, and at Bombay in 1861. Of the later version Gorresio edited the first six books without a commentary, but with an Italian translation in poetical prose (1843-58). A complete translation of the *Rámáyan of Valmíki* in English verse, by R. T. H. Griffith, appeared in 1870-75 in five large volumes. See Williams, *Indian Epic Poetry* (1863); and Weber, *Ueber das Rámáyana* (1870).

Rambouillet, CATHERINE DE VIVONNE, MARQUISE DE, one of the most accomplished and illustrious women of the 17th century, was born at Rome in 1588. Her father was Jean de Vivonne, afterwards Marquis of Pisani; her mother, Julia Savelli, belonged to an old Italian family, and through her mother was connected with the Florentine banking house of Strozzi. At twelve Catherine was married to Charles d'Angennes, son of the Marquis de Rambouillet, who succeeded to the family estates and title on the death of his father in 1611. From the very beginning she disliked alike the morals and manners of the French court, and she early determined to gather round herself a select circle of friends. At once virtuous, spirituelle, sympathetic, and appreciative, she gathered together in the famous Hôtel Rambouillet for a long series of years all the talent and wit of France, and in her salon met for the first time on an equal footing the aristocracies of rank and of *esprit*. For fifty years she received the wits, critics, scholars, and poets of Paris: Malherbe, Racan, Balzac, Voiture, Corneille, Ménage, Chapelain, Scarron, Saint-Evremond, Benserade, La Rochefoucauld. But half of the glory of the Hôtel belonged to the brilliant women who frequented it, among them Mademoiselle de Scudéry, the beautiful Duchesse de Chevreuse, the Marquise de Sablé, who inspired the *Maximes* of La Rochefoucauld, Mademoiselle de la Vergne, afterwards Madame de La Fayette, the inimitable Madame de Sévigné; but conspicuous beyond all by her splendid beauty and faultless grace, the idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde—the Duchesse de Longueville. As the centre of this group reigned the Marquise de Rambouillet—'la grande Marquise,' 'the divine Arthénice'—and her beautiful daughter Julie (the Parthénie of *Clélie*), after fourteen years of suing, wife of the Duke of Montausier, who presented her with the famous *Garland of Julia*, a collection of love-verses, illustrated with exquisite paintings on vellum.

The frequenters of the Hôtel were celebrated for the elegance of their manners and the refinement of their language; but the latter, on the lips of imitators, degenerated into extravagant affectation and palpable pedantry—a mark for the comic satire of Molière in *Les Précieuses Ridicules* and *Les Femmes Savantes*. It must be remembered that the title *Précieuse* originally meant 'distinguished' in its best sense, and that the ladies of the coterie a generation before had been proud to wear it. Madame de Rambouillet's good taste in everything was conspicuous, and she led the fashion also in the decoration of houses. Her famous 'Chambre bleue,' furnished with blue velvet relieved by gold and silver, with large windows from floor to ceiling, and her alcove with its *ruelle*—at first adopted merely to save her from the heat of the fire, which she could not bear—were imitated in many a great house in France. Her importance declined under Louis XIV., who distrusted clever women, but she survived till December 1665.

See the *Historiettes* of Tallemant des Réaux and the *Dictionnaire des Précieuses* of Somaize; Röderer's *Mémoire pour servir à l'Histoire de la Société polie en France pendant le Dix-septième Siècle* (1834); Victor Cousin's *Jeunesse de Mde. de Longueville, Mde. de Sablé, &c.*; Livet's *Precieux et Précieuses* (1859); Brunetière's *Nouvelles Études Critiques* (2d ed. 1886).

Rameau, Jean Philippe, a French musician, was born at Dijon, 25th September 1683. At eighteen he went to Milan, but soon returned to France, to Paris, Lille, and Clermont in Auvergne. Here he acted as organist to the cathedral, and wrote his *Traité de l'Harmonie* (1722). Removing to Paris, he published *Nouveau Système* (1726), *Génération Harmonique* (1737), and *Nouvelles Réflexions* (1752). In 1733, at the mature age of fifty, he produced his first opera, *Hippolyte et Aricie*, the libretto of which was written by the Abbé Pellegrin. It created a great sensation, and Rameau was forthwith elevated to the rank of a rival to Lully (see Opera). Rameau's best opera was *Castor et Pollux*, produced at the Académie Royale de Musique in 1737. Between 1733 and 1760 he composed twenty-one operas and ballets, as well as numerous harpsichord pieces. Louis XV. created for him the office of composer of chamber music, granted him letters of nobility, and named him a Chevalier de St Michel. Rameau died 12th September 1764. See A. Pougin's essay (Paris, 1876).—Rameau's nephew, well known as giving the title to a singular dialogue of Diderot's, which Goethe thought worthy of translation into German, had actual existence, being Louis Sébastien Mercier (1740–1814), author of the famous *Tableau de Paris*.

Ramée, De la. See Ramus, and Ouida.

Rameses, the name of several Egyptian monarchs, of whom two, the first and the second, were specially famous (see Egypt, Vol. IV. p. 240). It is usual to identify the warrior king Rameses II. with the Pharaoh of the oppression, and Rameses III. with the Pharaoh of the Exodus, though there is some difficulty in the identification. The mummy of Rameses II. was found at Deir-el-Bahari in 1881, that of Rameses III. at Boulak in 1886. The story of Rhampsinitus (q.v.) seems to refer to Rameses III. For the treasure-city called Rameses, see Pithom.

Ramie. See Bœhmeria.

Ramillies, a village of Brabant, Belgium, 14 miles by rail N. of Namur, is memorable as the place near which, on May 23, 1706, the French forces under Marshal Villeroy and the Elector of Bavaria were defeated by Marlborough, with the loss of almost all their cannon and baggage, and thirteen thousand killed and wounded. This victory compelled the French to give up the whole of the Spanish Netherlands.

Rammohun Roy. Rájá Rám Mohán Rái, founder of the Brahmo Somaj (q.v.), was born at Radhanagar in Bengal, in May 1772, his ancestors being Brahmans of high birth. He studied Persian, Arabic, and Sanskrit, and soon began to doubt the foundations of the ancestral faith. He spent some time studying Buddhism in Tibet, and gave offence there by his frank criticisms. He incurred the enmity of his family for his religious views, and lived at Benares till 1803. For some years he was revenue collector in Rangpur. In 1811 he succeeded to affluence on the death of his brother. He published various works in Persian, Arabic, and Sanskrit, the object of the whole being the uprooting of idolatry. His influence was powerful in securing the abolition of suttee. He also issued in English an abridgment of the *Vedanta*, giving a digest of the Vedas, the ancient sacred books of the Hindus. In 1820 he published *The Precepts of Jesus, the Guide to Peace and Happiness*, accepting the morality preached by Christ, but rejecting belief in His deity or in the miracles, and wrote other pamphlets hostile both to Hinduism and to Christian Trinitarianism. In 1828 he began the association which grew into the Brahmo Somaj, and in 1831 visited England, where he was received with all but universal friendliness and respect. He took a lively interest in the Reform agitation, and gave valuable evidence before the Board of Control on the condition of India, but overtasked himself, and died at Bristol, 27th September 1833.

See Miss Carpenter's *Last Days of Rammohun Roy* (1866). There is also a full Bengali memoir (1881); and his English works have been edited by Jogendra Chunder Ghose (2 vols. 1888).

Ramnagar, two towns of India: (1) a town of the North-western Provinces, stands on the right bank of the Ganges, 2 miles above Benares. It contains a palace, the residence of the rajah of Benares, which rises from the banks of the sacred stream by a number of fine ghâts or flights of stairs. There is a fort, and whips and wicker-work chairs are manufactured. Pop. 11,859.—(2) A town of the Punjab, on the Chenab River, 28 miles NW. of Gujranwala. It was a place of great importance in the 18th century, being then known as Rasulnagar, but was stormed by the Sikhs under Ranjit Singh in 1795, and its name changed to Ramnagar. It is now a place of only 6830 inhabitants, who make leathern vessels. A large fair is held here every April.

Rampart forms the substratum of every permanent fortification; see Fortification.

Ramphastidæ. See Toucan.

Rampion (*Campanula rapunculus*; see Campanula), a perennial plant, a native of Europe, rare in England, with a stem about two feet high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovato-lanceolate and waved. The root is white and spindle-shaped, and was formerly much used for the table, under the name of *Rampion* or *Ramps*. The plant is now little cultivated in Britain, but is still commonly grown in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

Rampion (*Campanula rapunculus*).

Rampur, the capital of a native state of India, in the North-western Provinces, stands on the river Kosila, 110 miles E. by N. of Delhi. It manufactures damask, pottery, sword-blades, and jewellery. Pop. (1891) 73,530.—The *state*, entirely surrounded by British territory, has an area of 899 (another authority says 945) sq. m. and a pop. of 541,914.

Rampur Bauleah, chief town of the Rajshahi district (area, 2361 sq. m.) of Bengal, stands on the north bank of the Ganges, is a centre of silk and indigo trade, and has an English Presbyterian mission; pop. 21,407.

Ramsay, Allan, Scottish poet, was born in the parish of Crawford, Lanarkshire, October 15, 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. At fourteen he was put apprentice to a wigmaker in Edinburgh, and followed that calling till his thirtieth year, by which time he had become known as a poet, having issued several short humorous satires and realistic descriptions, which were printed as broadsides, and sold in his shop or on the street for a penny each. He had also written (1716–18) two

additional cantos to the old Scots poem of *Christ's Kirk on the Green*, felicitous pictures of rustic life and broad humour. Ramsay now abandoned wig-making, and commenced business as a bookseller in the High Street, with a sign of Mercury over his door. Later he removed to the Luckenbooths, and there flourished under the heads of Drummond and Ben Jonson, adding to his business a circulating library—the first established in Scotland. Down to 1755, when he retired to a villa of his own erection, 'honest Allan's' career, worldly and literary, was eminently prosperous. Neither Puritan nor profligate, social in his instincts, yet careful and industrious, Ramsay never allowed his pride and vanity as a poet to withdraw him from business. One brief cloud overcast the poet's successful career. He built a theatre in Edinburgh at his own expense, which was almost immediately shut up by the magistrates, in virtue of the act passed in 1737 prohibiting all dramatic exhibitions without special license. Besides his loss he suffered much from the attacks of the churchmen of the day. His application to Lord Advocate Forbes for 'some canny post' was unsuccessful; yet his misfortunes had left him a decent competency, and he spent the last two or three years of his life in cheerful retirement in the quaint but picturesque octagonal house he had built on the north side of the Castle Hill, and here he died 7th January 1758. He had the gratification of seeing his only surviving son, Allan Ramsay (1713–84), fast rising into distinction as a portrait-painter; in 1767 he was appointed principal painter to the king. A complete edition of the elder Allan's poems with a biography was published by Chalmers (1800); a fine edition, with the music of the songs, and engravings by David Allan, in 1788. A good selection is that by J. Logie Robertson (1887). A monument to Ramsay by Steell was erected in Edinburgh in 1865.

The following are his principal works: *Tartana, or the Plaid* (1721); a collected edition of his *Poems*, published by subscription in 1721, by which it is said the poet realised 400 guineas; *Fables and Tales* (1722); *Fair Assembly* (1723); *Health, a Poem* (1724); *The Tea-table Miscellany*, a collection of the most choice songs, Scottish and English (1724), to which a second volume was published in 1725, a third in 1727, and a fourth in 1740; *The Evergreen*, 'being a collection of Scots Poems wrote by the Ingenious before 1600,' published in 1724; *The Gentle Shepherd, a Pastoral Comedy* (1725); a second collection of *Poems* (1728); *Thirty Fables* (1730). See the Life by Oliphant Smeaton ('Famous Scots,' 1896).

Ramsay, Edward Bannerman Burnett, Dean of Edinburgh, was born in Aberdeen, 31st January 1793, the grandson of Sir Thomas Burnett, Bart., of Leys. His father, Alexander Burnett, was sheriff of Kincardineshire. Edward was the fourth son, and when very young he was taken by his grand-uncle, Sir Alexander Ramsay, who sent him to school near his own house at Harlsey in Yorkshire. In 1806 Alexander Burnett succeeded to Sir Alexander's estates, assumed the surname of Ramsay, and soon after was created a baronet. Edward Burnett Ramsay took a poll degree at St John's College, Cambridge, in 1814, was ordained in 1816, and held a curacy in Somersetshire until 1824, when he removed to Edinburgh as curate of St George's. Two years later he was made incumbent of St Paul's, Carrubber's Close, but this he exchanged in 1827 for the curacy of St John's, of which Bishop Sandford was incumbent. On the bishop's death in 1830 Ramsay succeeded to the charge; and in 1846 he was appointed dean of the diocese, having already (1844) declined the bishopric of Fredericton, as he afterwards (1847 and 1862) did those of Glasgow and Edinburgh. In 1860 he received the degree of LL.D. from Edinburgh University. He died 27th December 1872. Ramsay did a very great service for the Scottish Episcopal Church by his work in connection with the Church Society, of which he was the first secretary and really the founder, and out of which grew the later Representative Church Council. But it is for the sake of his books—or rather of one of them—that his fame is secure.

Among his works, besides sermons, &c., are Memoirs of Sir J. E. Smith and Dr Chalmers, *Diversities of Christian Character* (1858), *Faults in Christian Believers* (1859), *Pulpit Table-talk* (1868), *The Christian Life* (1869), and a number of others. But the book with which his name will always be identified is the *Reminiscences of Scottish Life and Character*, which had its origin in two lectures ('On Recent Changes in Scottish Manners and Habits') delivered in Edinburgh in 1856–57, and published in a small octavo of 64 pp. in 1857; the third edition (1859), bearing the title of the *Reminiscences*, extended to 211 pages. A second series (pp. xxxviii., 221) appeared in 1861. See the Memoir, by Cosmo Innes, prefixed to the 22d ed. (1874).

Ramsbottom, a manufacturing town of Lancashire, on the Irwell, 4 miles N. of Bury. The first Sir Robert Peel established calico-printing here, and it now has manufactures of cottons, calicoes, ropes, machines, &c. Pop. (1861) 4134; (1881) 16,142; (1891) 16,726.

Ramsden, Jesse, a mathematical instrument-maker, was born at Salterhebble, near Halifax in Yorkshire, in 1735, and began life as a cloth-worker. About 1755 he moved to London, and shortly afterwards began to work as an engraver. His skill recommended him to the mathematical instrument-makers, the daughter of one of whom, Dollond, he married. Being of an inventive turn, he spent his best efforts in effecting improvements in the sextant, theodolite, equatorial, barometer, micrometer, mural quadrant, and the like. He so improved the sextant that its range of error was diminished from 5 minutes to 30 seconds. He made the theodolite for the ordnance survey of England. He devised the mural circle, and made the first for Palermo and Dublin. He spent several years over an instrument for graduating mathematical instruments (see Graduation), and published an account of it as *Description of an Engine for Dividing Mathematical Instruments* (1777). For this the Commissioners of Longitude awarded him £615. He was elected a Fellow of the Royal Society in 1786, and was voted the Copley medal in 1795. He died at Brighton on 5th November 1800. Descriptions of some of his improved instruments will be found in *Phil. Trans.* (1779 and 1783). See Life by Lalande in *Journal des Sçavans* (1788).

Ramsey, (1) a seaport and watering-place in the north of the Isle of Man, 14 miles NNE. of Douglas, and by rail (1879) 18 NE. of Peel. It stands on a spacious bay, with a good sandy beach and a background of wooded hills (1842 feet), and from the beauty of its surroundings and the salubrity of its climate has risen into a favourite resort of tourists and pleasure-seekers. It has two promenades, a park, salt-water lake, a pier 730 yards long, and steamboat communication with Liverpool, Fleetwood, Glasgow, Greenock, Whitehaven, and Douglas. Pop. (1851) 2701; (1871) 3861; (1881) 4025; (1891) 4803.—(2) A market-town of Huntingdonshire, 12 miles NNE. of Huntingdon. It has a branch-line (1863) and remains of a mitred Benedictine abbey (969). Pop. of parish (1851) 4645; (1891) 4684.

Ramsgate, a watering-place and seaport of Kent, in the south-east of the Isle of Thanet, 72 miles E. by S. of London, 4 SSE. of Margate, and 15 ENE. of Canterbury. From a small fishing-village it began to increase in importance during the 18th century through successful trade with 'Russia and the East country,' and through the

formation here (1750–95) of a harbour of refuge for the Downs. That harbour, 51 acres in extent, with a sea-entrance 250 feet wide, is enclosed on the east and west by two piers 670 and 520 yards long. The aspect of the place, which George Eliot calls 'a strip of London come out for an airing,' is familiar through Frith's 'Ramsgate Sands' (1854); among its special features are an obelisk marking the spot where George IV. in 1821 embarked for Hanover, an iron promenade pier (1881), the fine Granville Hotel, a beautiful Roman Catholic church by the Pugins, a Benedictine monastery, college, and convent, and a Jewish synagogue and college, erected by Sir Moses Montefiore, who, like the elder Pugin, was a resident. To the north is Broadstairs (q.v.), beloved of Dickens; and to the west Pegwell Bay, with Ebbsfleet, the landing-place of St Augustine, and also, traditionally, of Hengist and Horsa. Here, too, is Osengall Hill, with an early Saxon cemetery. Ramsgate was incorporated in 1884. Pop. (1851) 11,838; (1881) 22,683; (1891) 24,676. See James Simson's *Historic Thanet* (1891).

Ramus. PETRUS. Pierre de la Ramée, an illustrious French 'humanist,' was the son of a poor labourer, and was born at the village of Cuth, in Vermandois, in 1515. In his twelfth year he got a situation as servant to a rich scholar at the Collége de Navarre, and, by devoting the day to his master, obtained the night for study, and made rapid progress. The method of teaching philosophy then prevalent dissatisfied him, and he was led to place a higher value on 'reason' than on 'authority;' when taking his degree in his twenty-first year he even maintained the extravagant thesis that 'all that Aristotle had said was false.' Immediately after he began lectures on the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to reform. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Dialecticæ Partitiones*) appeared in 1543 it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by a royal edict, and his lectures for a time suspended. But Ramus had at this time two powerful friends, Cardinals Charles de Bourbon and Charles de Lorraine, through whose influence he was, in 1545, appointed principal of the Collége de Presles. In 1551 Cardinal Lorraine succeeded in instituting for him a chair of Eloquence and Philosophy at the Collége Royal. He mingled largely in the literary and scholastic disputes of the time, and ultimately embraced Protestantism. He had to flee from Paris; after 1568 he travelled in Germany and Switzerland; but on returning to France in 1571 he perished in the fatal massacre of St Bartholomew, 24th August 1572. It was believed that he was assassinated by the direct instigation of one of his most persistent enemies.

Ramus holds an honourable place in the list of intellectual reformers. His assault on scholasticism as a *method of thinking* is vigorous, and his exposure of its puerile and useless subtleties is thorough. His system of logic, by which his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but it really adds little to logical science. What strikes one most, however, in Ramus is his universal intellectual activity. He wrote treatises on arithmetic, geometry, and algebra which were text-books for a hundred years; he was among the earliest adherents of the Copernican system of astronomy; Latin, Greek, and French grammar, rhetoric, morals, and theology all engaged his pen, and he seldom handled a subject which he did not to some degree elucidate. His followers were a widespread, and for long a powerful body of thinkers and teachers; France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain had their *Ramists*.

See monographs by Waddington (Paris, 1855), Desmaze (1864), and Lobstein (Strasb. 1878).

Rana. See FROG.

Rancé. ARMAND DE (1626–1700), the founder of the Trappists (q.v.).

Ranching, the business of cattle-breeding as pursued on a large scale in the unsettled districts of the United States from the Mississippi to the Pacific coasts, and from the Bad Lands of the Upper Missouri to the Gulf of Mexico. The name is derived from the Spanish *rancho*, properly 'mess' or 'mess-room,' but used in Mexico also for a herdsman's hut, and finally for a grazing-farm, as distinguished from a *hacienda*, a plantation or cultivated farm. The speciality of ranching is that the cattle are raised and kept in a half-wild condition, with little or no house shelter provided and no artificial feeding. The life of the 'cowboys' and ranchmen, if no longer so wild and adventurous as it once was, is still sufficiently free, open, and exciting to have great charms for enterprising youths; and amongst rancheros are to be found not merely hereditary cattle-breeders and rough frontiersmen, but accomplished university-bred men, who in their scanty leisure cherish their Old-World tastes for literature and music. To these are added not a few men whose past history would hardly bear looking into—helping to provide the materials of a strangely mixed society.

Large fortunes were made in the wild old days, but the gradual settlement of the ranching country has seriously embarrassed the business of the ranchman. The old cattle-kings of the south often had ranges, under Spanish land-grants, extending over several hundred square miles, and would brand many thousand calves each year. Herds would be 'on the trail' for from two to four months, the cattle from Texas crossing Red River, and passing through Indian Territory and southern Kansas to the railway; but the gradual settlement of the country and the extension of railways render these long trails impracticable and needless. The great events of the ranchman's year are the 'round-up,' when stock is taken, the cattle are branded, and such full-grown cattle gathered into a herd as are suitable for market; and the departure of the herds for market or port—times of hard work and severe strain for all concerned. In the south there is but one annual round-up: on the more civilised ranges of Wyoming, the Dakotas, Colorado, and Montana there are two round-ups in the year—one early in spring, to brand the calves and ascertain the losses during winter, another in autumn, when the steers over three years old are separated from the main herd and sent for sale. Besides the branding of ownership there is a special 'road-branding' of cattle for identification 'on the trail.' The cattle in the south are still mainly the coarse, long-horned Texan breed; in the north-west the original long-horns have been crossed with fine-grade northern cattle, and produce larger and less wild animals and finer beef.

See Brinson, *The Beef Bonanza* (1880); Roosevelt, *Ranch Life and the Hunting Trail* (1889).

Rancidity, the partial decomposition of butter, oil, and fats. See PUTREFACTION.

Rand or RANDT, THE. See JOHANNESBURG.

Randall. JAMES RYDER, the author of 'Maryland, my Maryland,' was born in Baltimore, 1st

January 1839, taught for a while in a Louisiana college, and then turned to journalism. Shut out from the army by a delicate constitution, he still gave powerful aid to the southern cause by his lyrics. These include, besides 'Maryland' (1861; called forth by news of the passage of the first Massachusetts troops through the streets of Baltimore, and the consequent bloodshed), 'Stonewall Jackson,' 'There's Life in the Old Land Yet,' and others. Since 1866 he has edited a paper in Augusta, Georgia.

Randazzo, a town of Sicily, at the northern foot of Mount Etna, with some old Norman churches. Pop. 9908.

Randers, a town in Jutland, on the Randers-Fiorde, 20 miles from its mouth in the Cattegat. Pop. (1870) 11,354; (1890) 16,617.

Randolph, Edmund Jennings, an American statesman, was born at Williamsburg, Virginia, 10th August 1753, studied at William and Mary College, and was admitted to the bar. In 1776 he helped to frame the constitution of Virginia, and became the state's first attorney-general. In 1786–88 he was governor of Virginia, and in 1787 he was a member of the convention which framed the constitution of the United States. He was working hard at a codification of the state-laws of Virginia when, in 1789, he was appointed by Washington attorney-general of the United States. In 1794 he was made secretary of state, but after the president's signing of the Jay Treaty (1795) with England he resigned in order to be free to vindicate his own conduct. Meanwhile he was practically ruined by the responsibility which he had incurred, as part of the duties of his office, for certain funds provided for foreign service; and, though he returned to the bar, he had to assign his lands and slaves. He died 13th September 1813. See Moncure D. Conway, *Omitted Chapters of History, disclosed in the Life and Papers of Edmund Randolph* (1888).

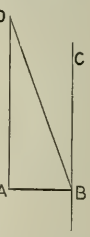
Randolph, John, 'of Roanoke,' was born at Cawsons, in Virginia, June 2, 1773. He was a second cousin of Edmund Randolph, and boasted the Indian princess Pocahontas among his ancestors. In 1799 he was elected to congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity, and for thirty years was more talked and written about than any American politician. Tall and meagre, peculiar in dress and manners, he was described as a strange mixture of the aristocrat and the Jacobin. He was the Democratic leader of the House of Representatives, but quarrelled with Jefferson, and opposed the war of 1812; he opposed also the Missouri Compromise, and stigmatised its northern supporters as 'Doughfaces;' and he sided against Jackson on the nullification question. From 1825 to 1827 he sat in the senate, and in 1830 he was appointed minister to Russia. By his will he manumitted his numerous slaves, and provided for their settlement in a free colony. He died in Philadelphia, June 24, 1833. See Lives by Garland (2 vols. 1850) and Henry Adams ('American Statesmen' series, 1882).

Randolph, Sir Thomas, a trusted agent of Queen Elizabeth, was born in 1523, lived abroad for safety's sake during Mary's reign, and after Elizabeth's accession was frequently employed in diplomatic missions to France, to Russia, and especially to Scotland. He was first sent thither in 1559, and at many a critical juncture for more than twenty years thereafter he played his mistress' cards in the perplexed and corrupt game of Scottish politics. He was twice shot at, in 1566 was ordered by Mary to leave the court, and in 1581 had to flee from Scotland for his life. He died in 1590.

Randolph, Thomas, poet and dramatist, belonged to a good Sussex family, but was born at his maternal grandfather's house in Northamptonshire in 1605. He was educated at Westminster and Trinity College, Cambridge, and died in March 1635. He left a number of poems and six plays: *Aristippus, or the Jovial Philosopher; The Conceited Peddler; The Jealous Lovers; The Muses' Looking-glass; Amyntas;* and *Hey for Honesty.* See W. C. Hazlitt's edition of his works (1875).

Ranelagh, a building erected in 1742 on the gardens of the last Earl of Ranelagh at Chelsea, had a rotunda 150 feet in diameter, with an orchestra in the centre and tiers of boxes all round. The chief amusement, promenading round and round the area below and taking refreshments in the boxes, the orchestra performing meanwhile, is often alluded to by Smollett, Johnson, and Walpole. Its older rival, Vauxhall (q.v.), survived it, for it was closed in 1803, and built upon the next year. Its site is now part of the Chelsea Hospital garden.—The name of Ranelagh, North and South, is given to two southern suburbs of Dublin.

Range-finders (see Cannon, Gunnery) are used for finding the range or distance of an enemy in the field, that in use in the British army being the Watkin Range-finder, introduced in 1882. It is contained in a rectangular box about $6\frac{3}{4} \times 2\frac{3}{4} \times 1\frac{1}{2}$ inches, and is based on the principle of the sextant, but so constructed that, while the near object is seen by reflection in a mirror, the distant object is seen by direct vision, and it can be used either with or without telescopes at its two eyeholes. Its use may be briefly described as follows: Let O be the object to be observed; a base line AB of known length, from 60 to 120 yards, is taken which is at right angles to AO as seen through the instrument at A. Another point on BC is found which is also at right angles to AB. When the instrument at B is set to observe O the angle CBO is obtained, and this being equal to the angle AOB, the distance between OA can be calculated. To save calculation, however, when the instrument is properly set for the length of base and the angle CBO the distance can be read off at once, the whole operation not taking longer than $2\frac{1}{4}$ minutes, and the error should be less than 1 per cent. of the range. All the officers and certain non-commissioned officers in every regiment are trained in the use of the instrument.



Rangoon, the capital of Lower Burma, stands on the Hlaing or Rangoon River, about 20 miles from its entrance into the Gulf of Martaban. The existing city is almost entirely of modern construction, built since the British took possession of the place in 1852. The town extends along the left bank of the Hlaing, the docks being on the other side of the river. Behind the town is the large military cantonment, grouped round the fortified hill (166 feet) on which stands the Shway-Dagôn pagoda, 'the most venerated object of worship in all the Indo-Chinese countries.' It is built of brick, is lavishly gilded, and tapers up to a cone 321 feet above the ground (see illustration under Burma). There is an excellent water-supply, the thoroughfares are traversed by tramway cars, and there has been an elective municipality since 1883. The principal buildings are the public and governmental offices, the Anglican cathedral (whose foundation-stone was laid by Lord Dufferin in 1886) and the other European churches, the native pagodas, a lunatic asylum, the chief gaol of Lower

Burma, the Phayre Museum in the horticultural gardens, St John's College, the high school, a hospital, &c. Along the river-side are numerous rice-husking-mills and sawmills. Pop. (1852) 25,000; (1872) 89,897; (1881) 134,176; (1891) 181,210. A little less than one-half are Burmese, and the natives of India are nearly as many. Rangoon is the principal port in all Burma, about 86 per cent. of the total trade of that country passing in and out at this port. Its trade has grown at a wonderfully rapid rate since the British took possession of Lower Burma. In 1852 the port was entered by not more than 125 small vessels, and even in 1859 the total imports and exports together had only risen to £2,131,000. By 1878 the statistics of the port stood at 559,000 tonnage of vessels entering; value of imports £3,777,700, and of exports £4,414,300. Since 1890 the port is entered by about 1000 vessels annually of some 1,000,000 tons burden; the total imports (excluding coasting trade) are valued at about £5,000,000 a year, and the total exports at £9,000,000. The chief exports are rice, teak, india-rubber, raw cotton, and other articles mentioned in the article BURMA. Since the incorporation of Burma with British India, Rangoon ranks as fourth of the commercial cities of the Indian Empire. A town has existed on the site of Rangoon since the 6th century B.C. It was always called Dagon down to the capture of the place by the Burmese sovereign Alompra towards the end of the 18th century. That prince rebuilt the place and called it Rangoon. It was taken by the British in 1825, and held until 1827; they captured it again in 1852, and have kept possession of it ever since.

Rangpur, a town of Bengal, on the Ghaghat, an arm of the Brahmaputra, and 110 miles SE. of Darjiling. It is the capital of a district in a great well-watered, fertile, well-tilled plain of sandy loam. Pop. 14,500.

Ranjit Singh, the founder of the Sikh kingdom in the Punjab of India, was born at Gujranwala on 2d November 1780, the son of a Sikh chief. His father died when he was twelve and his mother when he was seventeen years old. He at once began to show his ambition and capability for rule, and after the shah of Afghanistan had given him the province of Lahore he directed all his energies to the founding of a kingdom which should unite all the Sikh provinces under his own personal rule (see SIKHS). He died on 27th June 1839. He procured from an Afghan prince, as the price of his assistance in war, the famous Koh-i-nur diamond (see DIAMOND). See Sir L. Griffin, *Ranjit Singh* (Oxford, 1892).

Rank in the military forces of the British empire is not confined to the commissioned classes; the various grades of non-commissioned officers, and even the titles gunner, driver, sapper, or private are officially styled ranks. *Lance* or *acting* rank is a temporary advancement. Thus, a private or sapper is first made a lance-corporal, and a gunner or driver an acting-bombardier, before being permanently promoted. Until so promoted they rank only as private soldiers. Similarly a lance-sergeant is a corporal acting as sergeant, and holds only the lower rank.

Officers of the army and royal marines may hold either regimental or army rank or both. Up to captain inclusive, rank is purely regimental. Afterwards a captain may be promoted in his regiment to the successive ranks of major and lieutenant-colonel, or while still remaining a captain in his regiment he may become a major or lieutenant-colonel in the army by Brevet (q.v.). The rank of colonel is purely an army rank, obtainable only by brevet or on receiving an appointment, such as assistant-adjutant-general, which carries that rank. The several grades of General (q.v.) are also army ranks only. *Local rank* is sometimes conferred on an officer to enable him to exercise command over others senior to him in a certain locality (South Africa, Egypt, &c.). *Temporary rank* is often similarly granted, and some appointments carry such rank; for instance, a colonel appointed quartermaster-general in India becomes a temporary major-general while so employed, and reverts to the lower rank at the end of his five years' term of office unless promoted in the meantime. *Honorary rank* is held by officers of the ordnance-store and army-pay departments and by Quartermasters (q.v.) and riding-masters. Officers of the militia, yeomanry, and volunteers also, after a certain number of years' service, receive a step of honorary rank. *Substantive rank* includes all rank other than army, brevet, honorary, local, and temporary rank, held by officers unless they are on the unemployed half-pay list. *Half-pay rank* as lieutenant-colonel (£200 a year) may be taken by an officer after seven years' service as major. *Relative rank* is held by army chaplains and veterinary surgeons. It carries with it all precedence and advantages attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants and horses, rations of fuel and light (or allowances in their stead), detention and prize-money. It does not entitle the holder to salutes from ships or fortresses, nor to the turning out of guards, and, of course, it does not confer any right to command. The *corresponding ranks* in the army and navy are shown in the following table, where the asterisks denote 'according to date of commission,' and the dagger 'junior of the rank.'

Ranke, LEOPOLD VON, the greatest of German historians, was born on 21st December 1795, at Wiehe, about half-way between Gotha and Halle. Although he studied theology and philology at Halle and Berlin, and in 1818 began to teach at the gymnasium of Frankfort-on-Oder, his chiefest thoughts were given to the study of history, to which they were directed principally by his Luther studies and the reading of Scott's romances. The two works, *Geschichte der romanischen und germanischen Völker von 1494 bis 1535* (1824) and *Zur Kritik neuerer Geschichtschreiber* (1824), procured him a call to Berlin as professor of History in 1825. The latter of these works, and *Analecta* to his subsequent books, expound his views of the functions of history, and the methods of the ideal historian. History is the record of *facts*. It should know nothing of the political party, or church politics, or subjective views of the writer. It should be based upon sound documentary evidence, critically examined and sifted. In 1827 he was sent by the Prussian government to consult the archives of Vienna, Venice, Rome, and Florence; four years he spent in this work, and returned with a mass of the most valuable historical materials. The results of his labours were seen in *Fürsten und Völker von Süd-Europa im 16 und 17 Jahrhundert* (1827) and other books dealing with Servia, Turkey, and Venice; and *Die römischen Päpste im 16 und 17 Jahrhundert* (1834–37; 9th ed.

1889), perhaps the most finished of his books, certainly one of his great masterpieces of historical writing. Then he turned his attention to central and northern Europe, and wrote in quick succession *Deutsche Geschichte im Zeitalter der Reformation* (1839–47); *Zwölf Bücher preussischer Geschichte* (1847–48; new ed. 1871–74); *Französische Geschichte* (1852–61); *Englische Geschichte* (1859–67; 4th ed. 9 vols. 1877–79), the last two treating chiefly of the same two centuries as the books on south Europe; and *Zur deutschen Geschichte, vom Religionsfrieden bis zum Dreissigjährigen Krieg* (1869). Later periods and special periods of German history are treated of in books on the Origin of the Seven Years' War (2d ed. 1874), the German Powers and the Confederation (1871), *Zur Geschichte von Oesterreich und Preussen zwischen den Friedensschlüssen zu Aachen und Hubertsburg* (1876); the history of Germany and France in the 19th century (1887), and monographs on Wallenstein (1869), Hardenberg (5 vols. 1877–78), and Frederick the Great and Frederick William IV. (1878). To the above must be added a book on the revolutionary wars of 1791 and 1792 (1875), another on Venetian History (1878), and *Die Weltgeschichte*, of whose nine volumes (1881–88) he lived to see only seven published. This last work, which is the copestone of Ranke's historical labours, was begun when he was an old man of eighty-two; yet at that great age he kept two schooled historical assistants busy, studied critically the Greek and other sources, dictated and worked eight to ten hours a day, and published one volume a year regularly, until he died, on 23d May 1886, having rested from his beloved work only a few short days. Even his long life—he was over ninety when he died—would hardly have sufficed for the thorough works he accomplished had he not been a man of unwearied industry, with a marvellous memory, and a swift and intuitive judgment as to the value of historical material. His style is not brilliant, yet sufficiently clear and interesting. He always wrote from the standpoint of one who had the whole history of the world before his mind's eye. This and his skill in the portraiture of historical personages often lend the deepest interest to his narratives. His point of view was, however, that of the statesman; and he fails to give due prominence to the social and popular sides of national development. Ranke married an Irish lady in 1843, and was ennobled in 1865. He continued to lecture until 1872. His lectures exercised a great influence upon those who sat at his feet to learn, as is seen in the works of the great school of historical writers, Waitz, Von Sybel, Giesebrecht, and others. A collected edition of his *Werke* was published at Leipzig in 47 vols. in 1868; several of them have been translated into English.

See his autobiographical *Zur eigenen Lebensgeschichte* (ed. by A. Dove, 1890) and monographs by Winckler (1885) and Von Giesebrecht (1887).

Rankine, William John Macquorn, was born of good Ayrshire family at Edinburgh in 1820, and had his education at the university there. He learned engineering under Sir J. Macneill, and was appointed in 1855 to the chair at Glasgow. He died 24th December 1872. Rankine was an incessant worker, and his books on *Civil Engineering*, *The Steam-engine and other Prime Movers*, *Machinery and Millwork*, *Shipbuilding: Theoretical and Practical*, and *Applied Mechanics* were quickly accepted everywhere as standard text-books; and no modern work in the region of mathematical physics has higher value than his contributions to the new science of Thermodynamics, and to the theories of Elasticity and of Waves. His more important papers were collected, with a Life by Professor Tait (1881). Another side of his nature was seen in his capital humorous and patriotic songs, collected as *Songs and Fables* (1874).

Rannoch, a bleak, desolate moorland of northwest Perthshire, with a mean elevation of 1000 feet above sea-level, and measuring 28 miles by 15. Its surface is mostly a broad, silent, featureless tract of bog, heath, and moss, girdled by dark, distant mountains. In its western part is Loch Lydoch ($5\frac{1}{4}$ miles × $\frac{1}{2}$ mile; 924 feet above sea-level), which winds amid flat and dismal scenery. Stretching eastward from the moor is Loch Rannoch ($9\frac{3}{8}$ miles × $1\frac{1}{8}$ mile; 668 feet), which is overhung by Schiehallion, contains a crannog with a later fortress, and sends off the Tummel 29 miles eastward and south-south-eastward to the Tay. Loch Tummel ($2\frac{3}{4}$ miles × $\frac{1}{2}$ mile; 480 feet) is an expansion of this river, on which are also the Falls of Tummel, 20 feet high.

Ransom—corrupted from the Latin *redemptio*—is the price paid by a prisoner-of-war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors, but those for princes or great nobles to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I. for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and King John of France for £500,000, payable in instalments. After the battles of St Quentin and Gravelines, in the war between France and Philip of Spain, the ransoms due by French prisoners to the Prince of Orange, Counts Egmont and Horn, and a few other superior commanders were estimated at 2 million crowns; the Duc de Longueville paid Count Horn 80,000 crowns as his ransom.—In modern warfare, where the fighting is performed by professional soldiers, pecuniary ransoms are never resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

Ranters. See Methodists.

Ranunculaceæ, a natural order of exogenous plants, mostly herbaceous, rarely shrubs, and generally natives of cold, damp climates. Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species exceeds 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated sheathing stalks. The calyx is of 3–6 deciduous hypogynous sepals; the corolla of 3–15 hypogynous petals, in one or more rows, sometimes assuming very remarkable forms, as in larkspur, aconite, and columbine; rarely absent, in which case the sepals are gaily coloured. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil; the ovary with one or more ovules. The fruit either consists of dry achenia, or is berry-like or follicular. Acridity is the prevailing character of the order,

and the leaves of some species readily produce blisters; but this property disappears when they are dried or heated. Many are narcotic and poisonous; some are used in medicine, as aconite and hellebore. The seeds of *Nigella sativa* were formerly used instead of pepper. The fruit of the May Apple or Wild Lemon (*Podophyllum peltatum*) of North America may be eaten, but is very acid. Many of the order produce flowers of great beauty, as some species of Ranunculus (q.v.), Anemone (q.v.), Larkspur (q.v.), Peony (q.v.), Columbine (q.v.), Clematis (q.v.), &c.

Ranunculus, a genus of plants of the natural order Ranunculaceæ; having five sepals; five petals, with a nectariferous pore at the base of each petal, often covered with a scale; many stamens situated on a receptacle, and ovaries accumulated into a head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers, familiarly known as *Buttercups;* others, known by

Ranunculus asiaticus, garden varieties.

the name of *Crowfoot,* are troublesome weeds in gardens and pastures. Many, as the Spearworts, are found chiefly in moist places, and some are altogether aquatic, covering the surface of ditches, ponds, and rivers, where the water is shallow, with a carpet of verdure exquisitely studded with beautiful white flowers. One species, the Asiatic Ranunculus, or Garden Ranunculus, exclusively the ranunculus of florists, a native of the Levant, has been cultivated in Europe for almost 300 years. The cultivated varieties are extremely numerous, brilliantly coloured, and very symmetrical in form. The ranunculus is propagated by seed, by offset tubers, or by dividing the clusters of tubers. The roots are often taken up in summer, after the leaves die, and kept in a dry place till the beginning of the ensuing winter or spring. The ranunculus loves a free and rich soil. Double-flowered varieties of some other species, with taller stems and smaller white or yellow flowers, are cultivated in flower-gardens, sometimes under the name of *Bachelors' Buttons.* The acridity of many species of ranunculus is such that the leaves, bruised and applied to the skin, produce blisters; and those of *R. sceleratus,* a pretty common British species, are said to be used by beggars to cause sores, in order to move compassion. *R. Thora,* a Swiss species, is of extreme acridity, and hunters were accustomed in former times to poison darts and arrows with its juice. Water distilled from the leaves of *R. flammula,* a British species, with rather tall stem and ovato-lanceolate leaves, common by the sides of ditches, &c., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning. Yet the leaves of *R. ficaria*—sometimes called *Pilewort* and *Lesser Celandine,* a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pastures in which *R. acris, R. repens,* &c. are very abundant are injured by them, and they ought to be diligently grubbed out; they are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage is even advantageous, and that they may act as a condiment. Their acridity is lost in drying, and they are not injurious to hay. The small tubers of Pilewort, or Lesser Celandine, are used for the cure of hæmorrhoids; but their acridity also disappears when they are boiled, and they are then a pleasant article of food. *R. aquatilis,* a British species, very abundant in streams in many parts of Britain, is eaten with avidity by cattle, the acridity so general in the other species being wanting in it.

Ranz des Vaches (in German, *Kuhreigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on the Alphorn or Kuh-horn (q.v.). The associations of pastoral life recalled by these airs to the Swiss in foreign countries have been said to produce an almost irresistible longing for home, or *nostalgia.*

Rap (contracted from *rapparee,* 'an Irish plunderer'), familiar in the phrase 'not a rap,' was a counterfeit Irish coin of the time of George I., which passed for a halfpenny, though not really worth a fourth of that value. There was also a small Swiss coin called *rappen,* worth a centime.

Rapallo, a winter health-resort of Northern Italy, 17 miles by rail ESE. of Genoa, with a castle and the pilgrimage church of the Madonna (1557) on the Monte Allegro. Off here the Venetian fleet defeated the Genoese in 1431. Pop. 2625.

Rape, or Coleseed (*Brassica napus;* see Brassica), an annual plant much cultivated on account both of its herbage and of its oil-producing seeds. It is a native of Europe and perhaps of England; but it is hard to say where it is truly indigenous and where naturalised. It is so nearly allied to *Brassica rapa* (Turnip), *B. campestris* (Swedish Turnip, Colza, &c.), *B. oleracea* (Kale, Cabbage, &c.), and *B. præcox* (Summer Rape) that botanical distinction is difficult, particularly as to some of the cultivated varieties. The root of rape is slender, or in cultivation sometimes becomes carrot-shaped (see Navew), but it never becomes turnip-shaped. The cultivation of rape is very general in many parts of the continent of Europe, from which it seems to have been introduced into England at least as early as the 16th century; and in the 17th

Rape (*Brassica napus*): *a,* silique.

century, if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the Continent it is not unusual to sow rape in order to *green-manuring*, ploughing its herbage into the soil, a mode of enriching land much more common in some parts of Europe than it is in Britain. Rape delights in a rich alluvial soil, and is particularly suitable for newly-reclaimed bogs and fens, in which the turnip does not succeed well; and it is also extensively cultivated in the chalk and oolite districts of the south of England. When cultivated for green-manuring rape is usually sown broadcast, but when intended to produce seed it is generally sown in drills, and receives manure and culture the same as the turnip. In rich soils rape sometimes attains a height of three or even four feet, so that the sheep turned in are hidden beneath the leaves, and seem to eat their way into the field. They eat the stalks even more greedily than the leaves. A too exclusive feeding on rape is, however, apt to produce diseases, which a sprinkling of salt, a supply of hay, &c. are found useful in preventing. When the seed is ripe rape is cut with the sickle; and, after a short time allowed for drying, the seed is thrashed out, when the haulm is often burned, a wasteful practice, as its decay affords more abundant and useful manure, and indeed cattle are fond of it as food. *Rape-cake*, the mass of seeds from which oil has been obtained by crushing, is used for feeding oxen and sheep, but is very inferior to linseed-cake and some other kinds of oil-cake. Ground into dust, it is a very valuable manure. *Rape-oil* is extensively used for machinery and for lamps; but the oil and cake so called are not exclusively obtained from this plant, nor are the names *Colza-oil* and *Rape-oil* used to discriminate the produce of different plants, although in some parts of Europe the name Colza is given to varieties of *Brassica campestris* and *B. oleracea*, which are cultivated in the same way as rape. *B. præcox* is also cultivated in some places, being sown in spring and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names (see OILS, OIL-CAKE).—The name *Rape* is from Lat. *rapa*, 'a turnip;' *Colza* is through the French from the Dutch *koolzaad*, 'cole-seed.'

Rape is having carnal knowledge of a woman without her conscious consent, and such consent must not be extorted by violence or threats of violence. The Criminal Law Amendment Act, 1885, provides that a man is guilty of rape if by personating a woman's husband he succeeds in having connection with her. Previously the point was doubtful. A husband cannot under any circumstances commit rape on his own wife, her consent at marriage being irrevocable; but Mr Justice Stephen is of opinion that under certain circumstances he may be convicted at least of an indecent assault. Nor can a boy under fourteen be guilty of this crime, for in law (whatever be the physical fact) he is absolutely presumed incapable; but both husband and boy may be charged with assisting others in committing it. Rape is a felony punishable with penal servitude for life. To this every one who unlawfully and carnally knows any girl under the age of thirteen years is also liable. The attempt to have unlawful carnal knowledge of any girl under thirteen, and the act or attempt in the case of a girl between thirteen and sixteen (save when the accused reasonably believes her to be over sixteen), or in the case of any female idiot 'under circumstances which do not amount to rape,' are misdemeanours, punishable by two years' imprisonment with hard labour. The merest penetration suffices to constitute the crime. As regards evidence in cases of this sort, the most important question will usually be, How far is the supposed injured person to be believed? That depends on many things, of which the chief are (1) her character —for though as a matter of law rape may be committed on a prostitute, since even she cannot be compelled to submit to outrage, yet in fact if the chief witness is shown to be unchaste the charge almost invariably breaks down; (2) the time within which and the person to whom she made the first complaint; (3) any marks of violence on her dress or person, and her agitated or calm demeanour; (4) the scene of the alleged crime, and the probability of strennous resistance attracting public notice; (5) whether the prisoner fled or not; (6) any marks of violence on his dress or person. (7) If apprehended soon after the alleged act the accused is usually asked to submit to medical examination. Refusal to do so is a strong presumption of at least intercourse. The thing to be guarded against is either a false charge made by a woman to extort money or, on failure of this attempt, persisted in from spiteful motives, or an accusation made by one who after consenting resists too late, or who tries when by any accident the fact of connection becomes known to whitewash her character.

The law which protects women against the class of crime of which rape is the chief has been made much wider of late years, chiefly by the Criminal Law Amendment Act of 1885, which contains provision against various kinds of procuration. As regards the abduction (1) of a woman on account of her fortune; (2) by force with intent to marry; (3) of an unmarried girl under the age of eighteen with intent to have carnal knowledge of her, it need only be remarked that the first two are felonies punishable by fourteen years' penal servitude, and the third a misdemeanour punishable by two years' imprisonment with hard labour.

In the United States the crime is everywhere treated as a felony, and punished with imprisonment for life or for a number of years; but the punishment is somewhat different in the different states of the Union. See also ABDUCTION.

Raphael Santi, born at Urbino in 1483, died at Rome 1520, was the son and pupil of Giovanni Santi, a painter, whose death took place in 1494. Apprenticed about 1495 at Perugia, Raphael learned his profession from Perugino, and became such a clever imitator of his style that to this day the early pictures of the disciple are confounded with those of his teacher. Raphael, in fact, copied Perugino's drawings (Academy of Venice), helped to work at Perugino's pictures, and finished altar-pieces from Perugino's designs. Examples are the Resurrection of the Vatican and the Virgin and Child, with and without attendant saints, at Berlin. The presence of Raphael during these years at Perugia, Urbino, and Città di Castello may be traced by his sketches at each of these places. His first patrons were the Duke and princesses of Urbino, ecclesiastical corporations at Città di Castello, and ladies of the high families of Baglione and Oddi at Perugia. His earliest commissions were those of Città di Castello, where (1502–3) the most important of his early works, the Crucifixion in the Dudley collection, was painted. An Assumption of the Virgin, now at the Vatican, was executed shortly after for Maddalena degli Oddi. Distinct features in these pieces are dependence as to form on Perugino and Pinturicchio, combined with a feeling for grace and pure colour essentially original. In a Marriage of the Virgin of 1504 (Milan gallery), these qualities are found in conjunction with exact repetitions of Perugino's figures. It is probable that about 1504 Raphael began to discern the

advantage of greater independence. His predellas of the Vatican Coronation, and especially the Epiphany of that series, already display some acquaintance with the more advanced methods of the Florentines. Yet for some time longer the paramount influence of Perugino remained manifest, and Raphael showed Peruginesque influence in such pictures as the Connestabile Madonna, now at St Petersburg, the Vision of the Knight in the National Gallery, the little St Michael and St George, or the Marsyas of the Louvre, and the Graces belonging to the Duc d'Aumale at Chantilly. The painting of the Graces is obviously connected with a journey which Raphael made to Sienna in 1505, when he gave assistance to Pinturicchio in drafting the preliminary design for frescoes in the Piccolomini library. It was there that he copied the Graces, of which the sketch is preserved at the Venice Academy. At Sienna Raphael probably heard of the competition between Leonardo and Michaelangelo, who were rivals in 1505 for the decoration of the town-hall of Florence, and there is good cause for thinking that he accompanied Perugino to that capital to be near the lists of this artistic tournament. But before starting he probably took commissions, which gave as a final result the Virgin, Child, and Saints, in full length, called the Madonna Ansidei, now at the National Gallery, and the Virgin and Child with four saints, called the Madonna of Sant' Antonio, belonging to the Ripalda family, both of which were delivered at Perugia. The Madonna of Terranuova, a group of half-lengths at the Berlin Museum, was completed at Florence. Raphael was now on the path which Perugino had trod before him, had a painting-room at Florence and a painting-room at Perugia, but was not satisfied as his master had been with that finality which caused Perugino to remain stationary in the rut of an old style. He determined to acquire and assimilate some of the boldness of Michaelangelo, and the principles which Leonardo had been teaching to the students of his academy at Milan. When, after a short absence at Florence, he resumed work on the Ansidei and Sant' Antonio Madonnas at Perugia, Raphael gave as much as he could of the new spirit which was in him to those compositions, without being able to alter their archaic character. In the second of these pictures some heads, recast in a new mould, reveal the influence of Da Vinci; for it is characteristic of Raphael that, after witnessing the struggle of that master with Michaelangelo, he came for a time to the conclusion that Leonardo was the better man so far as grace and expression were in question, though for action the spirit of Michaelangelo might be preferable. The Terranuova Madonna shows the struggle in which Raphael was engaged. It has the brightness and sweetness of the Umbrian with the breadth of execution of the Florentine. But similar characteristics distinguish the five small predellas which once formed part of the Madonna of Sant' Antonio, whilst the 'Sermon on the Mount,' in Lord Lansdowne's collection at Bowood, and part of the predella of the Ansidei Madonna, display the influence of the works of Masaccio, Filippino, and Ghirlandajo.

It is not historically proved that Raphael and Da Vinci were intimate, but all the pictures which left Raphael's easel at Florence in 1505-6 recall Leonardo in expression, concentration of lines and light, tempered atmosphere, and subtle combinations of movement and tints. Examples are Madonnas and Holy Families, of which the most conspicuous are that of the Gran Duca, the small Cowper, the Cardellino, and Casa Tempi, at Florence, and the Virgin in Green at Vienna. But in portrait more than elsewhere the lessons of Da Vinci are visible, and the likeness of Maddalena Doni at Florence is inspired by the Mona Lisa of the Louvre. Of special interest to Englishmen as a creation of this time is the St George, which was sent by the Duke of Urbino to Henry VII. of England, in return for the garter given by that prince to Guidubaldo of Montefeltro. Attractions in other ways are the painter's own likeness at the Uffizi, in which we discern that the grace of his art was also displayed in Raphael's person, the Madonnas of Orleans, of the Palm, of St Petersburg, and Canigiani, in which Raphael finally appears as a pure Tuscan familiar with the arts of all his Florentine contemporaries.

The Entombment to which Raphael now turned his attention was finished for Atalanta Baglioni, and recalls in many ways the misfortunes which attended the worthless family of that name, which had so long governed Perugia. The sketches for the picture contain incidents that remind us of a massacre in which Atalanta lost her son. The picture in the Borghese palace is an embodiment of all the new principles which Raphael acquired at Florence, realising the perfect drawing of Da Vinci and the sculptural shape of Michaelangelo, allied to Peruginesque softness, and colour such as only Raphael could give. The result is perhaps a little stiffness, which is happily avoided in a graceful predella representing Hope, Faith, and Charity. As this fine work advanced to completion Raphael became very evidently attracted by the style of Fra Bartolommeo; and, under the influence of that master of monumental painting, he brought in part to perfection the Apostles attendant on the Eternal, in a fresco at San Severo of Perugia, whilst he composed and finished the Madonna del Baldacchino at Florence. During the progress of these works Raphael got into a large practice at Florence, where he reigned supreme in the absence of Perugino, Leonardo, and Michael Angelo. Some of the best work of his Florentine period was now produced—the small Holy Family with the Lamb at Madrid, much in the spirit of Da Vinci; the St Catharine of the Louvre; the Bridgewater and Colonna Madonnas; the Virgin and Sleeping Infant of Milan; the large Cowper Madonna; the Bella Giardiniera, and the Esterhazy Madonna.

From the days of Giotto and Masaccio to those of Raphael Rome had always attracted to its centre painters and sculptors of acknowledged skill in other cities of Italy. Michaelangelo had left Florence for the Vatican, and Raphael in 1508 did the same at the instigation of his relative Bramante, who was in great favour with Julius II., and not without support from Michaelangelo. The plans of this pope were gigantic. He laid the foundation of the new cathedral of St Peter because old St Peter's was tottering to its fall, and he caused the papal chambers to be decorated afresh because he disliked the frescoes of the old masters at that time covering their walls. He employed Raphael because Perugino, Sodoma, and others had failed to satisfy his taste. The date of Raphael's engagement to paint the 'Camere' of the Vatican is now fixed with certainty as 1509. In the ceiling of the chamber 'of the Signature' the space is divided into fields, in which the Temptation, the Judgment of Solomon, the Creation of the Planets, and Marsyas and Apollo were inserted side by side with medallions enclosing allegories of Theology, Philosophy, Justice, and Poetry. All these pictures exhibit an expanded style, in which the spirit of Perugino, quickened by the subtler spirit of Leonardo and Fra Bartolommeo, becomes associated with the antique. Never before had the artist had such an opportunity of study as now. When at Rome he was enabled to visit the treasures of old sculpture and

gems at the Vatican, and the collections of the cardinals Rovere and Medici. On the walls of the camera Raphael began the Disputa, in which he represented the Eternal, Christ, Mary, and the apostles and angels presiding in heaven over the sages of the Trinitarian controversy. Here Raphael practically entered on a method of painting with which he had not been very familiar; but he gained confidence as he proceeded, and, gradually descending from the higher parts to the lower, he equally applied the models and precepts of Leonardo and Fra Bartolommeo, became bolder and more energetic in the conception and rendering of form, and nearly succeeded in equalling the power of Michael-angelo himself. It was a happy time during which the youthful master laboured at this composition, the time when he longed to add to the art which he knew so well that of poetry, in which Michael-angelo excelled. His sketches for the Disputa are filled with snatches of sonnets, which, as he soon saw, were entirely beneath the mark. But if his friends should reject his verses, they could praise his picture, which is indeed the noblest work that had then been completed at Rome. The School of Athens immediately followed the Disputa, taking Raphael into the pre-Christian period of Plato and Aristotle. The picture embodied old philosophy and sciences. It was laid out in a temple planned for Raphael by Bramante, in which the philosophers met, appropriately clad in the dress of the ancient Greeks, surrounded by statues and bas-reliefs, which all gave occasion to the painter to transport his spectators into an almost forgotten realm. The manner in which he reproduced antique character and costume, in action, movement, and expression, is acknowledged to have been worthy of the man who succeeded in displaying with a single effort the progress made by Italian painters from the days of Giotto to those of Ghirlandajo. The Parnassus which came after the School of Athens takes us back to the age of Greek verse, showing us Apollo and the Muses attended by the poets from Homer to Ovid, and escorted by Dante. Raphael admirably transformed the antique into something living and present to the moderns, infusing into groups and figures the life of a scenic actuality. The allegory of Prudence, which came next, is less natural than the Parnassus, but rescued from affectedness by grace of lines and skill in pictorial treatment. The subordinate pictures of the Pope accepting the Decretals, Justinian receiving the Pandects, and Augustus saving the manuscripts of Virgil are worthy adjuncts to the principal themes. Julius II. asked Raphael to introduce his portrait into the Decretals, and the likeness of the pontiff with a beard enables us to fix the date of the completion of the Chamber of the Signature in the middle of August 1511. On the same day that Julius II. was privileged to witness the completion of Raphael's first cycle of wall-paintings he officiated at mass in the Sixtine Chapel, where the first half of Michaelangelo's ceiling was uncovered.

During the progress of the works in which he employed and formed the talents of his disciples, Giovanni da Udine, Penni, and Giulio Romano, Raphael divided his time between the labours of the Vatican and easel-pictures. The portraits of Julius II. and the Virgin of the Popolo, of which copies have come down to us, were executed; drawings were furnished to the copper-plate-engraver Marcantonio for the Massacre of the Innocents; and Madonnas and Holy Families were composed, of which it is only possible here to give the names—Madonnas of Alba at St Petersburg, of Garvagh at the National Gallery, of Mr Rogers, of the Diadem at the Louvre. Nothing could exceed the impatience of Julius to get the chambers of the Vatican properly decorated. He urged Raphael not in vain to begin the chamber of Heliodorus, and in a comparatively short time the master produced, with clever help from his disciples, the ceiling, in which the Eternal appears to Noah, Abraham's Sacrifice, Jacob's Dream, and the Burning Bush. In all these compositions Raphael's mastery is great, and his figures of the Eternal are majestic. The Expulsion of Heliodorus and the Mass of Bolsena are planned so that by a pictorial license the pontiff is present as the scenes are enacted. The death of Julius early in 1513 but slightly interrupted the labours of the painter, who gave a noble rendering of Leo X. and his suite in the picture of the Defeat of Attila. The Deliverance of Peter, which closed the decorations, was an effective piece of composition, in which Raphael for once indulged in contrasts of torch and moonlight and glare balanced by powerful gloom. The constant employment of disciples enabled Raphael, in the three years which elapsed between the completion of the two chambers—i.e. between 1511 and 1514—to finish the Madonna di Foligno at Rome, the Isaiah of St Agostino at Rome, the Galatea of the Farnesina, and the Sibyls of the Pace, not to speak of the mosaics of the Popolo ordered by Agostino Chigi. In many of these works Raphael's style is equal to that of Michaelangelo at the Sixtine, with the additional charm of a grace which was his own. He also laid the antique under contribution with great skill and success, and his art was that of a master who works without hesitation because ready for every form of effort that can be required of him. In a graver mood he also painted at this time the severe Madonna of the Fish at Madrid, in a playfully sweet mood the Madonna della Sedia at Florence; whilst in portraits such as Altoviti at Munich, and Inghirami at Florence, he rises to the perfect rendering of features and expression which finds its greatest triumph in the Leo X. of Florence.

Raphael, who had been greatly favoured by Julius, became a personal favourite of Leo, who selected him to succeed Bramante as architect of St Peter's in 1514, and afterwards made him inspector of Roman ruins. But he was as impatient as his predecessor to get the Vatican chambers finished, and he successfully obtained from the masters the frescoes of the Camera dell' Incendio, which all illustrate scenes from the lives of Leonine popes: the Fire of Borgo, in which all the remnants of Roman buildings known to Raphael are introduced, the Battle of Ostia against the Saracens, the Coronation of Charlemagne, and the Oath of Leo III. But Raphael was now too busy to attend personally to wall-painting, and much of his attention was taken up with the composition of the cartoons which he executed, with help from assistants, for the tapestries of the Sixtine Chapel. It would be impossible to describe these masterpieces or the tapestries made from them in the space here at our command. The cartoons may be seen at the Kensington Museum, the tapestries at the Vatican. They are masterpieces worthy of a pilgrimage; the first completed in December 1516, the second woven at Brussels in 1519. At this period of his career Raphael was a welcome guest in the best circles of Rome, painted the likenesses of the pope's relatives, Giuliano and Lorenzo de' Medici, and was asked in vain for pictures by the Duke of Ferrara. His portraits of the Duke of Urbino, Castiglione, Bembo, Navagero, and his decoration of Cardinal Bibiena's rooms at the Vatican tell of the company which he frequented. When Leo X. succumbed to Francis I. after Marignano Raphael followed the pontiff to Florence and Bologna, and found there the new patrons for whom he executed the Sixtine Madonna, the St Cecilia of Bologna,

and the Ezechiel of the Pitti. The labours subsequently completed were immense, including the Spasimo at Madrid, the Holy Family and St Michael, which the pope sent to the king of France in 1518, and the likeness of the vice-queen of Aragon, followed by the celebrated portrait of the Violin-player of the Sciarra collection at Rome. Wall-painting, with help from the assistants, was diligently carried on, and produced the cycle of the Psyche legend at the Farnesina, the gospel-scenes of the Loggie of the Vatican, and the frescoes of the Hall of Constantine. The last work done in the master's painting-room was the Transfiguration, which was nearly finished when Raphael died of a pernicious fever caught in the excavations of Rome. He expired on the 6th of April 1520, after a week's illness.

B. Cavalcaselle (1882).

Raphania, or ERGOTISM, is a disease which was much more prevalent some centuries ago than it is at present. The name *raphania* was first given to it by Linnæus, who thought the morbid symptoms were dependent upon the mixture of *Raphanus Raphanistrum*, or jointed charlock, with the wheat used as food. It was suspected, as early as the end of the 16th century, that the disease was due to the development of a fungus in the grain, and this fact is now established beyond doubt, although some writers hold (as Linnæus did) that this morbid state is also produced by the presence of poisonous plants, especially *Lolium temulentum*, or darnel, among the grain. Deficiency of proper food probably contributes to cause the disease, for it rarely occurs when ergot is used medicinally. Although rye is the ordinary seat of the poisonous fungus, wheat, rice, and other grains are liable to be similarly affected, and to produce similar results. See ERGOT.

There are two forms of the disease—the spasmodic and the gangrenous. In both, symptoms of irritation of the digestive organs are the first to appear. In the spasmodic form tingling or itching of various parts of the body, with loss of sensation in the feet and hands, are the most constant symptoms. Violent contractions of the muscles may occur, giving rise to intense pain, and sometimes epileptic convulsions supervene. In the gangrenous form the extremities are painful, red but cold, and not easily moved; and after a varying time gangrene supervenes. With regard to treatment, the main thing is to replace the poisonous flour by easily digested, wholesome food. Whatever be the form of treatment adopted, the mortality in the gangrenous form is usually 90 per cent. The spasmodic form is much less destructive to life.

Raphia, the name of a group of palms (see Vol. VII. p. 722), the leaves, bark, and pith of which are used for various purposes. The bast of one South American species, *R. tædigera* or Jupati-palm, is largely used by gardeners everywhere for tying up plants, in fastening grafts, &c. And the midribs of the leaves of another species, found in Madagascar, &c., are supposed to be what was taken for 'roc's quills,' the feathers of the fabled Roc (q.v.).

Raphoe, a market-town of Donegal, 15 miles SSW. of Londonderry. Its former see was united to Derry in 1835. Pop. 986.

Rapidan, a river of Virginia, and tributary of the Rappahannock (q.v.).

Rapids. See WATERFALL, RIVER, NIAGARA, NILE, PARANÁ, &c.

Rapier, a light, highly-tempered, edgeless, thrusting weapon, finely pointed, and about 3 feet in length. It was for long the favourite weapon in duelling, and was worn by every gentleman. At present it is worn only on occasions of court ceremonial, and answers no other purpose than to incommode the wearer. Instructions for Fencing (q.v.) are for fencing with the rapier or foil. See SWORD.

Rapin de Thoyras, PAUL DE, a French historian of England, was descended from a Protestant Savoyard family, which settled in France in the 16th century, and was born at Castres, in Languedoc, March 25, 1661. He studied at the Protestant college at Saumur, and passed as advocate in 1679, but had no liking for the profession; and when the revocation of the Edict of Nantes (1685) forced him to leave France he sought employment without success in England, and afterwards in Holland, where he enlisted in a corps of volunteers at Utrecht, formed by his cousin-german, Daniel de Rapin. With his company he followed the Prince of Orange to England in 1688, was made ensign in the following year, and distinguished himself by his bravery at the siege of Carrickfergus, the battle of the Boyne, and the siege of Limerick, where he was shot through the shoulder by a musket-ball. In 1693 he was appointed tutor to the Earl of Portland's son, with whom he travelled in Holland, Germany, and Italy, after which he took up his residence at the Hague, but in 1707 withdrew with his family to Wesel, where he devoted the remaining seventeen years of his life to the composition of his great work. The severity of his labours is believed to have shortened his days. He died May 16, 1725. Rapin's *Histoire d'Angleterre* was published at the Hague in 8 vols. the year before his death. It was undoubtedly, as Voltaire has said, the best work on English history that had until then appeared; full, minute, careful in the citation of authorities, clear, rapid, and accurate in narration, methodical in the arrangement of its materials, comparatively impartial in spirit, and yet betraying on the part of the author an honourable reverence for law and liberty.

Rapin begins with the invasion of Britain by the Romans, and ends with the accession of William III. The work was continued to the death of William III. by David Durant (Hague, 2 vols. 1734). The best edition of the *Histoire* in its augmented form is by Lefebvre de Saint-Marc (Hague, 16 vols. 1749 *et seq.*). The original was translated into English by the Rev. Nicholas Tindal (Lond. 15 vols. 1725-31), and subsequently by John Kelly (in 2 vols. fol.).

Rapp, GEORGE, founder of the sect of Harmonists, was born in Württemberg in 1770, and, after an attempt to restore the church of New Testament days in Germany, emigrated with his followers to Western Pennsylvania in 1803. There he established a settlement which he named Harmony (whence the early title of the sect, Harmonists or Harmonites). In 1815 the community removed to Indiana, and founded New Harmony (q.v.); but this was sold in 1824 to Robert Owen, and Rapp and his followers returned to Pennsylvania, where they built Economy, a village on the right bank of the Ohio, 15 miles NW. of Pittsburg, and engaged in farming. There Rapp died, 7th August 1847. Impressed with the certainty of the speedy second coming of Christ,

his absorbing aim was to amass great wealth, to be placed then at the Lord's disposal. To this end he and his followers practised a rigid economy, and lived a life of toil and self-denial, in which celibacy formed a part; and with the same object, all things were held in common. As the years passed the community became wealthy indeed, and it is now the owner of great farms and dairies, and of vineyards that are famous, and is said besides to hold millions of dollars' worth of railway and bank shares. Its numbers, however, have not increased, and in 1890 did not exceed seventy.

Rapp, Jean, Count, a French general, was born at Colmar, in the French department of Haut-Rhin, 27th April 1772. He was intended for the church, but his taste for a military life led him to enrol himself (1788) in the mounted 'chasseurs' of the French army. Rapp distinguished himself by dashing gallantry in Germany and Egypt, and on the death of Desaix at Marengo he became aide-de-camp to Napoleon. His brilliant charge at Austerlitz upon the Russian Imperial Guard was rewarded with the grade of general of division (1805). For his services at Lobau he was named a Count of the Empire (1809). He opposed the Russian expedition, but accompanied the Emperor throughout the whole of it. His obstinate defence of Danzig for nearly a year against a powerful Russian army gained for him greater renown, and his chivalrous and considerate treatment of the unfortunate inhabitants during the siege was warmly appreciated by them. The Russians, contrary to the articles of capitulation, sent Rapp and his garrison prisoners to Russia, and he did not return to France till July 1814. On reaching Paris he was well received by Louis XVIII.; but in 1815 he went over to his old master, and was appointed commander-in-chief of the army of the Rhine, and peer of France. After Waterloo Rapp again submitted to Louis. Re-created a peer of France (1819), he held various offices about the court, and died at Paris, 8th November 1821. See his Memoirs (1823), and Spach's *Biographies Alsaciennes* (1871).

Rappahannock, a river of Virginia, rises in the Blue Ridge of the Alleghany Mountains, receives the Rapidan (above this point it is sometimes called the North Fork), and flows about 125 miles south-east to Chesapeake Bay. It is tidal and navigable to Fredericksburg. The Rappahannock and the Rapidan were the scenes of some of the bloodiest battles of the Civil War, at Fredericksburg, Chancellorsville, and the Wilderness.

Rappee' (Fr. *râpé*), a coarse kind of snuff. See Tobacco.

Rapperswyl, on the north shore of the Lake of Zurich, has an old castle fitted up in 1869 by a Polish nobleman as a Polish National Museum; pop. 2800.

Raratonga. See Cook Islands.

Rarey. See Horse, Vol. V. p. 795.

Ras (= Heb. *rosh*), an Arabic word, signifying 'head,' 'promontory,' occurs in the names of many capes on the Arabian and north African coasts, and also in Sicily and Malta.

Rashes, affections of the skin, characterised by a red superficial efflorescence, diffused or in patches, disappearing under pressure, and usually ending in desquamation. To this division of cutaneous disorders belong Measles, Scarlatina (or Scarlet Fever), Erysipelas, Erythema, Roseola (or Scarlet Rash), and Nettle Rash. Of these rashes Measles, Scarlatina, and Erysipelas are rather to be regarded as fevers or blood diseases than as cutaneous diseases in the true sense of the phrase.

Rashi (from the initials of Rabbi Shelomo Izaaki, often erroneously called Jarchi), the greatest Jewish commentator and exegete, was born about 1040, at Troyes, in France. Philology, philosophy, medicine, astronomy, civil and ecclesiastical law, and exegesis were the chief branches of his learning; and to a rare proficiency in them he united a complete mastery over the whole range of Scripture and the Talmudical sources. In order further to perfect himself for his gigantic task he travelled for seven years, visiting the schools of Italy, Greece, Germany, Palestine, Egypt. His chief work is his Commentary on the whole of the Old Testament. Rashi's style is extremely brief and concise, yet clear and pregnant; obscure and abstruse only to those who lack the necessary preliminary knowledge. According to the fashion of its day, it is replete with allegorical or rather poetical illustrations, gathered from the wide fields of the Midrash within and without the Talmud. This Commentary—entirely translated into Latin by Breithanpt, and partly also into German—was the first book ever printed in Hebrew (Reggio, 1474). Of his numerous other works may be mentioned his Commentary on the Babylonian Talmud; a Commentary to the *Pirke Aboth;* the *Pardes*, treating of Laws and Ceremonies; a Collection of Legal Votes and Decisions; a Commentary on Midrash Rabbah; a Book of Medicine; and a Poem on the Unity of God. He died 13th July 1105; and such was his piety and his surpassing eminence that later generations wove a shining garland of legends around his head.

Rask, Rasmus Christian, philologist, was born at Brändekilde, near Odense, in the island of Fünen, 22d November 1787, studied at Copenhagen, and in 1808 published his first work on the rules of the Icelandic language. During the years 1807–12 he occupied himself with drawing up grammatical systems for most of the Germanic, Slavonic, and Romance tongues, and in comparing them with those of India. He then visited Sweden, and in 1813 proceeded to Iceland, where he lived for three years. On his return to Copenhagen he was appointed sub-librarian to the university, and in 1818 published his splendid researches concerning the origin of the Icelandic language. After spending a year (1817) in Stockholm, where he published his admirable Anglo-Saxon grammar and the first critical edition of the *Snorra Edda* and the *Edda Saemundar*, he went to St Petersburg, and there devoted himself for two years to the study of the oriental languages, principally Sanskrit, Persian, and Arabic, while at the same time he also acquired a competent knowledge of Russian and Finnish. Thus equipped, he proceeded to Astrakhan, and then commenced a journey through the country of the Turkomans, the Caucasus, Persia (adding meanwhile the Mongol and Manchu dialects to his already enormous linguistic acquisitions), and finally Ceylon, where he made himself acquainted with Singhalese and Pali, and wrote his *Singalesisk Skriftlaere* (1822). In 1823 Rask returned to Copenhagen, laden with learning and rare manuscript treasures, of which the greatest part was presented to the university. In 1825 he was appointed professor of Literary History, in 1828 of Oriental Languages, and in 1831 of Icelandic. But his immense labours had exhausted his energies, and he died, 14th November 1832, at the early age of forty-five, a victim of hard work. Rask also wrote on Frisian grammar (1825), on ancient Egyptian chronology (1827), on Hebrew chronology (1828), grammars of several languages, and a great number of miscellaneous articles in the learned journals of the North, which were collected after his death, and published (3 vols. 1834–38). There are English editions of his Anglo-Saxon,

Danish, and Icelandic grammars. See the Lives by Petersen (1870) and Rönning (1887).

Raskolniks, the name of a variety of sects in the Russian Church. See RUSSIA.

Raspail, FRANÇOIS VINCENT (1794–1878), a French chemist, doctor, and revolutionist, whose camphor-system (1845) was a forerunner of antiseptic surgery. See a monograph on him by Saint-Martin (Paris, 1877).

Raspberry (*Rubus Idæus*), the most valued of all the species of Rubus (q.v.). The characters of the leaves, flowers, and fruit of raspberry are well

Raspberry (*Rubus Idæus*).

illustrated in the accompanying figure. The wild raspberry has scarlet fruit, and is found in thickets and woods throughout the whole of Europe and the north of Asia. It is common in Britain. The raspberry has long been in cultivation for its fruit. There are many cultivated varieties, with red, yellow, and white fruit, much exceeding the wild kind in size. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. Plantations of raspberries are most easily made by means of suckers. The raspberry loves a light rich soil, and is rather partial to a shady situation. The tall kinds are unsuitable in situations much exposed to winds, as the stems are easily broken. The rows are generally about 4 feet apart, the plants 3 to 4 feet apart in the rows. The young stems are thinned out to allow free access of air to those which are left. Stakes are often used to support the stems, or they are variously tied together. The fruit is used for dessert; for jams, jellies, &c.; for making or flavouring many kinds of sweetmeats; and, mixed with brandy, wine, or vinegar, for the preparation of *Raspberry Syrup*, *Raspberry Vinegar*, &c. Different preparations of it are used in medicine in cases of fever, inflammation, &c. Raspberry vinegar is a particularly grateful and cooling drink in fevers. Raspberries, fermented either alone or along with currants and cherries, yield a strong and very agreeable wine, from which a very powerful spirit can be made. Some of the other species of Rubus most nearly resembling the raspberry produce also agreeable fruits. *R. odoratus* is a highly ornamental shrub, a native of Canada and the northern states of America, is frequent in gardens in Europe and America, but rarely produces fruit in Britain.

Raspe, J. E. See MUNCHAUSEN.

Rassam, HORMUZD, Assyriologist, was born, the son of Chaldean Christian parents, at Mosul in Mesopotamia in 1826. He gained the friendship of Layard, and assisted him in his excavations at Nineveh in 1845–47 and 1849–51, and then succeeded him, until 1854, as British agent for conducting Assyrian explorations. His grandest success was the finding of the palace of Assurbani-Pal (Sardanapalus). After holding in the following years political offices at Aden and Muscat, he was sent (1864) by the British government to Abyssinia, to demand the release of the Europeans kept in prison by King Theodore; but that potentate cast him also into prison, and only released him with the rest of his captives after his army had been defeated by Sir R. Napier in 1868. From 1876 to 1882 Rassam was employed by the trustees of the British Museum in making explorations in Mesopotamia, and discovered Sepharvaim (Sippara) and Kuthah. He published *The British Mission to Theodore, King of Abyssinia* (1869).

Rastatt, or RASTADT, a town and first-class fortress in Baden, stands on the Murg, 3 miles from its junction with the Rhine, and 15 miles SW. of Carlsruhe. Steel wares, beer, and tobacco are manufactured. From 1725 to 1771 the town was the residence of the Margraves of Baden-Baden. The present fortifications were erected in 1840–48 by Austrian engineers to protect the northern entrance to the Black Forest. Rastatt is memorable for two congresses—the first in 1714, when a treaty of peace, which brought the war of the Spanish Succession to a close, was signed between Marshal Villars and Prince Eugene; and the second in 1797–99. On the breaking up of this latter congress without any definite result the three French plenipotentiaries set out for Strasburg; but they had scarcely got beyond the gates of Rastatt when they were attacked by Austrian hussars, and two of the three slain, whilst the third was left for dead in a ditch. Their papers were carried off, but no further spoil was taken. It seems that the Archduke Charles gave orders to the hussars to drive the French representatives out of Rastatt and take away their papers; the killing was the work of the officers, misunderstanding their orders. The town played a prominent part in 1849 as the stronghold of the revolutionists in Baden. Pop. (1895) 13,276.

Rat, a name applied to the larger species of the rodent genus Mus, but especially to the Brown Rat (*M. decumanus*) and the Black Rat (*M. rattus*). Like the mice, which are included in the same genus, rats are agile and graceful animals, skilful in burrowing, predominantly nocturnal. The bright eyes, large ears, naked muzzle, soft fur, and long scaly tail are familiar external characteristics. The brown or Norway rat measures about eight inches in length, not including the tail, which is usually shorter than the body. It is grayish-brown in colour, with flesh-coloured ears, feet, and tail. Black varieties sometimes occur. It is believed to have travelled gradually westwards, perhaps from China, and did not reach France or Britain till towards the middle of the last century. In 1727 swarms swam across the Volga, and rapidly spread over Europe, dispossessing the black rat which had arrived some centuries before. According to some, the black rat was brought to Britain in 1732 in ships from the East Indies. As a common stowaway in ships, it has been distributed over the world, reaching America about 1775. The black rat is smaller and slimmer than the brown rat. The head and body measure six or seven inches in length; the tail is an inch or two longer. The head is more slender than in the brown rat, and the ears are rather larger. In most the colour is glossy black, but white and piebald varieties may occur. It is less fierce than the brown rat, and seems to be less distinctively a burrowing rodent, preferring the upper parts of houses to the cellars. Its original home seems to

have been in the East, perhaps in Persia, but it must have reached northern Europe by the 13th century at least, for its troublesome presence is noticed by Albertus Magnus.

These species of rat have similar habits, and the stronger, larger, and fiercer form sometimes tends to exterminate the other, this being one of the few instances which Darwin gives of his conclusion that the struggle for existence is keenest between closely allied species. As to the habits of rats, it is well known that they find their way everywhere; no door is shut to them; they gnaw and burrow through almost all obstacles. They run and leap, they climb and swim. They are fond of animal food, but will eat almost anything; corn, fodder, all kinds of human food, eggs, young birds, small mammals, all is grist to their mill. In illustration of their voracity it is often related that in a slaughter-house near Paris thirty-five dead horses were picked to the bones in a single night. When pressed by hunger they display much boldness, and their skill in stealing even such unmanageable

Black Rat (*Mus rattus*); Brown Rat (*Mus decumanus*).

goods as eggs is well known. Their senses, especially of smell and hearing, are acute, and their intelligence is well developed. The mothers are careful of their tender offspring, but the males display the reverse of parental affection. The albinos are delightful pets. Brehm cites several strange observations in regard to the so-called 'rat-kings,' which consist apparently of a number of diseased rats with entangled tails. It is said that over two dozen individuals have been found thus entangled. Rats are very prolific, breeding four or five times a year. Four to ten young are brought forth at a birth, after a very short gestation of about three weeks. Moreover, the young become sexually mature in about six months. All the conditions favour rapid increase, and plagues of rats by no means easy to cope with not unfrequently occur. Rats do much damage in various ways—by their burrows, by their voracious gnawing of all sorts of things, by their omnivorous appetite. They undermine walls, destroy woodwork, devour stores. When pressed with hunger they may attack large mammals, and even man himself sometimes falls a victim. They have been known to eat holes in fat pigs, to gnaw off the legs of birds, and even to destroy the soles of elephants' feet. Their destruction may in many cases be left to their natural enemies—birds of prey and carnivorous mammals—but it is often necessary to resort to the use of traps and poisons. One of the most effective ways of destroying them is to feed them with a mixture of meal and plaster of Paris. Their skin is sometimes used for making glove-leather; and their flesh, according to *The Farmer's Friends and Foes*, by Theodore Wood (1887), is, if similarly cooked, superior to rabbit.

There are several genera nearly related to Mus—e.g. Nesocia, of which an East Indian species, the Bandicoot-rat (*N. bandicota*), may measure over a foot in length; Hapalotis, represented by little jerboa-like animals in Australia; Echinothrix, with one species in Celebes, a rat with a very long muzzle, and spines among the fur; Cricetomys, represented by a formidable African species (*C. gambianus*) of large size and ferocious voracity. To some more remotely related rodents the term rat is often popularly applied—e.g. to the Water-vole (*Arvicola amphibius;* see VOLE), and to the American Musk-rat (*Fiber zibethicus*). See MOUSE, RODENTIA.

Rata (*Metrosideros robusta*), a New Zealand tree related to various species of Ironwood (q.v.). The seed is believed to be swallowed by a caterpillar, and to sprout in its interior, the fostering grub being of course killed. The tree begins life as a climber, attached to other forest-trees, and attains a height of 150 feet; but when it has killed the supporting stem the rata is able to sustain its own weight and to grow on as an independent tree, attaining ultimately a height of near 200 feet. The wood is very hard, formerly much used for making clubs, and is valuable for shipbuilding. See Abercromby, *Sea and Skies* (1889).

Ratafi'a, a flavouring essence made with the essential Oil of Almonds (q.v.). The name is sometimes given to other essences.

Ratak. See MARSHALL ISLANDS.

Ratcliffe Tables. See FRIENDLY SOCIETIES.

Rate. See BOROUGH, COUNTY, POOR-LAWS, TAXATION.

Ratel (*Mellivora*), a genus of quadrupeds of the Bear family (Arctoidea), nearly allied to the Gluttons (q.v.), from which it differs in having one false molar less in each jaw and the upper tubercular teeth slightly developed. The general aspect is similar to that of the badgers, but heavier and more clumsy. Three species are known, which inhabit Africa and India; one species, the Cape Ratel (*M. ratel* or *capensis*), inhabits the south of

The Cape Ratel (*Mellivora ratel*).

Africa, and is said to feed much on bees and their honey, its thick fur protecting it against their stings; the other inhabits the north of India, prowls about by night, is a voracious devourer of animal food, and often scratches up recently interred bodies from their graves. The Cape ratel is about the size of a badger, gray above, black below. It is easily tamed, and is amusingly active in confinement, continually running about its cage, and tumbling strange somersaults to attract the attention of spectators, from which it seems to derive great pleasure.

Rath, the Irish name for a prehistoric Hill-fort (q.v.).

Rathenow, a town of Prussia, on the right bank of the Havel (here crossed by a stone bridge), 43 miles by rail W. by N. of Berlin. Optical instruments, wooden wares, machinery, bricks and tiles, are made. Pop. (1895) 18,418.

Rathkeale, a town of Ireland, on the river Deel, 19 miles SW. of Limerick by rail. Pop. 2549.

Rathlin, a crescent-shaped island off the coast of Antrim, 6½ miles N. of Ballycastle. Measuring 6½ by 1½ miles, and 3398 acres in area, it has fine cliffs, consists of columnar basalt and limestone, and attains a maximum altitude of 449 feet. The soil in the valleys is fertile, but fishing is the leading industry, the kelp-manufacture being quite extinct. Rathlin is identified with the *Ricinia* of Ptolemy, *Ricnia* of Pliny, and *Raghlin* or *Ragherin* ('fortress of Ireland') of later writers. St Columba established a church here in the 6th century; and Bruce in 1306 took refuge in a castle, now a ruin. Pop. (1841) 1039; (1891) 365.

Ratibor, a town of Prussian Silesia, stands on the left bank of the Oder, 44 miles SSE. of Oppeln. It is the chief town of the principality of Ratibor, which, a sovereign duchy from 1288 to 1532, has since 1742 been subject to Prussia. The town manufactures tobacco, shoes, paper, glass, sugar, furniture, &c., and has large ironworks. Pop. (1875) 17,269; (1890) 20,578.

Ratich, Wolfgang (sometimes called Ratke or Latinised as Ratichius), educationist, was born at Holstein in 1571, based a new system of education on Bacon's philosophy, which he expounded to the German princes at Frankfort in 1612, and had an opportunity of putting into practice at Köthen in 1618, by favour of the prince of Anhalt. His principle was the realistic one of proceeding from things to names, and from the mother-tongue to the study of foreign ones. But he got into bad relations with the clergy and with his patron, and was actually imprisoned for eight months. A second chance given him at Magdeburg in 1620 ended also in failure, and after some years of ineffective wanderings he died at Erfurt in 1635.

There are monographs on him by Krause (1872), Störl (1876), and Schumann (1876); and see R. H. Quick, *Essays on Educational Reformers* (1868; new ed. 1890).

Ratio. See Proportion, Fluxions.

Ration, in the British Army, is the allowance of provisions granted to each officer on service and in some colonies, and to each non-commissioned officer and soldier at all times unless on furlough or otherwise specially provided for. The ordinary ration is ¾ lb. of meat, with 1 lb. of bread ('best seconds'), increased by ¼ lb. of meat when in camp or abroad. Sometimes a grocery ration (tea or coffee, sugar, salt, &c.) is also issued, 1½d. being then deducted from the pay of the recipient. When men are not supplied with bread and meat rations an allowance of 6d. per diem is granted them. The bread ration may be increased during operations in the field, though not above 1¼ lb. of bread or 1 lb. of biscuit, and the officer commanding may direct the issue in addition of wine, spirits, or any other article of subsistence equivalent thereto. The families of soldiers accompanying them abroad are allowed the following: the wife (married under regulations), half a ration; each legitimate child under fourteen, quarter ration. A ration of forage at home consists of 10 lb. of oats, 12 lb. of hay, and 8 lb. of straw for each horse. An extra 2 lb. of oats is allowed in camp. Staff-officers and mounted officers of infantry provide their own forage except on active service, and are granted a pecuniary allowance of about 1s. 7d. (varying with the locality) per day to enable them to do so.

The full navy ration consists of the following articles: Daily—1¼ lb. of ship-biscuit or 1½ lb. of soft bread, ½ pint of spirit, 2 oz. sugar, 1 oz. chocolate, ¼ oz. tea; 1 lb. fresh meat and ½ lb. of fresh vegetables, when these are procurable; otherwise, 1 lb. salt pork, with ⅓ pint split peas, or 1 lb. of salt beef, with 9 oz. flour, ¾ oz. suet, and 1½ oz. of currants or raisins. On alternate salt-beef days—2 oz. preserved potatoes. Weekly—¼ pint oatmeal, ½ oz. mustard, ¼ oz. pepper, ¼ pint vinegar. The sailor's ration is issued free of any stoppage.

Rationalism, as 'a system of belief regulated by reason,' might be expected to mean the opposite of irrationality, crass ignorance, and perverse prejudice; and the growth of rationalism would then mean the progress of civilisation, the development of the intellectual and moral nature of men and nations. It is nearly in this sense that Lecky uses the word; attributing to its wholesome influence the decay of the belief in magic, witchcraft, and other hideous superstitions, and the substitution of a kindly tolerance in place of blind zeal for persecution.

But in ordinary English usage, general as well as theological, the connotation of the word is substantially different. It is generally employed as a term of reproach for those who, without utterly denying or attempting to overthrow the foundations of religion, make such concessions to the enemy as tend to subvert the faith; who admit the thin end of a wedge that pressed home will rend and destroy the fabric. They rely, more or less exclusively and blameworthily, on mere human reason instead of simply, frankly, and fully accepting the dicta of the divine word. An atheist would not be spoken of as a rationalist, nor would an irreligious, blaspheming freethinker. Rationalists in ordinary parlance are those who are more 'liberal' or 'advanced' than the main body of the orthodox; in especial those who take a 'low' view of inspiration, and minimise or explain away the miraculous details of the history of revelation and redemption. Rationalism is not so much a body of doctrine as a mood of mind, a tendency of thought shown in the attempt to apply to religious doctrine, the sacred story, and the sacred scriptures the same methods of research and proof as are used in mere human science and history, and the literatures of all times and peoples. This feature is also recognised, though with approval, by Lecky in his wider use of the word: 'Rationalism,' he says, 'leads men on all occasions to subordinate dogmatic theology to the dictates of reason and conscience. . . . It predisposes men in history to attribute all kinds of phenomena to natural rather than to miraculous causes; in theology to esteem succeeding religious systems the expression of the wants and aspirations of that religious sentiment which is implanted in man; and in ethics to regard as duties only those which conscience reveals to be such.' Rationalism, not being a system but a temper or drift of mind, has different aims at different times; just as 'liberalism' in politics was not the same thing before 1832 as it came to be after, or in 1832 what it was in 1867, 1885, or 1890. Opinions are heard in sermons and expounded in books by theological professors in 1891 without proving serious stumbling-blocks to the majority, which in 1860 would by all but a small minority have been regarded as distinctly rationalistic. Thus, till lately it was alarming rationalism to dispute the Mosaic authorship of Genesis, the Solomonic authorship of the Song of Songs, and the Davidic authorship of any of the Psalms; now the newer view is assumed by many orthodox teachers. And in the last quarter of the 19th century scholars earnestly

support views which they themselves treated as highly dangerous twenty or thirty years earlier. Rationalism of this kind is a transition stage, but not necessarily a transition to unbelief.

The rationalistic temper may be traced in almost every age of the church's history: no doubt the extremer representatives of the Petrine party in sub-apostolic times regarded Paul's views as lax and rationalistic. If the Reformation was not rooted in rationalism (as to Catholics it seems to have been), many of the contentions of the reformers were such as all rationalists accept and sympathise with. Zwingli was a rationalist to Luther and the Lutherans; Socinus was of course a rationalist of an extreme type. The dry and barren dogmatic orthodoxy of Germany in the 17th century fostered a rationalism as cold and unspiritual. In the England of the 18th century, during the Deistic controversies, the Evangelicals of Germany thought, not altogether unjustly, that some of the most conspicuous opponents of the deists were not themselves free from the charge of rationalism; and the Evangelicals of Scotland regarded the 'moderates' of the 18th century, however orthodox in dogma, as thoroughly rationalistic in spirit. Rationalism is not so much opposed to orthodoxy as to mysticism, and what was called variously fanaticism, enthusiasm, 'high-flying,' and methodism. A soulless orthodoxy has not seldom been opposed by a fervent piety that by a not unnatural antithesis has tended to run into heretical extremes; while, on the other hand, actual rationalists have often been foremost amongst the champions of religion, and of revealed religion, against radical freethinking, deism, naturalism, and materialism.

In Germany the term rationalism is more definite in its reference than in England, but is not always used in quite the same sense. The two defective and mutually opposed schools of thought that Kant sought to supersede by his critical philosophy were, on the one hand, a shallow empiricism, and on the other a baseless and overweening metaphysical dogmatism or rationalism. Bacon also contrasted empirical philosophers with rationalists who spin their systems as spiders do cobwebs out of their own bowels. Wolff presents the most conspicuous example of the philosophical rationalism which held that all that is in heaven above and earth beneath could be 'proved' by pseudo-mathematical methods: and as God, responsibility, and immortality were amongst the things that could be proved at endless length and in various ways, this philosophical rationalism led directly up to a rationalist theology, which consisted mainly in a series of dogmas to be demonstrated from the philosophical axioms, including some at least of the doctrines of revealed religion. What in revelation could not be demonstrated according to this scheme was disallowed or explained away. Practical religion became in the *Aufklärung* a system of mere utilitarian morals.

Kant prepared the way for a deeper view of man, history, and the universe; but his own explicit statements on positive religion were pronouncedly rationalistic: and the negative side of his philosophy was well calculated to lay the foundations of another school of theological rationalists (often called *Vulgär-rationalismus*), of whom Tieftrunk (died 1837), Bretschneider (1776–1848), and Wegscheider (1771–1849) may be taken as representatives. De Wette (1780–1849) shows the transition to Schleiermacher, who (though in the English sense of the word he was an outspoken rationalist) combined what was best in the opposing schools of rationalists and supernaturalists, founded a higher and truer religious philosophy, and heralded even the 'pectoral theology' of the mediation school.

But it was not in the sphere of speculation and dogma, but in that of biblical criticism, that German rationalism accomplished its main work, and left its deepest mark on subsequent theological development. In the early 18th century the 'Germans in Greek were sadly to seek,' as English scholars thought: the Germans themselves admitted that in studying the Scriptures they failed to escape from dogmatic presuppositions, and that it was the English divines who approached the New Testament in a historical spirit, which in the Germany of that day caused misgivings. It is noteworthy that Semler (1725–91), 'the father of rationalism,' obtained the doctorate for a thesis written against Whiston, Bentley, and other English scholars in defence of the 'three heavenly witnesses' of 1 John, v. 7. Semler in the schools, supported by Lessing and Herder in literature, was soon teaching that the books of the Bible must be studied as human productions: Eichhorn (1752–1827) thoroughly accepted and applied that principle. Rationalist criticism was carried to an absurd length by Paulus (1761–1851), who taught that the Gospels contained natural and not supernatural events, and whose most ingenious but inept 'explanations' of the miracles of the New Testament, 'retaining everywhere the husk but surrendering the religious kernel,' were made a laughing-stock by Strauss. Strauss's 'mythical theory' (excessively rationalist in the English sense of the term) was in its turn superseded by Baur (q.v.) and the new Tübingen school, whose epoch-making work marks the opening of the most recent period in scriptural criticism. The 'notes' of the newer criticism, whether more or less rationalist from the older English point of view, are the conviction that all truth is one, whether derived from the natural sciences, historical research, the dictates of conscience, or the records of divine revelation, and the willingness to accept what is apparently established by the consensus of scholars even where this involves giving up the belief in the inerrancy of Scripture. Many of the contentions of self-confident and aggressive rationalism have long since mutually destroyed one another. Nothing can be more contrary to the true historic and scientific spirit than the assumptions of a reckless sciolism: there is a false and a true rationalism; and it should be remembered that much that is now most surely believed by all has at one time or another been branded as rationalistic.

See the church histories; Tholuck, *Vorgeschichte des Rationalismus* (1853) and *Geschichte des Rationalismus* (1865, unfinished), and earlier monographs by Stäudlin and Rückert; H. J. Rose's essay *On the State of Religion in Protestant Germany* (1825), and Pusey's *Historical Inquiry into the Causes of the Rationalist Character of the Theology of Germany* (1828–30); A. S. Mackay, *The Tübingen School and its Antecedents* (1863); Lecky, *History of Rationalism in Europe* (1865); Hurst, *History of Rationalism* (New York, 1866); Fisher, *Faith and Rationalism* (New York, 1879); Tulloch's *Rational Theology* (1872) and *Movements of Religious Thought* (1885); Draper, *Intellectual Development of Europe* (1867) and *Conflict between Science and Religion* (1874); Cairns, *Unbelief in the Eighteenth Century* (1881); Pfleiderer, *The Development of Theology in Germany since Kant* (Lond. 1890); also the articles in this work on CHURCH HISTORY, REFORMATION, DEISM, EXEGESIS, and works there cited, with the articles on the chief rationalist critics and thinkers.

Ratisbon (Ger. REGENSBURG), a town of Bavaria, stands on the right bank of the Danube, 82 miles by rail NNE. of Munich. Formerly a free city of the empire and seat of the Diet, Ratisbon presents a strongly marked mediæval character, with narrow crooked streets, and high, many-cornered, gabled houses. Among its churches the most

remarkable is the noble Gothic cathedral, begun in 1275, but not completed till 1534, and restored in the 19th century. The Church of St James, formerly belonging to the Irish (*Scoti*) Benedictines, dates from the 12th century, and is built in the pure Byzantine style. The old town-hall was used for a century and a half (1645–1806) as the place of meeting for the imperial diet. At the Golden Cross Inn Charles V. met the mother of his son Don John of Austria. There are numerous interesting private dwellings, as the Thurn and Taxis Palace, with library (40,000 vols.), picture-gallery, &c., the royal villa, and others. A stone bridge (1135–46), 1024 feet long, connects Ratisbon with the busy trading suburb of Stadt am Hof. The manufactures include porcelain and stoneware, brass and steel wares, leather, tobacco, lead-pencils, chemicals, &c.; and there is an active trade, especially in corn and salt. Pop. (1875) 31,487; (1890) 37,365. Originally a Celtic town, Radasbona (whence Ratisbon), this place was made by the Romans a frontier fortress. Later it was the capital of the Dukes of Bavaria. Frederick II. declared it (1245) a free imperial city. During the 14th century it was the chief seat of the Indo-Levantine trade, and was one of the most populous cities of southern Germany. Here were signed the Ratisbon Interim (q.v.) in 1541 and the armistice between France and Austria in 1684. The city was stormed by Duke Bernhard of Weimar in 1633, and by both the Austrians and the French in 1809. It was ceded to Bavaria in 1810. See works by Weininger (7th ed. 1884) and Janner (3 vols. 1883–86).

Ratnagiri, a coast-town of India, 136 miles S. by E. of Bombay, with a fort and sardine-fishery. Pop. 12,616.—The *district* has an area of 3922 sq. m. and a pop. (1891) of 1,105,926.

Rattan, a walking-stick made from the stem of a palm that grows in Sumatra. See PALM, p. 722.

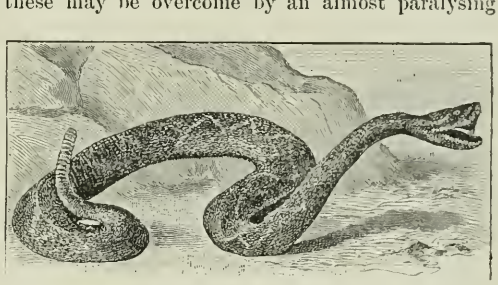
Rattany. See RHATANY.

Rattazzi, URBANO, an Italian statesman, was born at Alessandria, June 29, 1808. He studied law at Turin and practised as an advocate with great success at Casale. After the proclamation of the constitution in 1848 he was elected member of the Second Chamber for Alessandria, and began his political career as a democrat. His eloquence and liberal principles raised him to the ministry: Gioberti made him minister of the Interior and later of Justice; but after the defeat of Novara he was obliged to retire along with the rest of the ministry. When Napoleon III. threatened the liberty of Piedmont, Cavour, Rattazzi, and their parties joined together to defeat his schemes, and in 1853 Rattazzi took the portfolio of Justice under Cavour, and presented the bill for the abolition of convents. Being accused of weakness in suppressing the Mazzinian movement in 1857, he retired from office early in the following year. In 1859, however, he was back again in office as minister of the Interior. The threatened cession of Savoy and Nice, which he opposed, led to his retirement in 1860. Having changed his views on this point, he was in March 1862 entrusted with the formation of a new ministry, but had to resign at the end of the year in consequence of his opposition to Garibaldi; and once more prime-minister for six months in 1867, he lost the post for the same reason. He died at Frosinone, June 5, 1873. A want of stability was his chief drawback as a statesman.

His Speeches were edited by Scovazzi (8 vols. Rome, 1876–80). See a Life by Morelli (Padua, 1874), and *Rattazzi et son Temps* (Paris, 1881).

Rattlesnake (*Crotalus*), a genus of highly specialised venomous snakes, with a rattle of horny rings at the end of the tail. A long fang is borne on each maxilla, and is perforated by a canal, down which the venomous secretion of a modified salivary gland flows when the rattler strikes. Behind each fang are several reserve fangs, which replace it after breakage—a not unfrequent result of the bite. There are about fifteen species, exclusively American. Of these the Banded Rattlesnake (*C. horridus*) is abundantly distributed from Maine to Texas. Its maximum length seems to be about four feet, and the rattles have been known to consist of twenty-three rings, but forms and rattles so large are very rare. The predominant colour of the body varies from yellow to almost black. Among the other species are *C. durissus* (Mexico to Brazil), *C. molossus* (Mexico and Arizona), *C. lucifer* (California and other western regions), the Diamond Rattler—*C. adamanteus* (California and Mexico), the Horned Rattler—*C. cerastes* (California, Arizona, and Mexico).

Rattlesnakes are naturally sluggish and prefer defensive to offensive tactics, except when on the track of their natural prey—rabbits, rats, squirrels, and other small mammals. Not a few ideas about rattlesnakes must be dismissed as false: they do not fascinate or charm mammals or birds, though these may be overcome by an almost paralysing



Rattlesnake (*Crotalus horridus*) in act of striking.

fear; the rattling does not lure prey nor attract mates, but is rather a reflex expression of excitement, apparently warning off molesters on whom the snake is doubtless unwilling to expend energy in the exhausting act of striking; finally, the number of rings does not necessarily indicate the age of the animal, though new rings seem to be added at successive sloughings. Rattlesnakes are generally nocturnal. The young are brought forth alive. The poison is very deadly, rapidly paralysing the nerve-centres and affecting the respiratory and circulatory functions. When a man is bitten it is customary to ligature above the wound, to suck out the poison, to use stimulants freely, and to inject antidotes such as permanganate of potash. Often, however, the result of the bite is fatal (see SNAKE).

Rattray, a police burgh of Perthshire, on the Ericht, opposite Blairgowrie. Pop. 2227.

Rauch, CHRISTIAN DANIEL, sculptor, was born at Arolsen, in Waldeck, 2d January 1777. In 1797 he became valet to Frederick-William III., king of Prussia, but, resolving to devote himself to art, was enabled by the generosity of a nobleman to study at Rome, where he enjoyed the friendship of Thorwaldsen, Canova, and Wilhelm von Humboldt, the Prussian minister. In 1811 he was called by the king of Prussia to Berlin to execute the monumental statue of Queen Louisa now at Charlottenburg. Rauch was not, however, quite satisfied with this triumph of his art, but commenced a new statue of the queen, which he finished eleven years afterwards, a masterpiece of sculpture, now in the palace of Sans Souci. After this he lived principally at Berlin, but occasionally visited Rome, Carrara, and Munich. He laboured indefatigably

in his profession, and by 1824 had executed seventy busts in marble, of which twenty were of colossal size. His works include two colossal bronze statues of Field-marshal Blücher (1827), a bronze statue of Maximilian of Bavaria (1835), and statues of Albert Dürer, Goethe, Schiller, and Schleiermacher. His masterpiece is the magnificent monument of Frederick the Great (1851) which adorns Berlin. He died at Dresden, 3d December 1857. See Life by Eggers (1873–90).

Rauhes Haus ('the Rough House,' so called) is the name of a great institution founded and managed by Johann Heinrich Wichern (1808–81) at Horn, near Hamburg, in connection with the German Home Mission (*Innere Mission*). It is partly a refuge for morally neglected children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, &c., in promotion of the objects of the Home Mission. It was opened on November 1, 1831, by Wichern with twelve neglected children. By the addition of new houses the whole has, however, been very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinders' shop, and book-selling form part of the institution. The children live in families of twelve, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor manual labour. In connection with the Rauhes Haus there was founded in 1845 a kind of conventual institute for the education of young men as heads or superintendents of similar institutions. See works on the subject by Wichern (1833–83).

Raumer, Friedrich Ludwig Georg von, German historian, was born at Wörlitz, near Dessau, in the duchy of Anhalt, on 14th May 1781, studied law at Halle and Göttingen, and entered the Prussian state service in 1801. In 1811 he accepted the chair of History and Politics at Breslau; in 1819 he was called to fill the similar chair at Berlin. He was for some time secretary of the Berlin Academy. In 1848 he was sent to Paris as ambassador of the German parliament. He died on 14th June 1873. The first scientific historian to popularise history in German, Von Raumer wrote *Geschichte der Hohenstaufen* (6 vols. 1823–25), his best book, based on critical research, and agreeably written; *Geschichte Europas seit dem Ende des 15 Jahrhunderts* (8 vols. 1832–50); *Beiträge zur neueren Geschichte* (5 vols. 1836–39); and edited the useful *Historisches Taschenbuch* from 1830. In the years 1830–43 he made extensive journeys, going as far as the United States; the observations made during these trips were written in several books dealing with England (1835 and 1841), Italy (1840), the United States (1845), &c. See his *Lebenserinnerungen und Briefwechsel* (2 vols. 1861).

Raumer, Karl Georg von, geologist and geographer, a brother of the preceding, was born April 9, 1783, at Wörlitz, studied at Göttingen and Halle, and at the Mining Academy at Freiberg, was appointed professor of Mineralogy at Breslau in 1811, was translated in 1819 to Halle, and finally, in 1827, was appointed professor of Mineralogy and Natural History at Erlangen, where he died June 2, 1865. His most ambitious book was *Geschichte der Pädagogik* (1843–51; 5th ed. 1878–80), a portion of which was issued separately as *Die Erziehung der Mädchen* (4th ed. 1886). His most popular books were, after these, *Beschreibung der Erdoberfläche* (6th ed. 1866); *Palästina* (4th ed. 1860); and *Lehrbuch der allgemeinen Geographie* (1832; 3d ed. 1848). He also wrote books more immediately connected with his special study, as *Geognostische Fragmente* (1811), *Versuch eines ABC-Buchs der Kristallkunde* (1820–21), &c. See his Autobiography (Stuttg. 1866).—His son, Rudolf von Raumer (1815–76), from 1846 a professor at Erlangen, won a high reputation in the field of Teutonic philology.

Ravaillac, François (1578–1610), a bankrupt schoolmaster, who, after long imprisonment and a brief service in the Order of Feuillans, was moved by fanaticism to stab Henry IV. (q.v.) of France. He was torn asunder by horses. See Loiseleur, *Ravaillac et ses Complices* (1873).

Ravelin. See Fortification.

Raven (*Corvus corax*), a species of Crow (q.v.), now somewhat rare in Britain except in remote regions or on rocky islands. It is, however, widely distributed in Europe, northern Asia, and North

Raven (*Corvus corax*).

America. The plumage is glossy black, with a purplish-blue lustre on some parts. The bill and legs are also black. In length the raven measures about two feet. The males are rather larger and more lustrous than the females. Very early in the year the bulky nest is built on a cliff or tree; the three to five eggs are bluish-green, with brownish spots. The raven's note tends to be harsh, but is refined at the pairing season, and the bird may be trained to parrot-like imitation with remarkable success. The flight is powerful, and the bird often soars high. On small mammals, such as rats, the raven is fond of feeding, and its attacks on game and even lambs have led to its extermination in many districts. In Scandinavia the raven was sacred to Odin, but in many countries it is a bird of ill omen. Instances are on record of ravens which lived for four-score years, and there is no doubt that its natural longevity is great. Three varieties or sub-species of the raven are recognised in North America. See Crow; and R. W. Schufeldt, *The Myology of the Raven* (1890).

Ravenna, a city of Italy, 43 miles E. of Bologna, once close to, but now some 5 miles from the Adriatic, with which it is connected by the Corsini Canal, is enclosed by a wall 3 miles long, with five gates. It has been the seat of an archbishop since 438, and possesses a museum, a public library, a picture-gallery, municipal buildings (with a leaning tower), a theatre, &c. It has manufactures of silk, linen, paper, and glass, and a trade in wine and agricultural products. The streets are wide, and the squares are adorned with statues of the popes. The outward aspect of the

town and its buildings is dull and disappointing, but the interiors of the churches are exceedingly interesting. Pop. 12,100; of commune, 60,573.

Possibly a Thessalian settlement, afterwards held by the Umbrians, Ravenna passed to Rome as one of the cities of Cisalpine Gaul south of the Po. It first became famous under Augustus as the station of the Adriatic fleet, with Classis—a flourishing suburb—as its port, a site marked now only by a church, and separated from the sea by the pine forest celebrated by Dante, Boccaccio, Dryden, and Byron. Deserted by the sea, and strongly entrenched by canals and marshes, Ravenna became the refuge of the Emperor Honorius (402), and the capital of Italy for the next 350 years. Imperial until Romulus Augustulus doffed the purple at the bidding of Odoacer (see ITALY), who ruled at Ravenna 476–493, it attained its greatest glory under Theodoric the Ostrogoth (493–526), whose mausoleum (La Rotonda)—now empty—is without the walls. Conquered by the generals of Justinian, Ravenna was the seat of Exarchs (q.v.) from Constantinople until 752, when it was taken by the Lombards, and afterwards by the Franks, by whom it was gifted to the pope. A republic in the early part of the 13th century, governed by its own dukes in the 14th, subject to Venice after 1440, it was won by Pope Julius II. in 1509, and continued papal until it became national in 1860.

Ravenna, chiefly on account of its numerous ancient churches, holds a unique position as 'the Pompeii of the 5th and 6th centuries'—that marked transitional period in early mediæval history. There are at least six churches of the time of Galla Placidia (390–450), the sister of Honorius and mother of Valentinian III. SS. Nazario e Celso is her mausoleum, and there lie her brother, her second husband Constantius III., and her son. Theodoric, leaving, with rare religious toleration, the cathedral of St Urso (almost entirely rebuilt, 1734) and the other churches to the Catholics, erected for his Arian Goths the basilica of St Martin (now St Apollinare Nuovo, with its marvellous mosaic processions of martyrs added about 560, when it was 'reconciled') as a cathedral, a baptistery (now St Maria in Cosmedin), and St Teodoro (now St Spirito). St Vitale (with contemporary portraits in mosaic of the emperor and Theodora)—the model for Charlemagne's cathedral at Aix-la-Chapelle—and the magnificent basilica of St Apollinare in Classe belong to the age of Justinian. The *round* campaniles, perhaps of the 10th century, form another architectural feature peculiar to Ravenna.

Dante died at Ravenna, September 14, 1321, and is buried there. A column, 2 miles from the walls, commemorates the fall of Gaston de Foix at the head of the French army of Louis XII., after a bloody and useless victory over the papal and Spanish troops, April 11, 1512. Byron resided at Ravenna from June 1819 to October 1821.

Ravensburg, a town of Würtemberg, 11 miles by rail NE. of Friedrichshafen, on Lake Constance. Pop. 12,483.

Ravenscroft, THOMAS (1592–1640), musical composer and author of *Melismata* (1611), and of a collection of psalm-tunes for four voices, *The Whole Book of Psalms* (1621) by various composers. Some of the tunes, such as St Davids, Canterbury, Bangor, and many others, which have since become popular, are by Ravenscroft himself.

Ravenspur. See HUMBER.

Ravignan, GUSTAVE FRANÇOIS XAVIER DELACROIX DE, a celebrated Jesuit preacher, was born at Bayonne, December 2, 1795, was professor at Montrouge, and became famous in 1837 as preacher at Notre Dame in Paris. He died 26th February 1858. He published an Apology of his order in 1844, and in 1854 a more lengthened work with the same view, *Clement XIII. et Clement XIV.* See memoirs by Poujoulat (1858) and De Ponleroy (1860; Eng. trans. New York, 1873).

Ravinala. See TRAVELLER'S TREE.

Rawal Pindi, a town and important military station of the Punjab, lies between the rivers Indus and Jhelum, 160 miles by rail NW. of Lahore. Since the extension of the railway to Peshawar, and since the last Afghan war, the town has increased at a rapid rate. Pop. (1868) 28,586; (1881) 52,980; (1891) 73,460. There are an arsenal (1883), a fort, a fine public park, several European churches, including the garrison church, in which Bishop Milman of Calcutta, who died here, was buried (1876), and the headquarters of the Punjab Northern State Railway. The place carries on an active transit-trade with Cashmere and Afghanistan. Here the Sikhs surrendered after their defeat at Gujrat (1849), and here too was held, in 1885, a great durbar or review, at which the Ameer of Afghanistan met Earl Dufferin, Governor-general of India.—The *district* (area, 4861 sq. m.; pop. 820,512) contains many of the towns connected with the Indian campaign of Alexander the Great.—The *division* has an area of 15,435 sq. m. and a pop. of 2,520,508.

Rawitsch, a town of Prussia, 64 miles by rail S. of Posen. Pop. 12,919.

Rawlinson, SIR HENRY CRESWICKE, Bart., orientalist and diplomatist, was born at Chadlington in Oxfordshire, 11th April 1810, and entered the East India Company's army in 1827. In 1833 he proceeded to Persia to assist in organising the Persian army. During the six years he spent in that country he began to study the cuneiform inscriptions, and made a translation of Darius' famous Behistun inscription, which he published in the *Journal of the Royal Asiatic Society.* After he left Persia he held command of Kandahar during the troublous times of 1840–42 (see AFGHANISTAN); he was appointed political agent at Bagdad in 1844, and consul-general there in 1851. He showed great bravery in the field, and remarkable skill and resource in diplomacy. In 1856, now made K.C.B., he was appointed director of the East India Company. In 1858–59 he was again in Persia as British minister; and was successively member (1868) and vice-president (1876) of the Council of India. In 1865–68 he sat in parliament for Frome. He held the presidency of the Royal Geographical Society (1871), to whose *Proceedings* he contributed valuable papers, a trusteeship of the British Museum (1879), and a directorship of the Royal Asiatic Society. He was made a baronet in 1891; and he died 5th March 1895. The 'father of Assyriology,' he wrote *A Commentary on the Cuneiform Inscriptions of Babylon and Assyria* (1850), *Outline of the History of Assyria* (1852), *The Cuneiform Inscriptions of Western Asia* (with Norris and George Smith, 5 vols. 1861–70), and *England and Russia* (2d ed. 1875). See the Life by his brother (1898).

That brother, GEORGE RAWLINSON, orientalist and historian, was born at Chadlington in Oxfordshire in 1812, took a first-class in classics from Trinity College, Oxford, in 1838, and was elected a Fellow of Exeter College in 1840. In 1859 he preached as Bampton Lecturer on *Historical Evidences of the Truth of the Scripture Records,* and two years later was chosen Camden professor of Ancient History. In 1872 he was made a canon of Canterbury. His historical publications cover nearly the entire history of the ancient Orient. The series opens with the standard edition of Herodotus (4 vols. 1858–60; 3d ed. 1876), which was

followed by *The Five Great Monarchies of the Ancient Eastern World* (4 vols. 1862–67), *The Sixth Great Oriental Monarchy of Parthia* (1873), *The Seventh or Sassanian Empire* (1876), *History of Ancient Egypt* (1881), and *History of Phœnicia* (1889). The same ground is also covered in part in the smaller popular works, *Egypt and Babylon from Scripture and Profane Sources* (1884), *Manual of Ancient History* (1869), *Religions of the Ancient World* (1882), &c. Besides these, he has written several books of biblical exposition and religious criticism, as *Contrasts of Christianity with the Heathen and Jewish Systems* (1861), a series of sermons preached before the university of Oxford; Esther, Ezra, Nehemiah, &c., for The Speaker's Commentary; Exodus with a commentary (1882–85); *Moses, his Life and Times* (1887); *Kings of Israel and Judah* (1889); *Isaac and Jacob* (1890); brief essays contributed to *Present Day Tracts;* and the article PHŒNICIA in the present work.

Rawmarsh, a town in the West Riding of Yorkshire, 2¼ miles N. by E. of Rotherham, with china and iron works, and neighbouring collieries. Pop. (1851) 2533; (1891) 11,983.

Ray, a popular name applied to many of the flat cartilaginous fishes or Elasmobranchs. Skate (*Raia batis*), Thornbacks (*R. clavata*), Electric Rays (Torpedo), Sting-rays (e.g. Trygon), Eagle-rays (e.g. Myliobatis) are representative. They lead a somewhat sedentary life at the bottom of the sea, moving sluggishly by undulations of the pectoral fins which form a large part of the flat body. They are all carnivorous. The true rays, of which skate and thornback are typical and very common species, form the family Raiidæ. Many attain a large size, sometimes measuring six feet across. The flesh is edible, but strongly flavoured and not very highly esteemed. See CARTILAGINOUS FISHES, DEVIL-FISH, ELECTRIC FISHES, SKATE.

Ray, or WRAY, JOHN, naturalist, was born at Black-Notley, near Braintree, in Essex, 29th November 1628. From Braintree free-school he went up to Cambridge, where he was fellow, Greek lecturer, mathematical tutor, and junior dean in Trinity College, but after a time began to devote himself entirely to the study of natural history. At the Restoration he accepted Episcopal ordination, but was ejected by the 'Black Bartholomew' (1662). Thereupon, accompanied by a kindred spirit, Francis Willughby, a friend and former pupil of his own, Ray travelled over most of the United Kingdom, collecting and investigating botanical and zoological specimens; and in 1663 they started on a tour through the Low Countries, Germany, Italy, and France, with a similar object, Willughby taking the zoology under his charge, and Ray the botany. In 1667 Ray was elected a Fellow of the Royal Society, to whose *Transactions* he occasionally contributed valuable papers. In 1672 his friend Willughby died, leaving him guardian to his two sons. After several changes of residence, in 1679 Ray settled down in his native village, where he died, 17th January 1705. As a botanist and zoologist he ranks very high, the classification of plants which he proposed being practically in the main the foundation of what is now known as the 'Natural System' of classification (see BOTANY). Ray's zoological works are considered by Cuvier as the foundation of modern zoology. The chief of his works on botany are *Methodus Plantarum Nova* (1682); *Catalogus Plantarum Angliæ* (1670), the basis of all the subsequent floras of Britain; and *Historia Plantarum* (3 vols. 1686–1704). His zoological works include the *Synopsis Methodica Animalium* (1693) and three posthumous volumes on Birds, Fishes, and Insects, published by Dr Derham. He was also the author of some theological works. His friend Willughby, having collected the materials for an extensive work on the animal kingdom, left to Ray the task of arranging and classifying them (see WILLUGHBY). See *Memorials of Ray* (1846), and his *Correspondence* (1848), both edited by Dr E. Lankester for the Ray Society, which was founded in 1844.

Rayahs, the Christian peasantry, labourers, and small farmers, who lived under Turkish rule, or rather misrule, in the Balkan peninsula. The word means 'cattle,' and as cattle these people were treated by their Turkish masters in Bosnia, Servia, Bulgaria, and the neighbouring states.

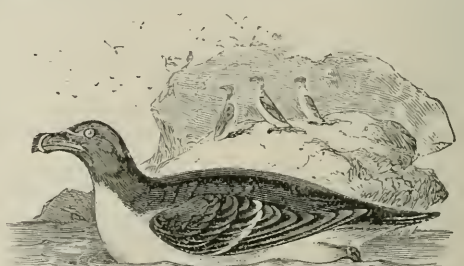
Rayleigh, LORD, physicist. John-William Strutt, third Baron Rayleigh, was born 12th November 1842, studied at Trinity College, Cambridge, and was the senior wrangler (1865), Smith's prizeman, and fellow of his college (1866). He was professor of Experimental Physics at Cambridge from 1879 to 1884; in 1888 succeeded Tyndall as professor of Natural Philosophy at the Royal Institution; and is D.C.L., LL.D., and F.R.S. He has contributed much to the scientific periodicals, edited Clerk-Maxwell's *Heat*, and is author of *The Theory of Sound* (1877–78). In 1894, with Professor Ramsay, he separated from atmospheric nitrogen the new gas argon—hitherto undetected, but constituting about 1 per cent. of the atmosphere.

Raynouard, FRANÇOIS JUSTE MARIE, poet and philologist, was born at Brignolles, 18th September 1761, studied at Aix, and in 1791, an advocate and a deputy, joined the Girondins, and was for a time imprisoned. His poems and tragedies were successful, and in 1807 he was elected to the Academy, of which he became perpetual secretary in 1817. A member of the imperial legislative body from 1806, he continued to produce dramas, but towards the fall of the Empire turned his attention to linguistic and particularly Provençal studies. His researches into the origin and transformations of this tongue led to many valuable discoveries, though his theories as to the relation of the language of the troubadours to the other Romance tongues are not now accepted. Raynouard died at Passy, near Paris, 27th October 1836.

His chief writings are *Eléments de la Grammaire Romane* (1816); *Choix de Poésies Originales des Troubadours* (6 vols. 1816–21); *Grammaire comparée des Langues de l'Europe Latine dans leur Rapports avec la Langue des Troubadours* (1821); and *Lexique Roman, ou Dictionnaire de la Langue des Troubadours* (6 vols. 1838–44).

Razor. See BEARD, CUTLERY.

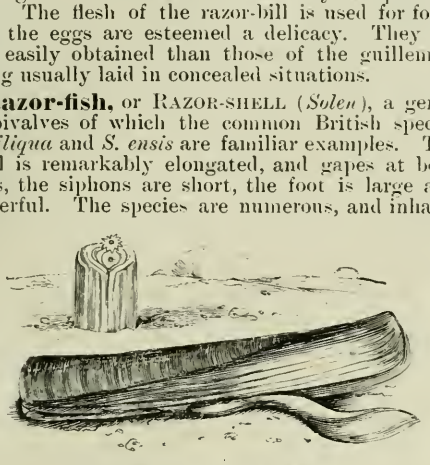
Razor-bill, or RAZOR-BILLED AUK (*Alca torda*), a species of Auk (q.v.), very common on



Razor-bill (*Alca torda*).

the coasts of Britain and of all the northern parts of the Atlantic Ocean. In March and April they congregate in great numbers on cliffs and islands for the breeding season. A single egg, measuring about 3 inches in length, and of a white or light brown colour streaked with dark brown, is laid in a crevice or under a ledge of rock. The male helps to sit on the eggs. The razor-bill measures about 17 inches. The plumage is of a glossy greenish black on the upper parts and dazzling white underneath. It is a handsomer bird than the Guillemot (q.v.), and can be readily distinguished from it at a distance by its upturned tail. The flesh of the razor-bill is used for food, and the eggs are esteemed a delicacy. They are less easily obtained than those of the guillemot, being usually laid in concealed situations.

Razor-fish, or RAZOR-SHELL (*Solen*), a genus of bivalves of which the common British species *S. siliqua* and *S. ensis* are familiar examples. The shell is remarkably elongated, and gapes at both ends, the siphons are short, the foot is large and powerful. The species are numerous, and inhabit



Razor or Solen-fish (*Solen siliqua*).

the sands of all seas except in the coldest parts of the world. Some of the tropical species have shells of great beauty. The solens burrow in sand, making vertical holes 2 or 3 feet in depth, and ascending and descending by means of their foot, which is capable of being elongated and contracted to bore a passage for the animal, and to drag it through. They are used for food, and also by fishermen for bait. To obtain them, a hooked iron implement is used. Another method is to drop a quantity of salt on the mouth of the hole, which causes them to come up, when they are quickly seized.

Ré, ÎLE DE (*Rex insula*), is a small, low-lying island off the coast of the French department of Charente-Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton. It is about 18 miles long and 3 broad, measures 28 sq. m., and has (1886) 15,557 inhabitants, who are chiefly engaged in the preparation of salt (32,000 tons annually). The west coast is rocky; on the east side there are some good harbours. Oyster-farming has of late become an important branch of industry (35,000,000 annually). Wine is made and exported. The chief town, St Martin (pop. 2788), was fortified by Vauban. Ars and La Flotte have each about 2000 inhabitants.

Reade, CHARLES, novelist and playwright, was born at Ipsden House on 8th June 1814. The youngest of eleven, he came on both sides of good lineage, his father an Oxfordshire squire, his mother a clever Evangelical; from her he 'inherited his dramatic instinct.' After five years (all flogging) at Iffley, and six under two other and milder private tutors, in 1831 he gained a demyship at Magdalen College, Oxford, and in 1835, having taken a third class in honours, was duly elected to a lay fellowship. Next year he entered at Lincoln's Inn, and in 1843 was called to the bar, meanwhile having made the first of many tours abroad and at home, and developed a craze for trading in violins. 'I studied,' he tells us, 'the great art of Fiction for fifteen years before I presumed to write a line of it;' and it was not till 1850 that he put pen seriously to paper, 'writing first for the stage about thirteen dramas, which nobody would play.' Through one of these dramas, however, he formed his platonic friendship with Mrs Seymour, a warm-hearted actress, who from 1854 till her death in 1879 kept house for him. She animated, counselled, guided him; and, apart from his quarrels and lawsuits (which were many), his life after 1852 is little except a record of the production of plays and novels, by the former of which he generally lost money, by the latter won profit and fame. The plays include *Masks and Faces* (1852), written in conjunction with Tom Taylor, and having Peg Woffington for its leading character; *Gold* (1853), the germ, and *Sera Nunquam* (1865), the dramatised form, of *Never too Late;* and *Drink* (1879), an adaptation of Zola's *L'Assommoir*. Of his eighteen novels may be mentioned *Peg Woffington* (1853); *Christie Johnstone* (1853), the Newhaven fisher lass; *It is Never too Late to Mend* (1856), a tale of prison abuses and life in Australia; *The Cloister and the Hearth* (1861), its hero Erasmus' father, condemned, like Reade himself, to celibacy; *Hard Cash* (1863), against private lunatic asylums; *Griffith Gaunt, or Jealousy* (1866); *Foul Play* (1869), in conjunction with Dion Boucicault, against ship-knackers; *Put Yourself in his Place* (1870), against trades-unions; *A Terrible Temptation* (1871); and *A Woman-hater* (1877), for woman's rights. His last years clouded by sorrow and ill-health, he died at Shepherd's Bush on Good Friday, 11th April 1884, and was buried in Willesden churchyard beside his 'beloved friend.'

Charles Reade was not one of the greatest novelists of the century (who number three, at most four); but of the second order he is perhaps the best. He is sometimes coarse, theatrical sometimes rather than dramatic, and sometimes even dull, weighed down with authorities—the blue-books, books of travel, and the like, with which he fettered his imagination. With the greatest novelists one is conscious only of the story, with him one is always conscious of the story-teller: some tone or mannerism from time to time jars upon us. And yet what a story-teller it is. How he carries us with him, stirs us, saddens, gladdens, terrifies, delights. No novels are better than his to read aloud. For they hold the listeners spell-bound, and 'Bravo!' or oftener just a long-drawn 'Oh!' attests Reade's magnificent powers far better than can all the fine-spun criticisms in which A. concedes and B. denies him the gifts of humour and pathos; in which M. declares that 'Reade invented the True Woman,' and N. that 'of the woman who is essentially of our time he has never had even the faintest conception;' in which X. discovers 'in the short *Wandering Heir* at least half a dozen situations all new and all strong,' and Y. pronounces it 'very decidedly the worst of Reade's shorter stories.' These things need not perplex us, the simple admirers of *Griffith Gaunt*, of the fight with the pirates, of the bursting of the reservoir, and of the scenes at the gold-diggings. At the same time we may rejoice in the unanimous verdict that is passed by the critics on *The Cloister and the Hearth*. It Mr Swinburne—from whom praise is praise indeed—places 'among the very greatest masterpieces of narrative. Its tender truthfulness of sympathy, its ardour and depth of feeling, the constant sweetness of its humour, the frequent passion of its pathos, are qualities in which no other tale of adventure so stirring and incident so inexhaustible can pretend to a

moment's comparison with it—unless we are foolish enough to risk a reference to the name by which no contemporary name can hope to stand higher or shine brighter, for prose or for verse, than does that of Shakespeare's greatest contemporary by the name of Shakespeare.'

Charles Reade: A Memoir (2 vols. 1887), by his brother and a nephew, is a most unhappy piece of biography. The *Gentleman's Magazine* for 1882 contains two articles by Sir W. Besant and 'Ouida;' and in his *Miscellanies* (1886) is Mr Swinburne's article from the *Nineteenth Century*. *Readiana* (1882) is a collection of the novelist's fragments; and *Extracts* from his works, with an introduction by Mrs Ireland, appeared in 1891.

Reader. See LAY-READER.

Reading, a municipal, parliamentary, and county borough, the capital of Berkshire, on the Kennet, near its influx to the Thames, 36 miles by rail W. of London (by road 39, by river 74). Its strong castle was wholly demolished by Henry II.; and the splendid Benedictine abbey, founded in 1121 by Henry I., who was buried here, is represented by considerable ruins and a fine gateway, restored in 1861, and surrounded by public gardens. Nine parliaments were held within its hall; and the last of its mitred abbots was hanged by Henry VIII., with two of the brethren. There are handsome municipal buildings and two excellent town-halls, a lofty clock-tower, a free library, concert-room, museum, &c. Other buildings are the Italian assize courts (1861); a large grammar-school (1486; rebuilt 1870–71), of which Dr Valpy was long headmaster; St Lawrence's Church (1434; restored 1868); and the Royal Berkshire Hospital. University Extension (Oxford) College, opened in 1898, has accommodation for six hundred students; and the largest (59 acres) of three public parks was gifted in 1891 by Mr G. Palmer. Reading is an important mart for corn and other agricultural produce, and has manufactures of iron, paper, sauce, &c., whilst two of its industrial establishments are world-famous—Huntley and Palmer's huge biscuit-factory and Sutton's seed-emporium. Reading, which is in the diocese of Oxford, gives title to a suffragan bishop. Its representation was reduced from two to one in 1885, when, however, the parliamentary borough was extended. The first charter was granted by Edward III. Pop. (1851) 21,456; (1881) 46,054; (1891) 55,752; county borough (1891) 60,054. Reading suffered much from the Danes between 868 and 1006, and in 1643 surrendered to Essex after a ten days' siege. It was the birthplace of Archbishop Laud, Justice Talfourd, and Goldwin Smith, but not of Miss Edgeworth, who is often claimed as a native. It has memories also of Chaucer and Bunyan.

See works by Coates (1802–9), Man (1816), Doran (1835), and J. B. Jones (1870).

Reading, a city of Pennsylvania, capital of Berks county, on the left bank of the Schuylkill River, 58 miles by rail NW. of Philadelphia. It is pleasantly situated on an ascending plain, and from the neighbouring hills draws its water-supply and abundant iron ore. The principal manufactories of Reading are its iron and steel works. These include many rolling-mills, forges, foundries, furnaces, machine-shops, nail-works, &c. It has also manufactories of shoes, hats, beer, cigars, leather, paper, bricks, &c. Settled in 1748, it became a city in 1847, and is the seat of an Episcopal bishop. Very many of the inhabitants are of German descent, and half the newspapers are in that language. Pop. (1880) 43,278; (1890) 58,661.

Reading, a town of Massachusetts, 12 miles by rail N. by W. of Boston, with boot and shoe and furniture factories. Pop. 4081.

Reagents. See BACTERIA, Vol. I. p. 649.

Real, a silver coin and money of account in Spain, Mexico, and other old Spanish possessions, is the $\frac{1}{20}$th part of the piastre, or $\frac{1}{4}$th of the *peseta*, the franc of the new Spanish decimal system, and has a value, varying with the exchange, of about 2½d. The real was first coined in Spain in 1497. It is also a money of account in Portugal, being the equivalent of 40 reis. In Java it is the name of a weight for gold and silver articles, corresponding to 17 dwt. 14 gr. troy weight.

Real is a term used by lawyers to describe the nature of certain rights and actions. The rights of an owner of property are real rights—i.e. he has a right to claim some specific thing and hold it against all other persons. Contractual rights, on the other hand, are personal—i.e. they are good only against the person who is bound to perform the contract. Forms of action are classified according to the nature of the right which is in dispute. The Roman law gave an action *in rem* for the recovery of any thing, whether movable or immovable, which was withheld from the person entitled; an action *in personam* was the form in which compensation could be obtained for breach of contract or other wrongful act. In Scotland, and in other countries where the Roman law has been studied and followed, real rights and real actions are defined very much as they were defined by the civilians; England has taken a course of its own. At the time when the common law was taking shape land was of primary importance. The owner of chattels (movable things) was entitled to damages if his property was detained from him or converted to the use of another; but he had no real action to recover the thing itself. A real action was an action to recover land or some right connected with land. Some interests in land (e.g. the interest of a tenant under a lease) were regarded as personal rights against the owner; in technical language the interest of a tenant for years is a chattel real, or a chattel which savours of the realty. The English law of property frames all its rules with reference to these somewhat arbitrary distinctions. Thus, for example, on the death of an owner his real property passes at once to his heir or to the devisee named in his will; his personal property (including his chattels real) passes to his executor or administrator for distribution among the persons named in his will or the next-of-kin. Real property was formerly favoured in some points by the law, but modern legislation has made property of all kinds equally accessible to creditors, and the rules which apply to land have been considerably simplified and improved.

Realgar. See ARSENIC.

Realism in philosophy is diametrically opposed to Nominalism (q.v.), as involving the belief that genus and species are *real* things, existing independently of our conceptions and their expression, and that these are alike actually the object of our thoughts when we make use of the terms. Again, as opposed to Idealism, the word implies an intuitive cognition of the external object, instead of merely a mediate and representative knowledge of it.

In art and literature the word Realism or Naturalism is employed to describe a method of representation without idealisation, which in our day in France has been raised to a system and claims a monopoly of truth in its artistic treatment of the facts of nature and life. It claims that the enthusiasms and exaggerations of romanticism must give place to a period of reflection and criticism; that we must not select from the facts put before our eyes, but merely register them and the sensations they engender for themselves alone, apart

from all considerations of mere beauty, to say nothing of religion or morality; and that the experimental romance must hereafter follow the rigid methods of science, in being based alone on 'human documents' supplied from the close observation of the present, or from laborious erudition—the retrospective observation of the past. As a gospel this militant Realism is the offspring of the Positive philosophy and the physiology and psychology of the age; and in effect, in the hands of its apostles, it has become a new morality which reforms not by precept but example, not by the attraction of the good, but by the repulsion of the evil. The practical result is that for French realists there is in the moral world only the evil, in the visible world only the ugly, and the triumphs of our modern fiction are the pitiless impersonality of *Madame Bovary*, the cold splendours of *Salammbô*, the brutal vulgarities of Zola, the refined sensualism of Bourget and Guy de Maupassant, the pretentious inanities of the Goncourt brothers, and the dreary pessimism of Dostoievsky and Tolstoi. If realism were perfect it would include all reality, order as well as disorder, the general as well as the particular, the lofty as well as the low. For there are men and women who are neither selfish nor drunken, nor lecherous; your experimental cesspool is not Paris, your Paris is not the universe; your hospital-wards may contain cases of all moral maladies, but you forget the moving world of health and life outside its walls; your vaunted collection lacks one specimen, not the rarest, and certainly the most beautiful. For the dream is as true a leaf of life as the sober vision, and idealism is the permanent revenge of man over the inequalities of life—the protest of creative mind against external fatality. Idealistic art seizes life at its richest moments, and presents it preserved for ever by its immaterial essence from inconstancy and degradation. This so-called realism is not reality—the steps of true art must ever be elimination and generalisation; its postulates, the eternal conventions of form, style, language, and subject, necessary because they are elemental.

Real Presence. See LORD'S SUPPER, TRANSUBSTANTIATION.

Real-schulen. See EDUCATION, Vol. IV. p. 208.

Reaping, the act of cutting corn, was from time immemorial until far through the 19th century performed with an instrument called a reaping-hook or sickle. The sickles in use among the ancient Jews, Egyptians, and Chinese appear to have differed very little in form from those employed in Great Britain. The reaping-hook is a curved instrument of about a foot and a half in length, tapering from a breadth of about two inches at the butt-end, where it is fixed into a wooden handle. The edge is sometimes serrated; but, as a rule, it has long been made plain and sharp like a knife. In many parts of the British Isles it was supplanted by the scythe in the earlier half of the 19th century. In other parts it lived until the modern reaping-machine was ready to take the place of it as well as of the scythe. The sickle or hook did its work admirably, but it was necessarily slow. On small farms in some districts it is still employed; and occasionally on large farms, when the crop is much laid and twisted, it is resorted to. By the scythe corn can be cut at a rather less cost per acre than with the hook; but the work is not always so neatly done. As nice a stubble will be left by a good hand with the scythe, and often nicer than by the hook, but the sheaves are not, as a rule, so tidy after the scythe, though they will stack rather earlier. Of a fair working crop an adept at the scythe would cut 2 or 2¼ acres per diem. The average, however, would not exceed 1½ acres. In fact, if the crop is heavy, that extent is a very hard day's work.

An attempt to trace the history of the reaping-machine would carry us far back into the earlier stages of agriculture. Pliny the Elder, who was born early in the 1st century of the Christian era, found a reaping-machine in Gaul. He says: 'In the extensive fields in the lowlands of Gaul vans of large size, with projecting teeth on the edge, are driven on two wheels through the standing corn by an ox yoked in a reverse position. In this manner the ears are torn off, and fall into the van.' Palladius, about four centuries later, found a similar appliance for reaping corn in Gaul. He gives a more detailed but similar description of the

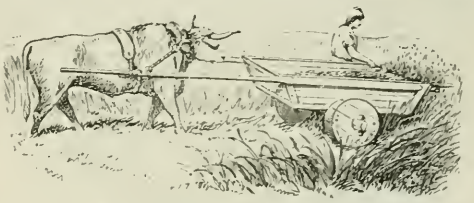

Fig. 1.—Ancient Reaping-machine.

machine. Fig. 1, copied from Mr Woodcroft's *Appendix to the Specifications of English Patents for Reaping-machines*, represents what is conceived, from the descriptions, to have been the form of this ancient reaper.

In modern times the idea of a mechanical reaper appears to have originated with Capel Lofft (q.v.), who in 1785 suggested a machine something after the pattern of the ancient one described above. Between that time and the Great Exhibition of 1851 in London, from which the general use of mechanical reapers may be said to date, the patents taken out for reaping-machines were very numerous. Among the most promising of these may be mentioned those of Mr Gladstone of Castle-Douglas; Mr Smith of Deanston; Mr Kerr, Edinburgh; Mr Scott of Ormiston; Mr Dobbs, an actor in Birmingham; Mr Mann of Raby, near Wigton; and the Rev. Patrick Bell of Carmylie, Forfarshire. In 1826 Mr Bell constructed an efficient and simple machine, which long continued in use, and several features of which are observable in the reapers of the present day. The inventor of this, the first machine of the kind in Scotland, received a public testimonial from agriculturists, in consideration of the services he thus rendered to agriculture. In America Mr Hussey and Mr M'Cormick took out patents for reaping-machines of superior character in 1833 and 1834 respectively. The movements of the cutters of these machines were various. A few were advancing only, some sidelong and advancing, others reciprocating and advancing, a large number continuous and advancing, and others continuous and alternate. The reciprocating and advancing motion is that now employed on the machines in use.

The principal difference in the machines now so largely used for cutting corn is in the form and character of the cutters, and in the mode of delivering the grain after it is cut.

The cutting-knives are of two kinds—one, obtuse-angled and serrated; the other, acute-angled and for the most part plain. Both are attached to a bar, and are made to work through another bar of iron fitted with hollow fingers, called guard-fingers, which, projecting forwards, catch the standing corn, and retain it firmly until it is cut. The serrated knife saws through it, the plain knife clips it, as it were, the finger-guard forming the fixed blade of the scissors.

The delivery of the sheaves divides the machines into three kinds—(1) those delivered by manual labour; (2) those delivered by mechanical labour, or self-deliverers; and (3) combined reapers and binders, which deliver the sheaves ready bound. The delivery of the sheaves by manual labour is now chiefly at the back of the machine, the side-delivery being generally abandoned, unless in the self-deliveries. In delivering the grain, a man, with a short-handled rake in his hand, sits upon the machine almost opposite the cutting apparatus. With this he inclines the grain towards the knife; and, when sufficient has been cut to make a sheaf, he rakes it off the platform of the machine, on to which it has fallen, and deposits it on the ground. With the back-delivery the sheaves must be tied up and removed out of the way of the machine before it comes

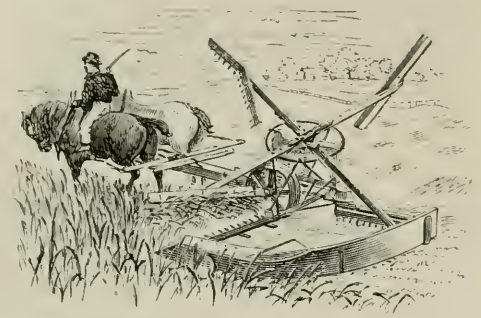

Fig. 2.—Samuelson's Self-delivery Reaping-machine.

round again. Such a reaper, therefore, always requires a full supply of hands to attend upon it. Carefully handled, this machine will take up laid and twisted crops admirably. Its cost ranges from £18 to £25.

The mechanical or self-delivery machines, as they are generally called, are of two kinds—one lays the cut corn in swathes, the other deposits it in sheaves. Samuelson's sheaf-deliverer will be made plain by fig. 2. The machinery consists of a series of four rakes—two toothed and two plain—attached to an upright shaft in such a manner as to admit of a free ascending, descending, and horizontal motion. The two toothless rakes or 'dummies' are shorter in the arms by six inches than the other two, and are merely employed to incline the grain towards the cutter. By an ingenious eccentric motion, the rakes are made to sweep the sheaves off the platform at intervals of about 12 feet apart, to the side, and out of the way of the horses. The self-deliverer costs from £25 to £30.

The more recent automatic combined reaper and binder promises to supersede entirely all other reaping-machines. The general appearance and arrangement of Howard's light steel-frame sheaf-binder is shown in fig. 3. The cutting portion of the binder is very similar to that of an ordinary reaping-machine. The cut grain as it falls back on the machine is conveyed by an endless web over the top of the driving-wheel to the knotter. Here it falls into two arms called compressor jaws. These retain it on the knotter table till a sheaf of the prescribed size has accumulated. 'Whenever a sheaf of the desired size has been delivered to the compressors, these relieve the tripper, which sets in motion the needle (carrying the binding twine) and the knotting apparatus. The needle is circular, and in its course it passes the band (twine) round the sheaf, when the band is caught by the knotter, and almost instantaneously a firm and secure knot is tied, while the needle is drawn back ready to operate on a new sheaf. As soon as the knot is tied and the string cut, the sheaf is ejected from the machine in a horizontal position, dropping gently on the ground on its side quite clear of the machine' (*Book of the Farm*). With a moderate crop of standing grain the binder in its various improved forms does its work in a most admirable manner, though when the crop is badly 'laid' it cannot be used satisfactorily. It is expeditious, and surpasses all other methods in neatness and thoroughness of work. When the binder was first introduced wire was the binding material. There were strong objections to its use, however, and it was not until twine was substituted that the invention made any headway. There are now several British firms engaged in making binders, which are gaining in popularity year by year. A binder costs about £50.

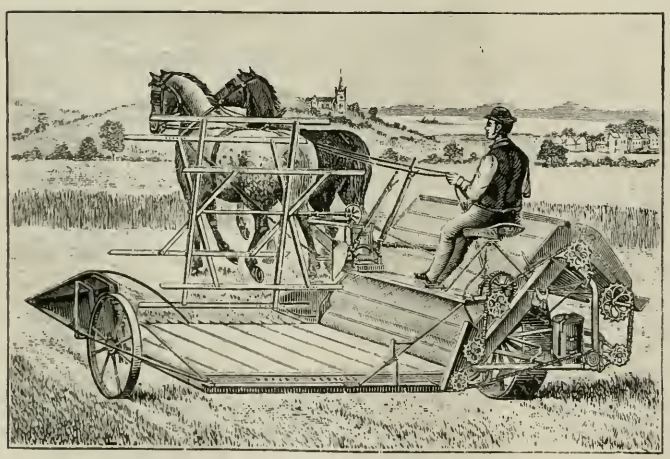

Fig. 3.—Howard's Binder.

See Woodcroft's *Appendix to Patents for Reaping-machines;* Mr Jacob Wilson's 'Essay on Reaping-machines,' in *Transactions of Highland Society* for January 1864; *Book of Farm Implements* and *Book of the Farm*, by Henry Stephens; J. C. Morton's *Cyclopædia of Agriculture*.

Reason. See the articles in this work on Psychology, Logic, Induction, Syllogism, Kant, Philosophy, and works cited under these.

Réaumur, Rene Antoine Ferchault de, physicist, was born at La Rochelle, 28th February 1683, and studied in the Jesuits' College at Poitiers, and afterwards at Bourges. In 1703 he went to Paris, where he attracted general attention by the publication of three geometrical Memoirs; and in 1708 he was elected a member of the Academy of Sciences, and was charged with the supervision of the work *Description des Divers Arts et Metiers*, published under the auspices of the government. Réaumur lightened his labours with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, auriferous rivers, and turquoise mines of France. The collections of Memoirs of the Academy of Sciences from 1722 till 1725 contain a number of papers by Réaumur,

in which he details his discoveries of the mode of producing steel from iron, and of the mode of tinning iron. For these and other researches he received from the French government a sum of 12,000 livres, which he spent in promoting and encouraging the industrial arts in his native country. In 1739 he succeeded in producing an opaque glass which was equal to the porcelain of Saxony and Japan. His invention of the Thermometer (q.v.) which bears his name need not be more than mentioned here. He died of a fall from a horse, 17th October 1757, leaving behind him a voluminous collection of works on all the subjects above stated, also a treatise on 'the silk of spiders,' a number of Memoirs (1731–40), containing his thermometric researches on air, and on mixtures of fluids with fluids or solids, and his *Mémoires pour servir à l'Histoire des Insectes* (Amsterdam, 12 vols. 1737–48).

Rebec (Arabic *rebab*), an ancient musical instrument of the violin kind, of which the body, instead of consisting of two hemispherical enlargements, like other instruments of the same tribe, was narrow towards the neck, and gradually enlarged till it rounded off at the lower end. Milton, in his *L'Allegro*, characterises this instrument as the 'jocund rebec.'

Rebecca Riots. a series of popular outbreaks which originated in Carmarthenshire in 1843–44, and quickly spread over Pembroke, Cardigan, and Brecon. They grew out of the impatience of the people at the great increase of toll-gates on public roads, and owed their singular name to their adopting as a motto Genesis, xxiv. 60. Bands of men five hundred strong, their leaders disguised in women's clothes, scoured the country by night, threw down the toll-bars, and then dispersed. A strong force of soldiers was poured into the country, but the rioters offered an obstinate resistance, and were not put down without great difficulty and considerable bloodshed. The commission appointed by government to inquire into the causes of the outbreak found that it grew out of a genuine public grievance, whereupon measures of relief were introduced, and those rioters seized were punished lightly.

Rebellion. 'The Great Rebellion' generally means the revolt of the Long Parliament against the authority of Charles I. (q.v.). See also CROMWELL, FALKLAND, HAMPDEN, &c.; ENGLAND (p. 352); and the works of S. R. Gardiner. The revolts on behalf of the House of Stuart in 1715 and 1745 are often, particularly in Scotland, spoken of emphatically as 'The Rebellion' (see JACOBITES). The term is applied in the United States to the secession of the southern states.

Rebus. an enigmatical representation of a name or thing by using pictorial devices for letters, syllables, or parts of words. The term probably originates from the device speaking to the beholder *non verbis sed rebus*. Devices of this kind, allusive to the bearer's name, were exceedingly common in the middle ages, particularly in England. In many instances they were used by ecclesiastics and others who had not a right to armorial ensigns. See BADGE.

Récamier. MADAME (*née* JEANNE FRANÇOISE JULIE ADÉLAIDE BERNARD), a famous Frenchwoman, was born at Lyons, 4th December 1777. She grew up a girl of remarkable grace and beauty, and at fifteen she was married to M. Jacques Récamier, a rich banker about thrice her own age. Her salon was soon filled with the brightest wits of the literary and political circles of the day, but fortunately for herself Madame Récamier possessed a temperament that saved her from temptation and almost scandal. For Madame de Staël she had a warm affection that survived the exile required by the jealousy of Napoleon. Soon after this her husband was completely ruined, and Madame Récamier visited Madame de Staël at Coppet in Switzerland (1806). Here she met Prince August of Prussia, who alone of all her innumerable admirers is supposed to have touched her heart. Indeed a marriage was arranged, provided M. Récamier would consent to a divorce. The good man did not refuse, but his kindness was too much for the generous heart of Madame Récamier, who declared she could not leave him in his adversity. The most distinguished friend of her later years was M. de Chateaubriand. In 1846 he became a widower, and he then wished to marry Madame Récamier, whose husband had been dead since 1830, but the lady declined the honour without interrupting the current of their friendship. Chateaubriand died 4th July 1848, and she followed him to the grave on 11th May 1849.

See *Souvenirs et Correspondance tirés des Papiers de Madame Récamier*, edited by her niece, Madame Lenormant (1859), and *Madame Récamier*, by the same (1872); also the biography by Brunier (1875), and the *Letters* of Benjamin Constant to her, at length published in 1881.

Recanati. a town of Italy, 15 miles S. of Ancona, has a Gothic cathedral with a monument to Pope Gregory XII. Here Leopardi was born. Pop. 5824. Porto Recanati, 6 miles NE. on the Adriatic coast, has a pop. of 3040.

Receipt is the technical as well as popular term signifying a legal acknowledgment of money received in discharge of a debt or demand. In England it is often believed that a written receipt is the only legal proof of payment: the fact being that it is only one mode of proving it. If the money be paid in presence of witnesses, or even without witnesses, provided a jury or judge believe the statement on oath of the party paying it, this is in England quite as good evidence of the payment as if a written receipt were given; and even a written receipt is conclusive only where it is under seal, or endorsed on a conveyance under the Conveyancing Act of 1881, unless the purchaser had notice to the contrary, or on a marine policy between assured and underwriter. In other cases a receipt is only *primâ facie* evidence, and may be explained. If a receipt is in writing and the sum paid exceeds 40s. it must be stamped with a penny receipt-stamp (which may be an adhesive stamp), to be cancelled before delivery, otherwise the receipt is inadmissible as evidence of payment; but on payment of certain penalties the receipt may be after-stamped with an impressed stamp. Not only is a receipt proper subject to stamp-duty, but also any note or memorandum given to a person on payment of money, and acknowledging payment of any part of a debt or demand, whether signed or not; so receipts given on payment of bills of exchange or promissory-notes are liable to stamp-duty. But a mere acknowledgment of indebtedness, as a receipt 'on loan,' or an I O U, is not stampable as a receipt. There are several exceptions from liability to stamp-duty. Such are receipts for deposits with bankers to be accounted for; receipts for any parliamentary taxes or duties, or for any payment to the Sovereign; receipts by officers, seamen, marines, or soldiers for wages or pay; receipts for purchase of government stock or for money due under Exchequer Bill; receipts written on any bill or note of the Bank of England or of Ireland, on the back of duly stamped bills of exchange or promissory-notes, or upon the back of duly stamped instruments acknowledging the receipt of money; and generally receipts to or by government departments. At one time, under the Act of 1803, it was supposed to be the duty of the debtor to provide stamped paper for a receipt, the

creditor being liable in a penalty of £10 if he refused to sign. This act, however, is repealed, and the better view is that when the debtor tenders payment the creditor is bound to give a proper discharge, the form of the discharge being regulated by custom. In Scotland the receipt of money cannot be proved by witnesses where the debt was created by writing, and it is not allowed to dispute the validity of a written receipt except in cases of fraud. It is only in the case of ready-money sales that receipt of the price can be proved by parole. See Tilsley's *Stamp Laws* (3d ed. 1871).

Receiving Stolen Goods. See THEFT.

Recent Period. See POSTGLACIAL AND RECENT SYSTEM.

Recidivists, in France, are the habitual criminals. In 1883–84 the French government proposed to send them to New Caledonia, giving them a certain measure of freedom; but against this proposal the Australian colonies protested most vigorously. See NEW CALEDONIA.

Recife. See PERNAMBUCO.

Reciprocity, in Political Economy, a term for an arrangement between two countries having a protective tariff against other countries, to admit each into the other's territories certain specified taxable articles of commerce duty-free or at exceptionally light duties. The classes of articles are arranged to balance one another on one side and the other. Such mutual arrangements are sometimes called Fair Trade (q.v.) as opposed to Free Trade (q.v.) and thoroughgoing Protection (q.v.), and has been advocated as between Britain and her colonies. The mutual relation between Canada and the United States, advocated in 1885–91 by a powerful party in Canada as well as on the other side of the frontier, proposed a complete commercial union—Zollverein (q.v.); so that, while between Canada and the United States there should be no tariff at all, all goods from the rest of the world (including Great Britain) should have a strong protective tariff to face. See A. J. Wilson's *Reciprocity*, &c. (1880).

Recitative. See MUSIC, OPERA.

Reclamation. See WASTE LANDS.

Reclus, JEAN JACQUES ÉLISÉE, geographer, was born at Sainte-Foix la Grande (Gironde) on 15th March 1830, and educated at Montauban and under Carl Ritter at Berlin. In consequence of his extreme democratic views he left France after the *coup d'état* of 1851, and spent the next seven years in England, Ireland, North and Central America, and Colombia. He returned to Paris in 1858, and published *Voyage à la Sierra Nevada de Sainte-Marthe* (1861), and an introduction to the *Dictionnaire des Communes de la France* (1864). For being concerned in the Communistic outbreak of 1871 he was banished from France, but returned under an amnesty in 1879. Whilst living in exile in Switzerland he began his great masterpiece, *Nouvelle Géographie Universelle* (17 vols. 1876–94). A professor at Brussels since 1893, he has also written a great physical geography entitled *La Terre* (2 vols. 1867–68; Eng. trans. 1871 and 1887); *Histoire d'un Ruisseau* (1866); besides *Les Phénomènes Terrestres* (1873) and *Histoire d'une Montagne* (1880).

Recognisance is a kind of judicial bond entered into with a court of record, the object of which is to secure the doing of some act, as the appearance of witnesses at a criminal trial, or the keeping of the peace by one who has threatened or assaulted another. The form of it is thus: 'A B doth acknowledge to owe to our lady the Queen the sum of ten pounds,' or some other sum, to be levied of his goods if he fail in the condition endorsed; and then a condition is added, which states that, if the thing secured is done, then the recognisance is to be void. This is the mode by which justices of the peace secure the attendance of the prosecutor and witnesses at the trial of a prisoner who has been committed for trial, or the future good behaviour of one who has committed a breach of the peace. If the thing secured is not performed, then the recognisance is estreated—i.e. extracted and put in force, a debt of the amount specified being forthwith due to the crown.

Recoil. See CANNON, GUNNERY, MONCRIEFF PITS.

Recollet (Lat. *recollectus*, 'gathered together'). See FRANCISCANS, Vol. IV. p. 793.

Record, as a legal term, is used in the United Kingdom to signify anything entered in the rolls of a court, and especially the formal statements or pleadings of parties in a litigation. In general the rule is well settled that the pleadings which make up the record do not enter into details of the evidence, but merely set forth the conclusions or inferences, leaving the details of evidence to be supplied at the trial before a jury, or, if there is no jury, at the hearing before the judge or court. One of the incidents of a Court of Record is that the court or judge can commit for contempt any person who insults the court or wilfully obstructs the business. A trial by record means that one of the parties has set up some former decision of the court, while the other denies that such a decision ever existed; whereupon the only mode of solving the question is by producing the record of the former action, and so settling the dispute. In Scotland the closing of the record is a step which requires the sanction of the judge, who closes the record after each party has said all he wishes to say by way of statement and answer.

Recorde, ROBERT, mathematician, was born about 1500 at Tenby, in Pembrokeshire, Wales. He completed his education at Oxford, but, wishing to make medicine his profession, removed to Cambridge, where in 1545 he received the degree of M.D. In 1547 he was in London, engaged in the composition of *The Urinal of Physic* (1548), and was about the same time appointed physician to Edward VI., as afterwards to Queen Mary. Ten years later we find him in the debtors' prison in London, where he died miserably in 1558. His works are all in the form of dialogues between a master and his pupil, and are written in the rude English of his time; they are *The Grounde of Artes, teaching the Perfect Woork and Practice of Arithmeticke* (1543); *The Pathwaye to Knowledge* (1551), an abridgment of Euclid's *Elements*; *The Castle of Knowledge, containing the Explication of the Sphere both Celestial and Material*, (1551), an astronomical work, in which he compares the Ptolemaic and Copernican systems; *The Whetstone of Wit* (1557), a treatise upon algebra. In the appreciation of the general results derivable from algebraic formulæ he is far beyond his contemporaries, with the sole exception of Vieta (q.v.).

Recorder is a judge of a city or borough court of quarter sessions. He must be a barrister of not less than five years' standing, is appointed by the crown, holds office during good behaviour, and the salary is paid by the city or borough out of the borough fund. He sits as sole judge of the court of quarter sessions for his district, but he cannot grant licenses or be an official in licensing matters, or order rates to be levied. The recorder is not prohibited from practising at the bar, and indeed his salary is usually small. He can appoint as deputy, in case of necessity, a barrister of five years' standing, and, if need be, an assistant-recorder. In London he is elected by the Lord Mayor and aldermen, and as 'monthpiece of the

city' he certifies the customs of London. He is chief judge in the Mayor's Court of London, and is one of the judges sitting at the Central Criminal Court, commonly called the Old Bailey. Among the many well-known men who have held this post were Lord Coke and Lord-chancellor Jeffreys. There is no such office in Scotland, but the sheriff discharges similar duties.

Recorder, the name of an old musical instrument somewhat like a flageolet, but with the lower part wider than the upper, and a mouthpiece resembling the beak of a bird.

Records, PUBLIC (Lat. *recordari*, 'to remember'), contemporary authenticated statements of the proceedings of the legislature, and the judgments of those higher courts of law which are distinguished as Courts of Record. An act, 1 and 2 Vict. chap. 94, sets at rest the question what is legally to be held a record, by providing that the word records shall be taken to mean all rolls, records, writs, books, proceedings, decrees, bills, warrants, accounts, papers and documents whatsoever belonging to Her Majesty, or then deposited, or which ought to be deposited, in any of certain places of custody which are enumerated. This statute, together with the Act 40 and 41 Vict. chap. 55, and the Order in Council of 5th March 1852, has placed under the care of the Master of the Rolls the vast mass of documents stored in the Public Record Office.

Parchment is the material on which the greater portion of the records are written. The so-called 'rolls' of the Exchequer and Common Law Courts are comparatively short skins attached at the top after the manner of books, but the lines of the writing run parallel to the line of binding. In other cases they are sewed together consecutively, as in the case of the Patent and Close Rolls, and then form true 'rolls' of great length. Some records are in the form of books, as Domesday; others are filed—i.e. each document is pierced with a string or gut passed through it, the whole being fastened together in bundles. Many of the later records are written on paper.

The early parliamentary records and statutes are principally in Norman-French, which continued in partial use till the time of Henry V.; all the other great series of records, except those of parliament, are in Latin down to the reign of George II. or later, except during the Commonwealth, when English was substituted.

Public records, which can be traced in germ before the Conquest, gradually expanded under the Norman and Plantagenet kings. They enabled the subject to defend and maintain those feudal rights and privileges which were gradually trenching on royal prerogatives, and to protect himself from arbitrary exactions; while to the king they furnished precedents which could not be questioned for his calls of military service and taxation.

The various courts being the King's Courts, and following the sovereign from place to place, their earliest depositories were the royal palaces in different parts of England; but when the higher courts were permanently established at Westminster, 'treasuries,' or places of custody for the records of the different courts, were appointed there. A portion of the public records were, as far back as Henry III.'s reign, deposited in the Tower of London and the New Temple; and in the reign of Edward III. the Tower had become a permanent treasury. The parliamentary committee of 1837 enumerated among the places of deposit a room in the Tower over a gunpowder magazine, and close to a steam-engine in daily operation; a chapel at the Rolls, where divine service was performed; underground vaults at Somerset House; damp and dark cellars at Westminster Hall; the stables of the late Carlton Ride; and the Chapter-house, Westminster. From the reign of Edward II. downwards the attention of parliament had often been called to the safe custody and arrangement of the records as an object of solicitude. The fullest examination in recent times was made by a committee of the House of Commons in 1800, whose report presents the most comprehensive account of the records in existence. A commission was appointed to go on with the work which the committee had begun, and was renewed six times between 1800 and 1831. All the several record commissions directed the commissioners to cause the records to be methodised, regulated and digested, bound and secured, and to have calendars made, and original papers printed: and numerous valuable publications have been issued by the commissioners from time to time. The new edition of Rymer's *Fœdera*, the calendar of Inquisitiones Post Mortem, and the editions with excellent indexes of the earlier Patent and Close Rolls and the Rolls of the Curia Regis are especially to be noted. An inquiry as to the materials for English history to be found in the Vatican and other foreign libraries was instituted about 1834 by the Record Commissioners, and the results were printed under the title 'Appendices to Report on the *Fœdera*,' but have never been formally published. Copies, however, were disseminated, and may be consulted in the British Museum Library and elsewhere, but the report itself has never appeared. Following this example, agents have been employed by the Public Record Office at Paris, Simancas, Venice, and Rome for many years, and the results of their labours have been partly published, while the remainder may be consulted at the Record Office.

A full investigation into the proceedings of the Record Commissioners was made by a committee of the House of Commons in 1835, and since 1840 annual reports have been issued by the Deputy-keeper of the Records. By the statutes referred to above the Master of the Rolls is empowered to appoint a deputy-keeper of the records, and, in conjunction with the Treasury, to do all that is requisite in the execution of this service. He makes rules for the management of the office, and fixes what fees may be demanded. He allows copies to be made, which, when certified by the deputy and assistant keepers, and authenticated with the seal of the office, are producible as evidence in courts of law. The Home Secretary directs from time to time such of the catalogues, calendars, and indexes, and such of the records as he thinks fit, to be printed, and sold at prices fixed by him. All Record publications may be procured directly from the Queen's Printers, East Harding Street, Fleet Street, and detailed catalogues of them may be obtained from the same source.

The present Public Record Office, a handsome fireproof building in Fetter Lane, was begun in 1851 on a plan which admits of extension as the records of the kingdom accumulate (for it must be remembered that modern documents as well as old form the subject of the deputy-keeper's care), and provision has been made for the transfer into his hands of the records which are growing from day to day in the great administrative and legal departments of the state, as soon as they have ceased to be needed for frequent reference.

The principal contents of the Record Office may be classified under seven principal groups. Records of (1) the Superior Courts of Law, including the Courts of Chancery, Queen's Bench, and Common Pleas, and the Exchequer, with its important fiscal as well as legal machinery; (2) Special and Abolished Jurisdictions, such as the Courts of Arches, Chivalry, Requests, and Star-chamber; (3) Duchy

of Lancaster; (4) Palatinate of Durham; (5) Palatinate of Lancaster; (6) Principality of Wales; (7) State Papers and Departmental Records, including the archives of the Admiralty, Colonial Office, Foreign Office, Home Office, Treasury, and other departments.

Several handbooks to this enormous mass of materials have been published, of which the most useful are *An Account of the most important Public Records of Great Britain*, by C. Purton Cooper (2 vols. 8vo, 1832); *Official Handbook to the Public Records*, by F. S. Thomas (8vo, 1853); *Our Public Records*, by A. C. Ewald (8vo, 1873); and *A Guide to the Principal Classes of Documents preserved in the Public Record Office*, by S. R. Scargill-Bird (8vo, 1891). An introduction to the art of searching for materials, whether historical, topographical, genealogical, or legal, is afforded by the present writer's *Records and Record-searching* (8vo, 1888), while a person not acquainted with the ancient legal hands cannot do better than consult C. T. Martin's edition of Wright's *Court Hand Restored*. This contains useful glossaries, lists of abbreviations, ancient alphabets, and specimens of the old handwritings, which vary greatly from century to century. See PALÆOGRAPHY.

The bulk of the national records may be imagined from the fact that, to cite only two classes of documents, there are more than 18,000 Close Rolls, and many thousands of Coram Rege and De Banco Rolls, each of the latter in the Tudor period containing from 500 to 1000 skins of parchment.

The supreme needs of such a depository are indexes, and indexes *to* indexes. The latter requirement is tolerably supplied by the 'List of Calendars, Indexes, &c.' in appendix ii. to the 41st Report of the Deputy-keeper (8vo, 1880); but the indexes themselves to which this list of 748 items is a directory are sadly deficient. They do not furnish guidance to a twentieth part of the mass of documents, and many of them are merely eclectic. A recent addition to this series is 'General' Plantagenet Harrison's voluminous MS. Index to the De Banco and other rolls, which has been acquired at the public expense.

Numerous charters of the greatest antiquity are to be found in the Public Record Office, and there of course is preserved Domesday Book; but, understanding by 'records' a fairly continuous series of official documents, we may say that the earliest are the Pipe Rolls or Great Roll of the Exchequer. That for 31 Henry I. stands alone, but is soon followed by an unbroken series of Pipe Rolls extending from 2 Henry II. down to modern days. These are accounts of the revenue of the kingdom both as regards receipt and expenditure, and they contain items of the greatest possible historical interest. The Pipe Roll Society (established 1884) is gradually printing them. Next in order of antiquity are the Patent Rolls, which begin with 3 John and come down to the present day, and the Close Rolls, which present a similarly unbroken series from 1204. The former contain matters *patent* or open to the public, such as grants of offices, crown-lands, liberties, confirmations of previous grants, grants to corporate bodies, patents of honour, licenses, pardons, ratifications of treaties, proclamations, safe-conducts, presentations to benefices, restitutions of temporalities to bishops, abbeys, &c.

The Close Rolls contain mandates, letters, and writs of a private nature which were closed or sealed up, and record the directions of the king as to domestic and public matters, orders to the sheriffs on all kinds of questions, and directions as to raising subsidies. The historical value of these two sets of Rolls is immense, as in the earlier years all the state correspondence, both foreign and domestic, is recorded in one or other of them.

Other records of great value which date either from the reign of Edward I. or from still earlier times are the Cartæ Antiquæ, early transcripts of charters ranging from Ethelbert, king of Kent, to Edward I.; Charter Rolls, containing the king's grants of land, dignities, &c.; Escheat Rolls, accounts of lands and property forfeited to the crown; Feet of Fines, records of the endings of fictitious suits as to land, which are in reality deeds of conveyance, ranging from 7 Richard I. to William IV.; Rotuli Curiæ Regis, some of which are as early as Richard I., and are records of the cases decided in the King's Court up to the reign of Edward I., by whom the court was divided into the King's Bench, Common Pleas, and Exchequer; Coram Rege Rolls, or records of the crown side of the King's Bench, including Assize, Eyre, Coroners, and Gaol Delivery Rolls; De Banco Rolls, or records of the Court of Common Pleas; Inquisitiones Post Mortem, a treble series (Chancery, Wards and Liveries, Exchequer) of inquiries as to the land held by tenants *in capite* at time of decease, and as to their heirs; Originalia Rolls of the Exchequer, containing entries of any service, rent, or salary reserved in grants or charters; Subsidy Rolls, also Exchequer documents, often containing the names of the taxpayers under villages and towns, and most valuable to the topographer; Pell Records, including the Liberate Rolls and Issue Rolls, consisting of entries of payments of salaries, pensions, &c.; Customs Rolls for various ports; Memoranda Rolls (Exchequer), enrolments of writs of *Scire Facias*, informations, outlawries, and a multitude of other matters; Pardon Rolls, enrolments of pardons up to 2 James I.; Quo Warranto Rolls, respecting usurpations of offices or franchises; Oblata or Fine Rolls, offerings to the king for renewals of charters, enjoyment of lands, offices, and privileges; Parliament Rolls, petitions to and proceedings in parliament, beginning from the reign of Edward I.; Statute Rolls, the Journals of the Lords and Commons from Henry VIII., and other parliamentary records.

The foregoing are more or less continuous records, but there are some of an occasional character or of limited annual duration, but still of great importance, such as the Hundred Rolls, presentments of unjust claims of privileges such as free warren frankpledge, and assizes of bread and ale; the Liber Niger, and Liber Rubeus Scaccarii, and Testa de Nevill, lists of tenants *in capite* and knight's fees; Taxatio Ecclesiastica, an account (1291) of the taxation of benefices; Inquisitiones Nonarum, which included a valuation of benefices in the fourteenth year of Edward III.; French Rolls, Norman Rolls, Gascon Rolls, copies of treaties, truces, orders, summonses, grants of safe-conduct, and other items respecting the affairs of those parts of France that were under the English crown; Valor Ecclesiasticus, a valuation of benefices in 26 Henry VIII.; Baga de Secretis, trials for state offences of a specially secret nature, from Anne Boleyn to the Stuart adherents of 1715 and 1745; Royalist Composition Papers (1649–60), containing statements as to estates and families of Royalists.

The *state papers* (Domestic, Foreign, Colonial, Irish, and Scotch) originally sprung from the Privy-council and Chancery, and include the correspondence of the Privy-council, secretaries of state, and other public departments, with miscellaneous domestic papers from the time of Henry VIII. These, being the correspondence of the highest political officers of the kingdom, relate to an infinite variety of matters. They have been carefully arranged, and more than 120 volumes of

calendars, covering a large portion of the field, have now been published.

The activity of the authorities of the Public Record Office has, however, not been confined to the records stored in Fetter Lane, for since 1858 the Master of the Rolls has issued, under the authority of the Treasury, more than 200 volumes of the series known as *Chronicles and Memorials of Great Britain and Ireland*. These are carefully edited texts of the ancient chroniclers, such as William of Malmesbury, Gervase of Canterbury, William of Newburgh, and Matthew Paris, collated with MSS. in English and continental libraries, and prepared by specially selected editors.

The Historical Manuscripts Commission, though not in name a department of the Record Office, is in reality closely connected with it. In answer to requests from this body, private libraries and muniment rooms all over England, Ireland, and Scotland have, almost without exception, been thrown open to authorised inspectors, who have reported on their principal MS. contents. Since 1870 many volumes of reports on these collections have been published, embodying transcripts of documents of special interest, and giving brief abstracts of a host of others.

The Literary Search Room at the Public Record Office is open from 10 to 4 every day, except Saturday, when it closes at 2 o'clock, and a few public holidays, when the office is shut up. Any respectable person may, on entering his name and address in a book kept in the lobby, attend and consult almost any document he may desire to see. A few of course are subject to special reservation.

Scotland.—The public records of Scotland were undoubtedly numerous and multifarious as early as 1282, as appears from an inventory of muniments examined in that year by the order of Alexander III.; and another inventory of Scottish rolls and writs was compiled at the command of Edward I. of England in 1291. Few, if any, of the documents mentioned in these lists are now known to exist. In 1651 the records of the Scottish parliaments and courts of justice were removed by Cromwell to the Tower of London. The more important of these, to the number of 1609 volumes, were restored in 1657, and the remainder, after the restoration of Charles II., were packed in eighty-five hogsheads and shipped on board a frigate for Scotland; but in a violent storm they were transferred to a smaller vessel, which went down with its precious cargo. The control of the records has from very early times been entrusted to the Clerk of the Rolls and Registers, or Lord Clerk Register, one of the high officers of state, who had a seat in the Scottish parliament, and to whom, and his deputies and other officers appointed by him, it was assigned to superintend both the formation and custody of the public records. These were at first in the inconvenient form of rolls, but in the reign of David II. the practice was introduced of writing them in books. By an act of 1463 the king's rolls and registers were appointed to be put in books; but the accounts in the Exchequer continued, nevertheless, to be kept in rolls till the passing of another act in 1672, appointing them to be written in books. Originally the records were kept in the Castle of Edinburgh, but in later times they were deposited under care of the Clerk Register, in the Laigh Parliament House, now part of the Advocates' Library; and shortly before the Union the whole records were transferred to that depository, where they continued till the erection of the large building called the General Register House (1787). The Register House serves the purpose of preserving and making available the national muniments, as well as accommodating the whole offices of record connected with the supreme court. The Lord Clerk Register and his depute have now merely the *custody* of the records, their preparation being entrusted to another class of officers.

Under the Scottish records are included the Acts of Parliament and of Privy-council, and the records of the supreme courts of justice; also the records of the Great Seal, Privy Seal, and Signet. An important class of records are the *Retours of Services*. A service is by the law of Scotland, in cases of intestacy, necessary to transmit a right to real property to the heir from his ancestor. At present this service consists of the decision of the sheriff of the county or the sheriff of Chancery; but the form in use till 1847 was by retour, a writing which contained the verdict of a jury returned in answer to a brieve from Chancery for finding the heir at the death of his ancestor. The register of retours contains services from 1545.

The registers connected with the transmission of heritable rights are even more important. After several unsuccessful attempts to introduce a system of registration, the *Register of Sasines* was established by Act 1617, chap. 16. By the system then introduced, since continued with modifications in detail, all instruments requisite to the transmission of real property must, in order to convert mere personal right into real right, be put on record for publication. Besides the general register in Edinburgh there were particular registers for the various counties kept at their respective county towns; but any instrument might be recorded either in the particular or the general register. Volumes were issued from the General Register House to the local recorders of sasines, which, when filled, were returned to the General Register House. This arrangement was changed by the Lands Registration Act of 1868, providing for the entire discontinuance of the particular registers before the last day of 1871, and enacting that all writs of this class be thenceforth recorded in the general register in Edinburgh, which register is so kept that the writs applicable to each county are recorded in separate series of volumes. By means of the Register of Sasines any title to real property can be ascertained with certainty and precision, and may, if necessary, be traced back nearly three centuries. It is also obligatory to record in separate registers all instruments necessary for the constitution, transmission, and extinction of voluntary encumbrances. See REGISTRATION. This system, while confirming the credit of the proprietor, also operates in favour of the security of creditors. There is a special *Register of Entails*, in which, in terms of Act 1685, chap. 22, deeds of entail must be recorded at the sight of the Court of Session. There are also the records of the various commissariats, which include testaments and other relative documents. The object of registration in all these cases is *publication;* but charters by subjects, dispositions, bonds, contracts, and other probative writs may, under Act 1698, chap. 4, be recorded in the *Register of Deeds* for *preservation*. A third object of registration is *execution*. Every deed constituting a personal claim of debt, or an obligation to perform some lawful prestation, if intended to be made the subject of personal diligence for payment or performance, must be registered previously to execution being issued on it. Calendars of state papers relating to Scotland preserved in the English Record Office have been recently published; while the publication of the Scottish records in the Register House has been going on at intervals since 1811. These include the Acts of Parliament, Register of the Great Seal, Register of the Privy-council, Exchequer Rolls, Accounts of the Lord High Treasurer, and other records.

See Ayloffe's *Calendars of Ancient Charters* (1774); *Acts of the Parliaments of Scotland*, vol. i. appendix to preface; *Reports of the Public Record Commissions*; the Record Publications—preface to the earliest volume of each series.

Ireland.—Many of the records perished during the wars prior to the final reduction of Ireland, and those which survived these commotions were long exposed to mutilation and destruction from the unsatisfactory arrangements for their custody. A commission was appointed in 1810 for the preservation and arrangement of the Irish Records, whose labours, conducted with considerable success, were terminated by the revocation of the commission in 1830. In 1847 commissioners were again appointed to investigate the state of the records, in consequence of whose labours a bill for their safe custody was prepared, but afterwards abandoned. In 1867, however, the Public Records (Ireland) Act was passed, and from 1869 the Reports of the Deputy-keeper of the Irish Records have been annually published. These include some documents and calendars in their appendices, notably a calendar of 'Fiants' (*fiant literæ patentes*) from Henry VIII.

Three volumes of a calendar of the Irish Patent and Close Rolls were published in 1861–63; and some other publications, including volumes of facsimiles of national MSS., have been issued by the Irish Record Office. This department since its formation in 1869 has done a great work in the way of collecting records from various depositories and arranging and cataloguing them. The records are open to searchers on payment of fees, but the deputy-keeper may dispense with fees if he thinks that literary profit will accrue to the public from the searchers' work. One important feature of the Irish Record Office is the collection of Parish Registers made under Acts 38 and 39 Vict. chap. 59, and 39 and 40 Vict. chap. 58. This is an example which should be followed in England.

Recovery. See ENTAIL.

Recruit, a person who voluntarily adopts the profession of arms and enlists in the army. See, for the conditions, ENLISTMENT, ARMY, REGIMENT.

Rectifying is a process applied to alcohol, chloroform, or other volatile liquid, by which the last traces of impurities are removed by distillation. Many varieties of stills and condensers have been devised for this purpose, for further reference to which see DISTILLATION, and ALCOHOL.

Rector (Lat. 'ruler'), in the Church of England, is a clergyman who has the charge and cure of a parish where the tithes are not impropriate, and who accordingly has the whole right to the ecclesiastical dues therein; where the tithes are impropriate the parson is a Vicar (q.v.). In the Episcopal Churches of the United States and (since 1890) Scotland all incumbents are called rectors. See also EDUCATION, and UNIVERSITIES.

Rectum, the terminal portion of the intestinal canal, named, from its comparatively straight course, the rectum (see DIGESTION), is the seat of various affections requiring medical or surgical assistance. Some of these affections, as fistula, fissure (see ANUS), piles, prolapsus ani, have already been considered. Amongst the other diseases of the rectum of sufficient importance to claim notice in these pages are—

(1) *Stricture of the Rectum*, which may be either of a simple or malignant nature. *Simple stricture* consists in a thickening and induration of the submucous tissue, less often of the muscular or mucous coat of the rectum, so as to form a ring encroaching on the calibre of the tube. It is situated most often about an inch from the anus, and the contraction is so great and unyielding that it is often difficult to pass a finger through it. It may occur as the result of injury or operation, of old ulceration (e.g. from dysentery), of syphilis, or without ascertainable cause. The symptoms are constipation and great pain, and a straining in evacuating the fæces, which, if not liquid, are passed in a narrow, flattened, or worm-like form that is very significant of the nature of the case. In an advanced stage of the disease diarrhœa and prolapsus often supervene. However great may be the constipation, strong purgatives must be altogether avoided. Soft and unirritating evacuations must be procured by such medicines as the confection of senna combined with sulphur (see PILES), or injections of castor-oil or of tepid water. The diet should be regulated so as to assist the action of the medicines. Nutritious soups are serviceable, since, at the same time, they support the strength and leave little matter to be excreted. Gradual dilatation by suitable bougies often gives great relief, but must be steadily persevered with, as the contraction is almost certain to recur. *Malignant stricture*—most commonly due to the scirrhous, but sometimes to the epithelial form of cancer—is by no means a very rare affection. Until ulceration sets in the symptoms are like those of simple stricture, only exaggerated in degree; but afterwards there is a discharge of fetid muco-purulent matter streaked with blood. In this disease the treatment can, in most cases, be only palliative. Sometimes, however, if the tumour is low down and localised it may be removed with at least temporary relief. If complete obstruction occur, or is threatened, the surgeon may resort to the formation of an artificial anus in the loin or groin as a last resource.

(2) *Spasm* of the *sphincter ani* muscle is characterised by extreme pain in the region of the anus, especially when an attempt is made to evacuate the bowels. The muscle contracts so firmly that the surgeon cannot easily introduce the finger into the rectum. The spasm may be caused by piles, by fissure of the anus, by ulceration of the rectum, and sometimes apparently by mere constipation. It is often relieved by the application of the belladonna ointment of the British Pharmacopœia.

(3) *Neuralgia of the rectum*, known also as *proctalgia*, is sometimes met with, and is especially prone to attack children and gouty persons. It is usually relieved by the judicious use of aperient medicines and such treatment as is used for other forms of Neuralgia (q.v.).

(4) *Pruritus podicis*, or *itching of the anus*, is a very common and extremely troublesome affection. Sometimes it depends on the presence of threadworms, of old piles, constipation, or some other local cause of irritation, while in other cases it is one of the manifestations of some constitutional condition. The treatment must depend upon the exciting cause. See works on the rectum by Allingham, Cripps, Henry Smith.

Reculver, a village of Kent, 1 mile from the sea, and 9 miles W. of Margate, with remains of the Roman station *Regulbium*. Pop. 298.

Recusants, persons who refuse or neglect to attend at the worship of the established church on Sundays and other days appointed for the purpose. The offence as a legal one may be held to date from 1 Elizabeth, chap. 2; but there were four classes punishable under the statutes against recusancy—simple 'recusants;' 'recusants convict,' who absented themselves after conviction; 'popish recusants,' who absented themselves because of their being Roman Catholics; and 'popish recusants convict,' who absented themselves after conviction. Protestant dissenting recusants were

relieved from the penalties of recusation by the Toleration Act of 1 Will. and Mary, chap. 18. Catholics were partially relieved in the year 1791, and completely by the Emancipation Act of 1829.

Red. Most of the important red pigments have been already noticed. For carmine and crimson lake prepared from cochineal, and also for the madder reds, see LAKES. The reds of which oxide of iron is the colouring ingredient—viz. Indian red, Venetian red, and light red—are referred to under OCHRES. Vermilion (q.v.) is one of the finest and most beautiful reds. It has now been ascertained, however, that it is not always quite so permanent, at least as a water-colour pigment, as was formerly supposed. For house-painters' use this colour is often adulterated with red lead, which, though forming a useful paint for some common purposes, is fugitive. The substances used for dyeing textile fabrics red are noticed under the head DYEING.

Redan. See FORTIFICATION, SEBASTOPOL.

Redbreast (*Erythaca rubecula*), a bird of the family Sylviidæ, well known in the British Isles because of its very general distribution, its early and legendary associations, its conspicuous plumage, and the fact of its being resident. Its range is gradually extending northwards, and now it is found breeding in the Hebrides and Orkneys; in spring it is found on the island of Jan Mayen, in autumn it visits the Faroes, but it has not yet been recorded in Iceland. Southwards it breeds throughout Europe (but only locally in the south of Spain), in North-west Africa and the Canaries, Madeira, and the Azores; eastwards to the Ural Mountains. In winter its migrations extend to the Sahara, Egypt, Palestine, and Persia. The redbreast, known familiarly as Robin or Robin Redbreast, is about 5¾ inches long, olive-brown in colour on the upper parts; chin, throat, and upper breast reddish orange, bordered with bluish gray on the sides of the neck and shoulders; under parts dull white; bill black; legs and feet brown; the body fairly full and round, the legs slender. The female is usually but not always duller than the male. In habit robins are domineering and pugnacious; solitary, or found only in pairs, preferring plantations, but coming near dwelling-houses when forced by severe weather. Nesting begins in March. The nest of dead leaves, dried grass and moss, and lined with hair and feathers, is made in banks, hollow trees, and sometimes in strange and extraordinary places. The eggs, five to seven, are usually white with light reddish blotches, or pure white. Two or three broods are produced in the season. In autumn the young are forced by their parents to migrate, and at this season there is generally a great influx of robins from the northern parts of the Continent, where they have been passing the summer. The food consists chiefly of insects and worms; often of berries and other fruits; and in winter bread-crumbs and scraps of meat. Its song is sweet and plaintive, but of little compass, and not much noticed when other songsters abound. The widely distributed robin of the United States and Canada is a Thrush (*Turdus migratorius*).

Redcar, a popular bathing-resort in the North Riding of Yorkshire, 10 miles by rail NE. of Middlesborough. Its smooth, firm sands stretch 10 miles from the mouth of the Tees to Saltburn. Pop. (1851) 1032; (1891) 2818.

Red Cedar. See JUNIPER.

Red Crag. See PLIOCENE SYSTEM.

Red Cross, THE, is the badge and flag adopted by every society, of whatever nation, formed for the aid of the sick and wounded in time of war, recognised and authorised by the military authorities of its own nation, and enjoying certain privileges and immunities under the treaty known as the Convention of Geneva. Hence 'Red Cross Society' has become a generic name for all such voluntary efforts, and cannot be monopolised by any one of them. For three centuries or more a medical service has been attached to armies, and was long thought sufficient for every emergency, but the revelations made during the Crimean war (1853–56) were terrible. The merciful mission of Miss Nightingale and her companions, while reducing the losses by one-half, threw light upon shocking defects, and compelled the acknowledgment of want of organisation in everything connected with the health of the troops and care for the wounded. Nevertheless, when the war broke out (1859) in Lombardy similar inefficiency was apparent. Loud complaints arose, but the first practical result ensued from the publication by M. Dunant of his *Souvenir de Solferino*. The account of this battle (June 24, 1859), which lasted fifteen hours and in which 300,000 combatants were engaged, was so heart-rending as to force public attention to the necessity for supplementing the medical and sanitary service by volunteer societies trained and organised in time of peace. The book was discussed at Geneva at a meeting of the *Société Genèvoise d'Utilité Publique*, February 9, 1863, a date which may be taken as the starting-point of the Red Cross. An international conference was then convoked, which assembled at Geneva, October 26, 1863, and included among its thirty-six members delegates from fourteen governments and six associations. A proposed code of international enactments was discussed, and the main recommendations agreed to were (1) the formation in each country of a committee to co-operate with the army sanitary service in communication with the government, and occupying itself in time of peace with preparing supplies of hospital stores, training nurses, &c., and during wars furnishing the same in aid of their respective armies, neutral nations being invited to assist such national committees; (2) the declaration of the neutrality of hospitals, of the officials of the sanitary service, of the unpaid nurses, of the inhabitants of the country aiding the wounded, and even of the wounded themselves. The conference suggested the adoption of the same distinctive and uniform badge (the red cross on a white ground) for all hospitals and sanitary officials as well as for the volunteer relief agents. A treaty, the Convention of Geneva, embodying these resolutions was signed at a second conference at Geneva in 1864 by twelve out of sixteen representatives there assembled, and it has since been acceded to by every civilised nation. International conferences have been held at Paris (when the convention was extended to naval warfare), Berlin, and Vienna, but the resolutions passed at Geneva have undergone no material alteration. The International Committee still continues at Geneva, for though its pioneering work is over it forms an important centre of communication between belligerent states, and appoints agencies whenever war is declared, to facilitate the action of the different societies and the transmission of relief offered by neutrals. The English Order of the Hospital of St John of Jerusalem, the National Society for Aid to the Sick and Wounded in War, the Eastern War Sick and Wounded Relief Fund, the Stafford House Fund, the French Société de Secours aux Militaires Blessés, the Russian Johanniter, and the Austrian Samariter Verein are among the best known of the numerous Red Cross societies. The International Committee at Geneva publishes quarterly, since 1869, the *Bulletin International des Sociétés de la Croix Rouge*. See also *The Red Cross: Its Past and*

Future, by G. Moynier (trans. by J. Furley, 1883), a Red Cross knight of the foremost rank, having been the first to enter Paris with provisions, and having received for his many and great services the gold medal from the committee at Versailles, and decorations from the various French Red Cross societies, which contains the text of the Convention of Geneva; *Under the Red Cross*, by Pearson and M'Laughlin; *Notes and Recollections*, by W. M'Cormack. See AMBULANCE.

Red Cross, THE ROYAL. This decoration was instituted by Queen Victoria in 1883. It is conferred on any ladies, English or foreign, recommended by the Secretary of State for War, for special exertions in providing for the nursing, or for attending to sick and wounded soldiers and sailors. The decoration is a cross of crimson enamel gold-edged, attached to a dark-blue ribbon red-edged, one inch in width, tied in a bow and worn on the left shoulder.

Red Deer, or STAG (*Cervus elaphus*), a large and very handsome animal, inhabiting some of the forests of Europe, West Asia, and North Africa. Those living in the more northern parts are smaller. In Britain red deer are found on Exmoor, in the Highlands of Scotland, and in some parts of Ireland.

Stag, Hind, and Calf (*Cervus elaphus*).

The full-grown animal stands over 4 feet at the withers, and is dark reddish brown in colour, slightly grayish in winter. The Antlers (q.v.), with which the rival males fight, belong to what is called the elaphine type, having protrusive brow-tines, well-marked bez-tines, a rounded beam, and terminal snags 'arranged in a cup or crown.' As usual, they are shed in the spring of each year, and gain 'points' with each year's fresh growth, a 'royal stag' having twelve, though this is not the maximum. Darwin mentions an antler 30 inches in length with fifteen snags, and another with thirty-three, while Flower refers to 'a pair of antlers, weighing 74 lb., and with forty-five points.'

The male stags are distinguished by the possession of antlers, and are rather larger and stronger than the females. Their voice is also stronger, for they bellow very loudly when enraged or when challenging their rivals. The combats are very fierce, and sometimes fatal even to both combatants, for their antlers sometimes interlock inextricably. In fighting, the projecting brow-tines form most effective weapons. The breeding season is in September or October, but the young are not born till the end of May or the beginning of June. As in most species of Cervus they are first slightly spotted with white. In the first year the young male has only a hint of antlers, in the second year only small unbranched beams; thereafter a tine is gained each year. Nearly allied is the North American Wapiti (*C. canadensis*), and there are closely related species or varieties in Persia, Cashmere, and Tibet. Baillie Grohmann in *Sport in the Alps* (1896) has much about red deer. See DEER, DEER FORESTS, STAG-HOUND; *Red Deer*, by R. Jefferies (1884); and *The Red Deer*, by Macpherson and others ('Fur and Feather' Series, 1896).

Redditch, a town on the borders of Worcester and Warwickshires, stands on an acclivity 13 miles SSW. of Birmingham by rail. Needles, pins, fish-hooks, and fishing-tackle are made extensively. Pop. (1851) 4802; (1881) 9961; (1891) 11,295.

Reddle, RADDLE, or RED CHALK (Scot. *keel*), an impure peroxide of iron (ferric oxide) associated with very variable proportions of clay or chalk, or sometimes other substances. It varies greatly too in hardness, some kinds being difficult to crush and others quite soft. In colour it passes from a pale brick-red to a tint occasionally nearly as bright as vermilion. It is found in many places abroad, and in England in Somersetshire, the Forest of Dean, at Wastwater in Cumberland, and, of a quality valuable for polishing optical glasses, near Rotherham in Yorkshire. Some kinds of it are used for marking sheep, others for carpenters' and masons' pencils, and the finer qualities for artists' crayons. Red ochre is one of the varieties.

Red Earth, the name given to the reddish loam or earth which so frequently occurs in regions composed of limestones. This earth is the insoluble residue of those portions of the calcareous rock which have been dissolved by rain. Such red earths are of common occurrence in limestone caverns. See CAVES.

Redemptionists, one of the names of an order of monks devoted to the redemption of Christian captives from slavery. They are more frequently called Trinitarians (q.v.).

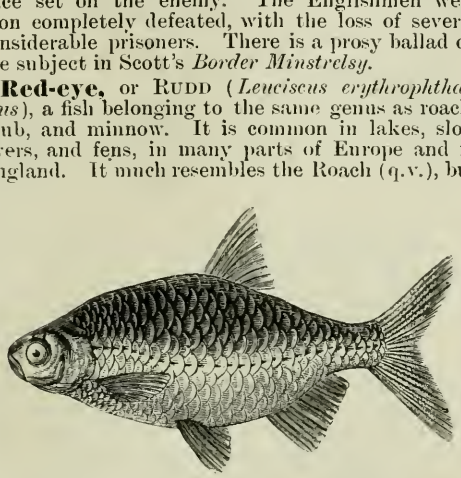
Redemptorists, called also LIGUORIANS, a congregation founded by St Alfonso Liguori (q.v.).

Redesdale, the valley of the river Reed in Northumberland, extending almost from the Scottish border in a south-easterly direction for over 16 miles, until it opens up into the valley of the Tyne, the river joining the North Tyne at Reedsmouth. It is for miles a mere mountain vale, sloping upwards into bleak and dreary moorland, but it has a quiet beauty of its own that is not easily forgotten by the traveller. The river springs out of the Cheviot Hills, which lie athwart the head of the dale, and down its course from Carter Toll on the border lay one of the chief roads into England. Watling Street itself traverses its middle and upper part. Near the southern end of Redesdale is the famous field of Otterburn (q.v.), but 16 miles from the border, which point again is but 10 miles from Jedburgh. The men of Redesdale of old were brave and turbulent, and bore more than their share in Border feuds and forays.—Redesdale gave from 1877 the title of earl to John Thomas Freeman Mitford (1805–86), who was son of the ex-Speaker, John Mitford (died 1830), first Baron Redesdale, and who himself from 1851 was Chairman of Committees in the House of Lords, and a determined enemy of change in ecclesiastical matters.

Redeswire, RAID OF THE, a battle fought 7th July 1575 close to the English border at the pass leading across the Cheviots into Redesdale, about 6 miles ESE. of Chesters in Roxburghshire. A number of Scots attacked an English force to avenge the slaughter of a countryman, but were

beaten back and on the point of being utterly routed, when the provost and townsmen of Jedburgh arrived hot from the 10 miles' march, and at once set on the enemy. The Englishmen were soon completely defeated, with the loss of several considerable prisoners. There is a prosy ballad on the subject in Scott's *Border Minstrelsy*.

Red-eye, or RUDD (*Leuciscus erythrophthalmus*), a fish belonging to the same genus as roach, chub, and minnow. It is common in lakes, slow rivers, and fens, in many parts of Europe and in England. It much resembles the Roach (q.v.), but



Red-eye or Rudd (*Leuciscus erythrophthalmus*).

is shorter and deeper. It is richly coloured, the name Rudd referring to the colour of the fins, the name Red-eye to that of its iris. The fish is better eating than the roach, and sometimes attains a weight of 2 lb.

Redgrave, RICHARD, painter, born in London on 30th April 1804, in 1826 was admitted a student of the Academy, and was elected an A.R.A. in 1840, an R.A. in 1851. From 1847 onwards he took a prominent part in art instruction, and in 1857 was appointed Inspector-general of Art Schools, which office, with that of Surveyor of the Royal Pictures, he resigned in 1880, being then created a C.B. In 1882 he was placed on the list of retired academicians, and next year he ceased to exhibit, having since 1825 contributed 145 pictures to the Academy, besides forty sent elsewhere. He wrote, with his brother, *A Century of English Painters* (1866), and edited several valuable catalogues. He died 14th December 1888. See *Memoir* by his daughter (1891).

Reding, ALOYS VON, the famous champion of Swiss independence, was born in 1765, in the canton of Schwyz. After serving in Spain he returned to Switzerland in 1788. As captain-general of the canton of Schwyz he repulsed the French Republicans, May 2, 1798, at Morgarten. After the formation of the Helvetic Republic Reding was one of those who eagerly worked for the restitution of the old federal constitution. In 1802 he founded in the eastern parts of Switzerland a league, with the intention of overthrowing the central government. Reding went to Paris in order to gain over the First Consul, but failed. Till 1803, and again after 1809, he acted as Landamman or chief-magistrate of Schwyz. He died 5th February 1818.

Red-letter Days. See BLACK LETTER.

Red Liquor. See CALICO-PRINTING, p. 645.

Redoubt. See FORTIFICATION.

Redout Kalé, a fortified post on the Black Sea coast of Russian Caucasia, is situated in a marshy region at the mouth of a small river, about 10 miles N. of Poti. It was the chief shipping-place for Circassian girls to Turkey, and was captured by the British fleet in 1854.

Redpole. See LINNET.

Red River, the lowest western branch of the Mississippi, rises near the eastern border of New Mexico, flows eastward through Texas, forming the entire southern boundary of Indian Territory, thence south-east through Arkansas and Louisiana, and enters the Mississippi below 31° N. lat. It is 1600 miles long, and receives numerous branches, the Washita (Ouachita) the most important. It is navigable for seven months to Shreveport (350 miles). A few miles above is the Great Raft, of driftwood, which formerly blocked up the river.

Red River of the North, a navigable river of the United States and Canada, rises in Elbow Lake, Minnesota, near the sources of the Mississippi, and flows south and west to Breckinridge, then north, forming the boundary between Minnesota and North Dakota, and so into Manitoba and through a flat country to Lake Winnipeg. Its course is 665 miles (525 in the United States). The Red River Settlement was the origin of Manitoba (q.v.). For the Red River Expedition, see CANADA, Vol. II. p. 695, and RIEL.

Red Root (*Ceanothus*), a genus of deciduous shrubs of the natural order Rhamnaceæ. The common Red Root of North America (*C. americanus*), which abounds from Canada to Florida, is a shrub of two to four feet high, with beautiful thyrsi of numerous small white flowers. It is sometimes called *New Jersey Tea*, an infusion of its leaves being sometimes used as tea. It serves also as an astringent, and for dyeing wool of a cinnamon colour. A Mexican species has blue flowers, and a Californian kind is used for evergreen hedges.

Redruth, a town of Cornwall, on a hillside (414 feet) in the centre of a great mining-district, 9 miles by rail W. by S. of Truro. It has a town-hall (1850), public rooms (1861), a miners' hospital (1863), &c. William Murdock (q.v.) here in 1792 first used gas for lighting purposes. Pop. (1851) 7095; (1871) 10,685; (1891) 10,324.

Red Sea. The Red Sea is an arm of the Indian Ocean, running north-north-west from the Gulf of Aden, with which it communicates by the Strait of Bab-el-Mandeb, 13½ miles across. Its length is about 1200 miles, and its width in the central portion is between 100 and 200 miles, the greatest breadth being about 205 miles; it narrows towards the southern entrance, while in the north it is divided by the peninsula of Sinai into two gulfs, the Gulf of Suez, 170 miles long by 30 miles wide, and the Gulf of 'Akaba, 100 miles in length.

The Arabian coasts of the Red Sea are usually narrow sandy plains backed by ranges of barren mountains; the African coasts towards the north are flat and sandy, but farther south high tablelands rise some distance inland, culminating still farther south in the lofty mountains of Abyssinia. A marked feature in the configuration of the Red Sea is found in the large existing and upraised coral-reefs running parallel to both the eastern and western shores, those to the east being more extensive and farther from the coast than those to the west; the most important are the Farisan Archipelago in the eastern reef, and the large island of Dahlak, lying off Annesley Bay, in the western reef. In addition to the islands of organic formation mention may be made of the volcanic group lying in 14° N. lat., the largest of which, Jebel Zugur, is 10 miles long, 7 miles wide, and 2074 feet in height; farther north, on the islet of Jebel Teir, is a volcano which was active until quite recently. A dangerous reef, the Dædalus, lies directly in the path of steamers in 24½° N. lat., and a lighthouse has been placed on it. The principal harbours on the Red Sea are Mocha, Hodeida, Lokeyyah, Jiddah, and Yenbo' on the Arabian coast, and Massowah, Khor Nowarat, and Suakim on the African coast.

In ancient times the Red Sea was used as a means of communication by the Phœnicians and other maritime peoples, until the discovery of the route round the Cape of Good Hope diverted the traffic into another channel, only to be revived, however, on a much more extensive scale with the construction of the Suez Canal.

The tides are very variable, depending largely on the direction and force of the winds, which also to a great extent determine the direction and velocity of the surface currents. The hot climate is due to the almost cloudless sky, and consequent want of rain, the altitude of the sun, and the absence of rivers. The mean temperature of the air generally ranges between 70° and 94° F. during the day, though readings of over 100° are often registered in the shade; but during the night the temperature may fall to the freezing-point, owing to radiation in the clear atmosphere. The prevailing wind on shore is north-north-west almost universally, but from October to May south-south-east winds prevail over the southern portions of the sea, a belt of calms and variable winds occurring in the central regions, while in the northern portions the usual north-north-west winds are met with. Evaporation is very great, and the air over the water is always very moist in the summer; hurricanes are unusual, but rain-squalls frequently occur with the southerly winds, and moderate gales and sandstorms, called 'dragons' in the popular language of the Arabs, are not uncommon.

The mean temperature of the surface water in the Red Sea varies at the northern end between about 65° and 79° F., in the central regions between 75° and 86°, and at the southern end between 78° and 89°; readings of over 100° have been recorded at the south end of the sea. The temperature of the water below the surface decreases down to a depth of about 200 fathoms, from whence down to the bottom a mean temperature of about 71° is found all the year round; this agrees with the temperature conditions prevailing in the enclosed seas of the East Indies, for instance, according to the observations made on board the *Challenger*, the depth at which the minimum temperature occurs (i.e. 200 fathoms in the Red Sea) indicating the depth of water over the barrier separating the Sea from the open ocean. In winter, in the northern part, the whole body of water from surface to bottom usually has a mean temperature of 71°.

The salinity of the water is almost constant at about 1·030 (ordinary ocean water is about 1·026), and this is due to the fact that no rivers flow into it, little rain falls, and the evaporation is excessive. It has been estimated that, were the Red Sea entirely enclosed, it would become a solid mass of salt in less than two thousand years, but this is prevented by an inflow of water through the Strait of Bab-el-Mandeb, and it is also known that a current of very salt water flows out underneath the incoming surface current.

The greatest depth in the Red Sea is about 1200 fathoms, and the mean depth of the whole area about 375 fathoms. From the point of greatest depth, which is near the centre, the bottom rises towards each end. Owing to the absence of rivers the deposits approach in character those formed in the open ocean, being largely composed of Foraminifera, Pteropods, and other pelagic shells. The marine fauna and flora are extensive, and have been described by Haeckel and other naturalists; it has been shown that a migration of the Red Sea and Mediterranean faunæ is taking place along the Suez Canal. The origin of the name—the Lat. *Mare Rubrum* and the Gr. *Erythra Thalassa*—is much disputed. The Hebrew name is *Yam Sûph*, which Gesenius explains as the 'sea of reeds.' The path by which the Israelites went out of Egypt was along the course of the valley called Wâdy Tumeilât, apparently an old arm of the Nile now silted up. The Lake of Ismailieh (*Timsah*) was then most probably the head of the Gulf of Suez, but the exact point of passage of this arm of the sea still remains obscure.

Redshank. See SANDPIPER.

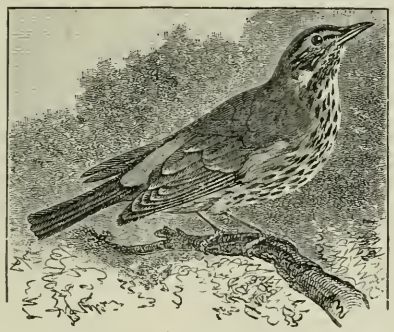
Redstart (*Ruticilla phœnicura*), a bird of the family Sylviidæ, ranging in Europe from the North Cape to the wooded regions of central and southern Europe; in Asia to the valley of the Yenesei in summer, and to Palestine, Arabia, and Persia in winter; in Africa from the Canaries and Madeira and Senegal to Abyssinia in winter. In Great Britain it is a summer visitor to most parts, though unaccountably absent from some; in Ireland it has been very seldom recorded, but since the summer of 1885 it has nested annually at Power's Court, County Wicklow. The male is about 5¼ inches long, has the head, back, and wing-coverts slate-gray; the forehead and eye-streak white; chin, throat, and cheeks jet black; wings brown, with pale outer edges; the tail and upper tail-coverts bright rufous chestnut; the rest of the under parts buff; bill black; legs and feet brown. The female has the upper parts grayish brown, under parts lighter, the tail less brilliant, and no bright colours on the head. The redstart is a bird of lively manners. Its food consists of flies, gnats, small

Redstart (*Ruticilla phœnicura*).

butterflies, and other insects; the young are fed largely on caterpillars. The nest is built of moss and dry grass, lined with hair and feathers, in holes in trees or walls; the eggs are usually six in number, and of a light blue colour. The song is slight, but soft and melodious; the alarm note is a plaintive *wheet*. In some parts of the country this bird is called the 'Fire-tail,' *start* being derived from the Anglo-Saxon *steort*, 'a tail.' The Black Redstart (*R. titys*) is now a well-known visitor to many parts of the English coasts, especially of Devon and Cornwall, in autumn and winter, and also to the east and south coasts of Ireland. It is more rare in Scotland, but it has been found as far north as the Pentland Skerries. It has been recorded in Iceland, the Faroes, southern Scandinavia, and Denmark. From Holland southwards it is abundant in spring. Its home is in southern Europe and northern Africa, whence it ranges eastwards to the Ural Mountains, Palestine, and Nubia. Other species of redstart are found, one (*R. mesolerea*) in Cyprus, Asia Minor, and Persia; another (the Indian Redstart, *R. rufiventris*) from Lebanon eastward; and a third (*R. ochrurus*) in the Caucasus and Armenia.

Red Water. See BLACK WATER.

Redwing (*Turdus iliacus*), a species of Thrush (q.v.), well known in Britain as a winter bird of passage. It spends the summer in the northern parts of Europe and Asia; it occurs in Iceland, and straggles even to Greenland: its winter range extends to the Mediterranean, Persia, Northern India, and Siberia as far as Lake Baikal. In size it is somewhat smaller than the song-thrush or mavis. Its flight is remarkably rapid. The general colour is a rich clove-brown on the head, upper parts of the body, and tail; the wing-feathers darker, but with lighter external edges; the lower parts mostly whitish, tinged and streaked with



Redwing (*Turdus iliacus*).

brown; the under wing-coverts and axillary feathers bright reddish orange. The redwing arrives in Britain rather earlier than the Fieldfare (q.v.), and, like it, congregates in large flocks, but is less numerous and less gregarious. Its food consists of insects, small snails, and berries. It has an exquisite, clear, flute-like song, which it pours forth from the summit of a high tree, gladdening the woods of the north.

Redwood. See PINE.

Ree, LOUGH, a lake in the centre of Ireland, between Connaught and Leinster, is an expansion of the river Shannon (q.v.).

Reed, the common English name of certain tall grasses, growing in moist or marshy places, and having a very hard or almost woody culm. The Common Reed (*Phragmites communis*, formerly *Arundo Phragmites*) is abundant in Britain and continental Europe, in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The culms are 5 to 10 feet high, and bear at the top a large, much-branched panicle, of a reddish-brown or yellowish colour, having a shining appearance, from numerous long silky hairs which spring from the base of the spikelets. The two outer glumes are very unequal; and the spikelet contains 3 to 4 perfect florets, with a barren one at the base. The culms, or stems, are used for making garden-screens, for light fences, for thatching houses and farm-buildings, for making a framework to be covered with clay in partitions and floors, for battens of weavers' shuttles, &c. So useful are reeds in these ways, and particularly for thatching, that it is found profitable in some places to plant them in old clay-pits, &c. Probably they might be planted with advantage in many peat-mosses where they are now unknown. The plant is not very common in Scotland; but in the fenny districts of the east of England it covers large tracts called *reed-ronds*, and similar tracts occur in many parts of Europe. Nearly allied to this is *Arundo donax*, the largest of European grasses, plentiful in the south of Europe, and found in marshy places as far north as the south of the Tyrol and of Switzerland. It is 6 to 12 feet high, and has very thick, hollow, woody culms, and a purplish-yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarionets, mouth-pieces of oboes, &c. They are also made into walking-sticks and fishing-rods; and see the article WRITING. The creeping roots contain much farina and some sugar. Of *Arundo Karka* (called *Sur* in Sind) the flower-stalks are very fibrous; and the fibres, being partially separated by beating, are twisted into twine and ropes. The Sea Reed is *Ammophila* (q.v.)—or *Psamma—arundinacea.*

Reed, in Music, the sounding part of several instruments, such as the clarionet, bassoon, oboe, and bagpipe, so called from its being made from the outer layer of a reed (*Arundo sativa* or *donax*) found in the south of Europe. The name is also applied to the speaking part of the organ, though made of metal. Reeds are generally divided into two kinds—the *beating* reed, used in the organ, clarionet, &c., requiring to be placed within a tube to produce a musical sound, and the *free* reed, used in instruments of the harmonium and concertina kind. The Organ (q.v.) reed (fig. 1) consists of a metal tube, *a*, with the front part cut away and having a metal (brass, German-silver, or steel) tongue, *b*, covering the orifice, attached at the upper end, and bent forward at the lower end to permit of vibration. The admission of a current of air to the outer tube causes the tongue to vibrate against the edge of the opening in the tube *a*, producing a musical note, the pitch of which is determined by the length of the free end of the reed;

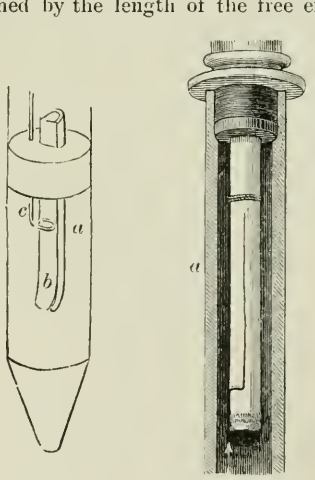


Fig. 1. Fig. 2.

this is regulated by a strong movable spring, *c*, pressing against it, the quality of the sound depending on the length and form of the outer tube. In the Clarionet (q.v.) reed the mouth forms the outer tube. The reed in the drone of the bagpipe is on the same principle as the organ reed, and is made of a piece of reed tube a few inches long, cut across a knot at one end so as to make a stop. A slit is cut in it with a knife to make the tongue. It is shown in fig. 2, *a*, *in situ*, the outer tube being shown in section; the air enters from the bag in the direction of the arrow, the free end is the stopped one. The double beating reed (fig. 2, *b*) is that used in the bassoon, oboe, and the chanter of the bagpipe, and consists of two reeds, shaped so as to be tied together in the form of a tube at one end, either with or without the aid of a metal pipe, to fit the end of the instrument, and thinned away at the other end, where the two meet with a little space between them in the

centre. The air being blown into the thin end causes the two reeds to vibrate against one another. The free reed, shown in fig. 3, consists of a metal tongue, *b* and *c*, fixed at one end to a metal plate, *a*, having an elongated slot large enough to allow the free end of the tongue to vibrate through it on the admission of a current of air; and this vibration forms the note, the pitch of which is regulated by the length of the reed.

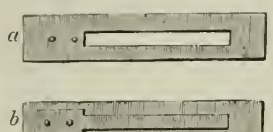

Fig. 3.

Reed Bird, Reed Mace, Reed Warbler. See Bob-o-link, Bulrush, Warbler.

Reef. See Coral.

Reel, a lively dance, popular in Scotland, which may be danced by two couples, but admits a greater number. The music is in general written in common time of four crotchets in a measure, but sometimes in jig time of six quavers.

Reels. See Bobbins.

Rees, Abraham (1743–1825), a native of Montgomeryshire, and Unitarian minister for forty years at the Old Jewry, London, compiled an Encyclopædia (q.v.) on the basis of Ephraim Chambers'.

Reeve (Sax. *geréfa*), a title applied to several classes of old English magistrates over various territorial areas: thus, there were *borough-reeves*, over boroughs; *port-reeves*, in trading-towns, in ports, as in London (q.v.); *high-reeves*, &c. The Sheriff (q.v.) is the *shire-reeve*. The reeve in Chaucer is what is still called *grieve* in Scotland, a land-steward.

Reeve, Clara, novelist, daughter of the rector of Freston in Suffolk, was born at Ipswich in 1729, lived a quiet life, and died unmarried, 3d December 1807. She translated Barclay's *Argenis* (1772), and in 1777 published the *Champion of Virtue, a Gothic Story*, renamed next year *The Old English Baron*. It was dedicated to Richardson's daughter, and was avowedly an imitation of Walpole's *Castle of Otranto*, with its extravagances toned down. She published four other novels, and *The Progress of Romance* (1785).

Reeves, John, was born in 1752, and educated at Merton College, Oxford. Called to the bar about 1780, he became chief-justice of Newfoundland (1791–92), one of the king's printers (1800), a superintendent of aliens (1803–14), and law clerk to the Board of Trade, and died in 1829. He published much on law, and a widely popular edition of the Bible, with selected scholia (9 vols. 1825).

Reeves, John Sims, one of England's greatest singers, was born at Shooter's Hill, Kent, on 26th September 1818. At fourteen he was a clever performer on various instruments, and was appointed organist and director of the choir in the church of North Cray in Kent. He first appeared in public as a baritone at Newcastle in 1839. This début was a complete success; and he acquired fresh fame, but as a tenor, in London. In order to perfect his voice and style he studied at Paris (1843) for some time, and then appeared at Milan in the tenor part of Edgardo in *Lucia di Lammermoor*. He returned to England in 1847, and, coming out at Drury Lane as Edgardo, was immediately recognised as the first English tenor, a position he maintained for many years. He was engaged in 1848 at Her Majesty's Theatre, and in 1851 sang as first tenor at the Italian Opera in Paris. After ceasing to sing on the stage (after 1860) he became popular all over the country as a ballad-singer at concerts. He especially excelled in singing oratorio parts, his first oratorio rôle having been in *Judas Maccabæus* in 1848; from that year onwards he sang almost regularly at the great annual musical festivals. He sang until 1891, and died 25th October 1900. On 11th May 1891 he made 'positively his last appearance.' See Life by Sutherland Edwards (1881), and *My Jubilee*, by Sims Reeves (1889).

Refectory. See Monastery.

Referendum. See Switzerland.

Reflection. A surface on which a beam of light falls may be either rough or smooth. If it be rough, the greater part of the incident light is irregularly scattered by the innumerable surface-facets, so as to be reflected or dispersed in all directions; if it be smooth, a proportion (but never the whole) of the incident light is regularly reflected or turned back in definite paths. A smooth, dustless mirror is not visible to an eye outside the track of rays reflected from it. If the polished surface be that of a transparent substance (e.g. glass) optically denser than the medium conveying the light to it, comparatively little light is reflected; but the more oblique the incidence, the smoother the polish, and the greater the difference between the optical density of the glass and that of the medium in which it is immersed, the greater the proportion reflected. Thus less light is reflected from glass under water than from glass in air; and conversely, if the light travel in the denser medium and strike the bounding surface between it and a rarer medium—as where light ascending through water strikes its upper free surface—it will, if its obliquity of incidence exceed a certain limit, be almost totally reflected; the small loss that ensues arising wholly from absorption, while no light is transmitted into the air above. This may be shown by holding a clear tumbler of water above the head: the image of objects beneath is seen reflected in a bright mirror surface; and a phenomenon of the same order is seen on thrusting a test-tube containing air below the surface of water, when it will appear to have a lustre like quicksilver. If the reflecting surface be that of an opaque body the bulk of the incident light is reflected, a percentage being lost by absorption. What has been said about light applies equally to ether-undulations of all kinds, and therefore the theory of reflection has general reference to radiant heat, light, actinic radiation, and electro-magnetic undulations (see Magnetism). Reflection arises in all cases from a difference in the transmissibility of ether-disturbances on the two sides of the bounding surface.

On reflection from polished surfaces we have, so far as regards the directions of the reflected rays, the following laws observed: (1) The incident 'ray,' the normal (*i.e.* a line drawn perpendicular) to the surface at the point of incidence, and the reflected 'ray' all lie in one plane, the 'plane of incidence;' and (2) the angle of incidence (the angle which the incident 'ray' makes with the normal to the reflecting surface) is equal to the angle of reflection (the corresponding angle between the normal and the reflected 'ray'). These laws apply equally to ether-waves of all lengths, and therefore to light of all colours; and they also hold good whatever be the shape of the surface. If the surface be plane their application is simple; and if the surface be curved we have, in effect, to consider the curved surface as made up of indefinitely small facets, to each of which the above laws can be applied. The geometrical consequences of these laws make up what used to be called Catoptrics, that part of geometrical optics which deals with reflection; and this coincides in its propositions

with that part of kinematics which gives an account of the reflection of waves. Here the ether-waves (using the term 'waves' in its most general sense) are assumed to travel through optically homogeneous media, and can consequently be traced out by imaginary lines drawn at right angles to the wave fronts or along the directions pursued by the waves, these imaginary lines being called 'rays.'

Plane Reflecting Surfaces.—(1) Rays which are parallel to one another before striking a plane reflecting surface are parallel after reflection. (2) If light diverging from or converging towards a point, Q, be reflected from a plane mirror, it will appear after reflection to diverge from or converge towards a point, q, situated on the opposite side of the mirror and at an equal distance from it. In fig. 1, the rays diverge from Q; after reflection they appear to diverge from q. If, on the other hand, the course of the light is such that the rays appear before reflection to converge upon q, they will after reflection actually pass through Q. (3) A consequence of the preceding proposition is that when an object is placed before a plane mirror the virtual image is of the same form and magnitude as the object, and at an equal distance from the mirror on the other side of it. The right hand of the image, taken as looking towards the mirror, is necessarily opposite to the left hand of the object; so that no one ever sees himself in a single plane mirror as others see him or as a photograph shows him, but he sees all his features reversed. (4) When two mirrors are placed parallel to one another, light from an object between them is reflected back and fore, so as to appear on each occasion of reflection as if it came from images more and more remote from the mirrors. On each occasion the course of the rays of light is the same as if the virtual image behind the mirror had been a real object; and a new virtual image is produced, apparently as far behind the reflecting mirror as the virtual object had been in front of it. Thus, in fig. 3, where AB and CD are mirrors, the distance Q-CD = CD-$q1$; $q1$-AB = AB-$q2$; and so on indefinitely; and also Q-AB = AB-q'; q'-CD = CD-q''; and so on indefinitely; so that if the mirrors were perfectly plane and parallel, and if they reflected all the light which fell on them, an observer between the mirrors would see in this experiment (which is called the endless gallery) an indefinite number of images. A variation of this experiment, carried out with mirrors not parallel to one another, but inclined at an angle which is some aliquot part of 180°, gives the principle of the Kaleidoscope (q.v.). (5) When a beam of light is reflected from a mirror and the mirror is turned through a given angle the reflected beam is swept through an angle twice as great. This principle is utilised in the construction of many scientific instruments, in which the reflected beam of light serves as a weightless pointer, and enables us to measure the deflection of the object which carries the mirror. (6) When a beam of light is reflected at each of two mirrors inclined at a given angle the ultimate deviation of the beam is (if the whole path of the light be within one plane) equal to twice the angle between the mirrors; for example, in fig. 4, the angle SDB, which measures the ultimate deviation of the original beam SA, is easily proved equal to twice the angle BCA between the two mirrors. This proposition is applied in the Quadrant (q.v.) and Sextant (q.v.). (7) When a wave of any form is reflected at a plane surface it retains after reflection the form which it would have assumed but for the reflection, this form being, however, guided by reflection into a different direction.

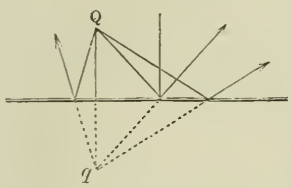

Fig. 1.

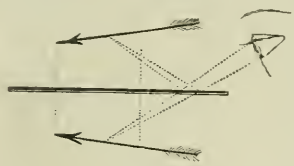

Fig. 2.

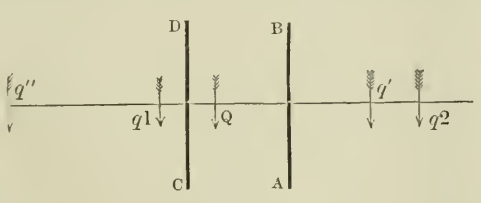

Fig. 3.

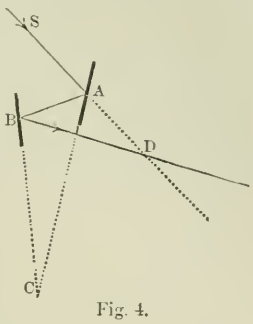

Fig. 4.

Curved Reflecting Surfaces.—In these we have to trace out the mode of reflection of incident rays from each 'element' or little bit of the reflecting surface; and this leads, through geometrical working, to such propositions as the following: (1) Parallel rays, SP, travelling parallel to the axis of a concave paraboloid mirror (fig. 5) are made to converge so as all actually to pass accurately through F, the geometrical *focus* of the paraboloid; and, conversely, if the source of light be at F, the rays reflected from the mirror emerge parallel to one another—a proposition of great utility in lighthouse work, search-lights, &c. (2) If the paraboloid mirror be convex, parallel incident rays have, after reflection, the same course *as if* they had come from the geometrical focus of the paraboloid. (3) In a concave ellipsoid mirror, light diverging from one 'focus' of the ellipsoid is reflected so as to converge upon the other 'focus' of the curved surface; and by a convex ellipsoidal mirror light converging towards the one focus is made to diverge as if it had come directly from the other focus. (4) In a hyperboloid reflector the two geometrical foci have properties corresponding to those of the ellipsoid. (5) In spherical reflectors, which are those most easily made, there is no accurate focus except for rays proceeding from the centre and returning to it. When parallel rays are incident on a

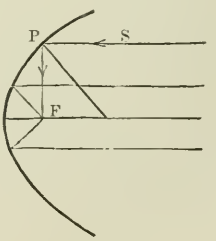

Fig. 5.

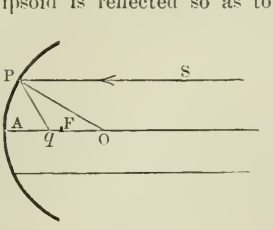

Fig. 6.

concave spherical mirror we see from fig. 6 that if they be parallel to the axis of the mirror each ray is made to pass after reflection through a point, q, which is nearer to F (a point midway between the mirror and its centre, O) the narrower is the pencil of rays. If, therefore, the pencil of rays be very narrow in comparison with the radius, OA, the rays will after reflection approximately converge upon F, which is called the principal focus of the mirror; and the principal focal distance, $AF = \frac{1}{2}AO = \frac{1}{2}r$, where r is the radius of the spherical mirror. The farther any ray is from the axis AO, the farther from F is the point, q, to which that ray is reflected; and the difference, Fq, is called the longitudinal aberration for that ray. The reflected rays from the various parts of the mirror form by their intersection a Caustic (q.v.), the apex or cusp of which is at F. If, instead of using a parallel beam of incident light, we have light coming from a point at a definite distance along the axis, we find (see fig. 7) first that any ray from Q to A travels back along AO, whence the focus of reflection is somewhere in the line AOQ; and that any ray, QP, is reflected to a point, q, such that the angle $QPO = qPO$; and therefore (since by Euclid, vi. 3, $QO : qO :: QP : qP$) if the pencil be relatively very narrow, so that QP comes to be equal to QA, and qP to qA, we have $QO : qO :: QA : qA$. This proportion reduces to the equation $1/Aq + 1/AQ = 2/AO$; whence we can readily find Aq when AQ and AO are known. Thus, if, for example, the radius of curvature AO be 12 inches (the principal focal length being then 6 inches), and if Q be 30 inches from A, we have $1/Aq + 1/30 = 2/12$; whence $1/Aq = 8/60$ and $Aq = 7\frac{1}{2}$ inches. The same formula may be written $1/d + 1/d' = 1/f$, where d and d' are the distances from A of the two 'conjugate' foci, q and Q, and f is the principal focal length. The two 'conjugate' foci are reciprocal; if light start from q it will be reflected to Q. As Q, the source of light, approaches O, q also approaches O; when Q is at O, q also is at O; as Q continues to move towards F, q moves out more and more rapidly beyond O; when Q is at F, q is at an infinite distance, or the reflected rays are parallel; when Q is between F and A the reflected rays are divergent, as if from a virtual focus on the opposite side of A. If the mirror be convex, fig. 8 shows that AO and AQ have, with respect to the reflecting surface, opposite signs; so also have AO and AQ; so the equation above becomes $1/Aq + 1/AQ = -1/AO$; whence, taking the same numbers as before, Aq is equal to -5 inches; a virtual image, seeming to come from a point 5 inches on the other side of the reflecting surface.

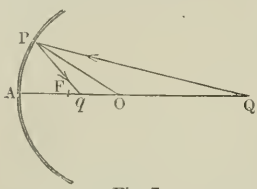

Fig. 7.

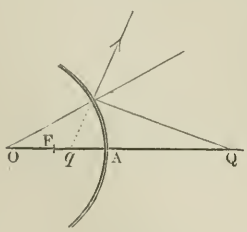

Fig. 8.

As to the quality of the light reflected there are some peculiarities to be observed. From the surface of a transparent body, of greater optical density than the surrounding medium, light polarised in the plane of incidence and reflection is more largely reflected at oblique incidences than light polarised at right angles to that plane; when the angle of incidence is such that the reflected and refracted rays tend to be at right angles to one another, the whole of the light reflected is polarised in the plane of incidence and reflection; and if light polarised at right angles to that plane be made to fall upon glass at the particular angle of incidence just referred to, it will not be reflected at all, but will wholly enter the glass. Plane-polarised light polarised in any other plane than that of incidence or one at right angles to it, is, after total reflection in glass, found to be elliptically polarised (see POLARISATION); and this phenomenon is always presented in reflection from metals. In the case of electro-magnetic radiation (see MAGNETISM) theory and practice concur in indicating that conductors are good while non-conductors are bad reflectors; and the same general proposition holds good with reference to those more frequent but otherwise similar ether-oscillations to which the phenomena of Radiant Heat, Light, and Actinism are due.

Reflex Action. See NERVOUS SYSTEM.

Reform is a comprehensive name for those changes in the law by which the House of Commons has been made a truly representative body. In the 18th century only freeholders voted in English county elections; in many boroughs the franchise was restricted to members of the corporation; boroughs of this class were usually under the influence of the crown or of some wealthy individual who regarded them as a part of his property. In 1745 Sir F. Dashwood moved an amendment to the address, claiming for the people the right to be freely and fairly represented; in 1766 Lord Chatham took up the cause of Reform; Wilkes proposed an excellent scheme of redistribution in 1776; in 1780 the Duke of Richmond proposed annual parliaments, universal suffrage, and equal electoral districts; but his plan met with no support. Pitt entered public life as an avowed reformer, and in 1785 he introduced a measure of redistribution; the part of his scheme most open to objection was the proposal to compensate owners of rotten boroughs. His bill was rejected, and he dropped the subject. The king was opposed to change, and in the public mind reform came to be identified with the revolutionary opinions which were beginning to prevail in France. Fox and Grey kept alive the demand for a wider franchise and a better distribution of power; and after the lapse of years the Whig friends of reform found an able leader in Lord J. Russell. His first motion on the subject was proposed in 1820, and in 1830 he accepted office under Lord Grey. A Reform Bill was brought in, and the second reading was carried by a majority of one. A subsequent defeat in committee compelled the government to dissolve. The country declared unmistakably for Lord Grey; his second Reform Bill was passed in the Commons by a large majority. It was rejected by the Lords, and the same fate would have befallen a third bill introduced in 1832, but the resistance of the Lords was overcome by the threat to create as many new peers as might be necessary to pass the bill. After something like a century of discussion the first Reform Act received the royal assent. The greater part of the labouring classes were still unenfranchised; the Radical reformers were still unsatisfied; but the Whigs and Tories were unwilling to disturb the settlement of 1832. Agitation was stimulated by the so called People's Charter put forth in 1838; but it was not till 1852 that Lord J. Russell reopened the question of Reform. Successive governments continued to bring in abortive schemes, until at last in 1867 Lord Derby and Mr Disraeli succeeded in passing the act by which household and lodger franchises were extended to the boroughs. In 1884 Mr Gladstone proposed to assimilate the franchise in counties to

that which had been given to the boroughs; but the Lords refused to pass any bill for extending the franchise until the details of the government scheme of redistribution were before them. The action of the Lords led to considerable agitation in the autumn recess. The bill was re-introduced in an autumn session; and the question at issue between the two Houses was settled by a very remarkable act of compromise. The government agreed not only to communicate their plan of redistribution to the leaders of the opposition, but to settle the details by mutual arrangement; Lord Salisbury and Sir S. Northcote attended meetings of the cabinet, and conferred with ministers for that purpose. The results of this conference were embodied in a series of bills which were passed into law before the general election of 1885. Two points in the measures of 1884–85 have been somewhat severely criticised—the adoption of single-member districts, a mode of distribution which suppresses the opinions of all local minorities (see REPRESENTATION), and the addition of twelve members to the House of Commons, which was already too large a body for deliberative purposes.

At the end of the reign of George III. there were, in a population of 22,000,000, only 440,000 voters. The Reform Bill of 1832 added less than 500,000 voters to the electorate; the reform of 1867–68 increased the electorate from 1,136,000 to 2,448,000. At the passing of the measures of 1884–85 the electorate had by natural growth risen to about 3,000,000; and the Act of 1884 added at once about 2,000,000 more to the list of voters. Of the new electors, about 1,300,000 were in England and Wales, 200,000 in Scotland, and 400,000 in Ireland.

Reformation. The religious revolution of the 16th century, known as the Reformation, is the greatest event in the history of civilisation since Paganism gave place to Christianity as the faith of the leading nations of the world. It marks the supreme importance of this revolution that the age which preceded and the age which followed it belong to two different phases of the human spirit. With the Reformation begins what is distinctively known as *Modern Europe*, while the epoch that preceded it bears the equally distinctive designation of the *Middle Ages*. As a revolution in which all the countries of western Europe were more or less directly involved, the subject of the Reformation has necessarily been treated in the different accounts of these countries. In the articles on Luther, Charles V., Henry VIII., Calvin, Knox, and others further details will be found regarding the aims and methods of the revolution in the various countries where it declared itself. Here, therefore, it will be sufficient to indicate briefly the general causes which produced it, the special course and character it took among the different peoples, and its chief results for the human spirit at large.

The central fact of the Reformation was the detachment from papal Christianity of the nations distinguished by the general name of Protestant. By this severance an order of things came to an end under which Christian Europe had been content to exist from the close of the 8th century. From the year 800, when, by a mutual understanding of their respective functions, Charlemagne was crowned emperor of the Romans by Pope Leo III., western Europe had come to regard the papacy as the essential condition of individual and corporate life, as prime a necessity in human affairs as the sun in the course of nature. Thus conceived, the power of the church underlay all human relations. It was the consecration of the church that constituted the family; the church defined the relations of rulers and their subjects, and the church was the final court of appeal on the ultimate questions of human life and destiny. In the nature of things such a power could never be realised as it was ideally conceived. Yet during the 11th and 12th centuries, the period when the power of the popes was most adequate to their claims, they undoubtedly went far to make the idea a reality. But the energies of the human spirit were bound sooner or later to issue in developments with which mediæval conceptions were fundamentally irreconcilable. By the 13th century, along every line of man's activity, there were already protests, conscious and unconscious, against the system typified in the pope at Rome.

The most remarkable of these protests was the order of ideas associated with the name of Joachim of Flora in Calabria (died 1202). Under the name of the 'Eternal Gospel' (used for the first time in 1254) these ideas ran a course which for a time seriously threatened the existence of the mediæval church. The new teaching struck at the very root of the papal system, for its essence was that the hour had come when a new dispensation, that of the Holy Spirit, should supersede the provisional gospel delivered by Christ. During the second half of the 13th and the first half of the 14th century the influence of these ideas is traceable in every country of Christendom, and it was only the unflinching action of the church that postponed its disintegration for other three centuries. The numerous sects which either sprang from or were quickened by this movement speak clearly to the revolutionary fever that had seized on men's spirits and was impelling them to other ideals than the traditions of Rome. Mainly the offspring of the third order of St Francis, these sects swarmed throughout every Christian country under the names of Beguins, Beghards, Fratricelli, Flagellants, Lollards, Apostolic Brethren, &c., and everywhere spread discontent with the existing church. Even John Knox (in answer to a letter by James Tyrie, a Scottish Jesuit) claims Joachim of Flora as an ally in the work which it was the labour of his own life to achieve—the ruin of the papacy, and the promotion of what he deemed a purer gospel.

Simultaneously with this manifestation of revolutionary feeling there were tendencies in the sphere of pure thought in essential antagonism to the teaching of the church. The labour of the thinkers of the middle ages was to reconcile faith, as inculcated by religious authority, with human reason as they found it embodied in the accessible writings of Aristotle. In the 13th century, however, the Arabic texts of Aristotle, and notably that of the great commentator Averrhoes, made their way into the Christian schools, and thenceforward a leaven of scepticism was a present element in all the universities of Europe. As the result of the teaching of Averrhoes, a name of the most sinister import to every true son of the church, materialism and pantheism became common creeds among thinkers, and the notion spread even among intelligent laymen that Christianity was not the absolute thing the church had taught them to believe. In Dante's (died 1321) fierce exclamation that the knife is the one reply to him who denies the immortality of the soul we have the outburst of a passionate faith in presence of a widespread libertinism of thought.

But the most serious menace against the integrity of the papal system lay in the political development of Europe during the last three centuries of the middle ages. As the countries of western Europe became more and more individualised, their peoples grew every year into a fuller consciousness of distinct national interests and national ideals. While

this was the tendency of the various nations, the pope during these centuries gradually lost his position as the disinterested umpire of Europe, and sank into an Italian prince, with a temporal policy of his own which led him to seek allies among other potentates as they fell in with his own special ends of the moment. But such alliances naturally gave offence to the princes excluded from them, and led to a suspicious discontent with the Roman see, which, as was afterwards proved in the case of England, needed only the requisite occasion to flame into outright rebellion. The saying of Philip Augustus (died 1223)—'Happy Saladdin, who has no pope!'—expressed the feeling, which every century grew stronger, that the pope would become an impossible factor in European politics. To this feeling should be added the fact that, as the middle classes grew in intelligence and well-being, they looked with envy on the immense wealth of the clergy, and grumbled at the large sums that annually went to the coffers of Rome.

During the 14th and 15th centuries mediævalism gave every sign of an exhausted phase of human development. By the so-called Babylonish Captivity, when the papal residence was fixed for seventy years at Avignon (1305–76), and by the Great Schism (1378–1417), during which the spectacle was seen of first two and afterwards three popes claiming to be the vicars of God on earth, the papacy suffered a loss of prestige in the eyes of all Europe which it never afterwards fully recovered. It was the further misfortune of the church during this eclipse of its ancient glory that all spiritual life seemed to have gone out of every rank of its clergy. Testimonies from every country prove beyond question that by the end of the 15th century the clergy had become grossly unfit to be the spiritual guides of the people. The sources of intellectual life had equally failed wherever the old philosophy authorised by the church continued to be the subject of teaching and study. In the later half of the 15th century scholasticism had become the veriest trifling which ever engaged the mind of man. In all the interests of man's well-being, therefore, a renaissance was needed to evoke new motives and supply new ideals which should lift humanity to a higher plane of endeavour. Such a renaissance came, and fortunately the church did not prove equal to suppressing this second burst of life as it had suppressed that of the 12th and 13th centuries.

It was again in Italy that the new life first declared itself. While north of the Alps scholasticism reigned in all the schools, the movement known as the Renaissance (q.v.) had in Italy been in full course for above a century. In itself the Renaissance was as far as possible from leading men to higher ideals in religion; yet in two of its results it gave a direct impetus to the Reformation. Inspired by the life of antiquity, the humanism of the Renaissance paganised the church and quickened that moral disintegration which was the prime cause of the religious revolution. On the other hand, through its opening of men's minds by new studies and new measures of things, the Renaissance lightened the load of tradition, and made a new departure in the life of Christendom a less formidable conception. In Erasmus (1467–1536), who has always been regarded as a true nursing father of the Reformation, we clearly discern these two results of the revival of the ancient literatures. In so many words he states his grave fears lest the church should be wholly paganised by the universal imitation of classical modes of thought and speech; while his own unsparing criticism of the church and its traditions proves how much he owed to the so-called 'new learning.'

The very zeal with which the revival of antiquity was pursued in Italy was itself a countercheck to religious reform in the country that of all others needed it the most. All contemporary literature proves that during the later part of the 15th and the opening of the 16th century the court of Rome was as profoundly immoral as that of any of the heathen emperors had been in the same city. The spiritual claims of the papacy were the jest of ecclesiastics themselves. 'This fable of Christ,' a certain dignitary of the church is reported to have said in the Vatican, 'has been to us a source of great gain.' Among the Italian people, however, there was never the slightest indication of a national movement towards any serious breach with the papacy. The religious melodrama enacted by Savonarola at Florence (1489–98) never struck at the central ideas of papal Christianity; and Savonarola, besides, never like Luther or Knox woke a deep response in the national consciousness. While in Italy, therefore, there was no widespread religious quickening as in other countries of Christendom, there was no political reason such as elsewhere produced a breach with the papacy. For the Italian people the pope was not a foreign prince with temporal interests of his own conflicting with those of the nation at large. The different republics which partitioned the country might at times regard the pope as an enemy to their individual ambitions; but the nation as a whole was fully conscious of the honour of having the vicar of God in their midst, and as in the past they had stood by him against the emperors, so in the great religious revolution of the 16th century they also remained faithful to him throughout the gradual dismemberment of his spiritual dominion.

Of the countries north of the Alps Germany was the first to be widely influenced by that revival of learning which had its origin in Italy. In Germany, however, the new spirit wrought under fundamentally different conditions, and lighted the way to vastly different issues. There was every reason why Germany should lead the way in the schism from Rome. Outside Italy Germany was the country where every abuse of the mediæval church was seen in its grossest form. The ignorance and sensuality of the clergy, the scandalous sale of livings, the disproportionate papal exactions—all these evils came to be vividly realised by the quickened consciousness of the nation. Between Rome and Germany, moreover, an antagonism existed in the very conditions from which mediævalism had sprung. It was in virtue of the mutual understanding between pope and emperor that the church came to fill the place it did in western Europe. But almost from the first the interests of Rome and the empire had been in collision, so that pope and emperor came to be mere rivals for the first place among the western powers. It was natural, therefore, that in Germany Rome should be regarded with a jealousy and suspicion which might easily grow into irreconcilable hostility.

These workings of the national mind found intensified expression in the acts and writings of Martin Luther, who, with a genius and audacity which have given him a place among the moulders of man's destinies, proclaimed the need of a new departure in the religious life of humanity. In rejecting the traditional claims of the papacy Luther at the same time supplied a new principle by which, as he contended, a higher and truer life of the soul might be lived. By his doctrine of Justification by Faith Luther threw each individual on his own responsibility for the reason and life which is entrusted to him. Hitherto the deepest concerns of men had been inextricably bound up

with pope and priest, and in this had lain the essential principle of mediæval Christianity. By the new principle Luther made the pope no longer an indispensable factor in individual or corporate life, and thus initiated a new phase in the development of society. As was to be expected, this principle, so organic in its working, cleft the German nation in twain, and gave rise to a struggle which did not close till more than a century after the death of Luther himself. Luther's attack on the sale of indulgences (1517), the burning of the papal bull (1520), Luther's condemnation by the Emperor Charles V. at the diet of Worms (1521), his temporary triumph at the first diet of Spires in 1526 (the beginning of modern Germany, according to Ranke), the confession of the Protestant faith at Augsburg (1530), are the outstanding events in the contest closed by the peace of Augsburg in 1555, nine years after Luther's own death, but again renewed in the disastrous Thirty Years' War (1619–48), and finally settled by the peace of Westphalia (1648).

The religious revolt of Germany left no country of Christendom unmoved. Before the 16th century had closed the bulk of the Teutonic peoples had followed her example and broken with the papacy. Under one aspect, indeed, the Reformation may almost be regarded as a Teutonic revolt against the domination of the Latin races. Between 1525 and 1560 Denmark and Sweden, taking the occasion of a political revolution, both declared for Protestantism; and in 1581 the United Provinces definitively threw off their double allegiance to Spain and the pope. But it is more important to trace the course of the revolution in the great powers of the West.

In Spain heresy of all kinds had no chance of finding a home. In its terrible Inquisition, reorganised in 1478, it had an institution ready made for effectually dealing with all attempts at reform or revolution. Luther found followers in Spain as in other countries; but they were literally extinguished before their voices could be heard, and of all the great powers Spain profited least by the quickening spirit of the Reformation.

Much more interesting and important is the history of religious reform in France. Between 1520 and 1530, the period of Luther's greatest activity, both renaissance and reform found a firm footing in France, and so many circumstances seemed to favour the future of both that for a time it was doubtful with which side the victory would eventually lie. On the one side was the university of Paris, which throughout the middle ages had claimed for itself the right—denied to the pope himself—of sovereign decree on the truth or falsity of all religious doctrine. As its decrees had in every case the strenuous support of the parliament of Paris, the university was a formidable force to be reckoned with by every innovator in studies or religion. In 1519 Luther's dispute with Eck had been referred to the doctors of Paris for decision, and their judgment, delayed for two years, had been the unqualified censure of Luther's position. Thenceforward every advocate of the new religion, and they daily grew in numbers, especially among the middle class, both in Paris and in the provinces, was pursued by the unrelenting hate of the parliament and the university. On the other hand, the king (Francis I.), eagerly encouraged by his famous sister, Margaret of Navarre, who herself had strong Protestant leanings, was at first disposed to use the new religious movement as a weapon to his hand in his dealings with the court of Rome. In the end Francis saw that separation from Rome meant the disruption of the French nation, and after 1534 he resolutely set himself to the extermination of every heretic in his dominions. His son and successor, Henry II. (1547–59), carried out this policy with even greater rigour, but in spite of all efforts to suppress them the French Protestants grew into a body formidable alike by their position, wealth, and intelligence. The Huguenot wars, the Massacre of St Bartholomew (1572), and the Edict of Nantes (1598) are the outstanding events in this long struggle, which, involving political as well as religious questions of the first importance, threatened the very existence of France by suggesting to Philip II. the possibility of annexing the divided country as a province of Spain. By the Edict of Nantes the French Protestants attained a certain measure of religious freedom; by its revocation in 1685 Protestantism was stamped out of the country, and France thus deprived of the noblest elements in its society.

The religious revolution in Switzerland is second only to that of Germany in its direct influence on the subsequent fortunes of the European nations. In Switzerland we have the case of a double revolt from Rome springing from the same conditions, yet each having a character and an animating soul of its own. At Zurich, as early as 1519, and independently of Luther, Ulrich Zwingli, who, according to Ranke, combined in himself the best elements of renaissance and reform, gave rise to a movement which split the Swiss cantons into two hostile sections, and issued in the peace of Cappel (1531), which permitted to each canton the choice of its own form of faith. More important than the movement of Zwingli at Zurich is that associated with Calvin and Geneva. As in almost every other case of revolt, political considerations wrought with religious zeal in the breach of Geneva with Rome. Before 1530 the town had received the new religion from French refugees, who thus gave its peculiar character to the creed eventually associated with Calvin and Geneva. But it was in the successful effort of the town in throwing off the yoke of the Catholic Dukes of Savoy (1534) that it found itself forced to join the great Protestant schism, and to fashion a civil and religious polity compatible with an independent corporate life. It was in the accomplishment of this task that Calvin proved himself the great consolidator of the tendencies that underlay the Protestant movement. Inspired by Calvin, it was the pre-eminent destiny of Geneva at once to produce a reasoned civil and religious creed and a type of Christian believer that offered a solid front against the vast powers still at the command of the Roman see, and assured to Protestantism its own independent course in the history of mankind.

In 1532 the schism of England from Rome also became an accomplished fact. In this result had issued the negotiations of Henry VIII. with Pope Clement VII. for his divorce from Catharine of Aragon. But the view summed up in Gray's line, 'And gospel light first dawned from Bullen's eyes,' implies a totally inadequate recognition of the many forces that went to produce the English Reformation. The king's divorce was the mere occasion of what must sooner or later have been the only solution of England's relations with the popedom. In England all the forces, in greater or less degree, were at work which had produced the religious revolution in Germany. As in Germany, the church alike in its teaching and practice no longer represented the highest consciousness of the nation. It has of late been shown that its degradation was far from being so general or so complete as the official reports of Henry had seemed to prove; yet the state to which it had come was clearly such as to lend some countenance to the most drastic measures against it. By the end of the 15th century, also, the Renaissance, which was everywhere the solvent of tradition, had found its

representatives in England. Linacre, Groeyn, Colet, and Sir Thomas More were all men more or less emancipated from mediævalism, though none of them broke communion with Rome. Both More and Colet spoke their minds freely on the unworthy lives of the clergy: and the latter by his foundation of St Paul's School in 1510, and by his placing it under lay supervision, took a step of the highest importance in the direction of the new order. But it is in the political development of England that we find the adequate explanation of her final breach with Rome. For centuries the pope had come to be more and more regarded as a foreign prince, whose powers, as he claimed the right to exercise them over Englishmen and English property, were incompatible with English interests and English liberty. Moreover, by the date of Henry's accession the pope was a mere Italian prince, whose own interests led him to seek the support of the strongest arm. When Clement VII., therefore, declared against the divorce from Catharine, Henry regarded the decision not as the oracle of Christendom, but as the counsel of an earthly prince whose own interests left him no other alternative.

The breach with Rome was thus inevitable; but it still remained to be settled whether the old or the new religion should finally gain the English people. Henry himself to the close of his life professed to have broken with the old only in the one point of the headship of the church. In the reign of Edward VI. a clear departure was made from the doctrinal system of the ancient church; but the temporary reaction under Mary showed how strong a hold that system still possessed on the hearts of the people. When Elizabeth came to the throne in 1558 it was only her prudent policy that saved the country from the internecine divisions of France and Germany. Three parties were equally bent on realising their own conceptions of a religious settlement. The adherents of the old religion, who still probably made a half of the people, had not lost hope of a return to the old spiritual allegiance. Those who had renounced the papacy themselves made two distinct parties, each bent on ends so conflicting, that it was evident from the first that they could never work in common. The governing principle of the one party, from which eventually sprang the Church of England, was to minimise the differences between the old faith and the new, and as far as possible to maintain the continuity of the religious tradition in the country. The other, which drew its inspiration from Calvin and Geneva, and was afterwards known as the Puritan party, aimed at a root and branch rejection of papal Christianity as at once in the interest of what they thought a purer creed, and as the only safeguard against a return to the old constitution. It was owing to her politic handling of these conflicting parties that at Elizabeth's death England was of one mind regarding the question of the papal supremacy, and that the severance from Rome became a definitive fact in the development of the country. By happy turns of events, such as her excommunication by Pius V. in 1570, and by the extraordinary issue of the Spanish Armada in 1588, not only was the number of Catholics reduced, but such as still clung to the ancient faith thenceforward put their allegiance to their native prince before any claim of the Roman see. It was this final triumph of the Protestant revolution in England that saved the movement in all the other countries of Europe.

The triumph of the Protestant movement in Scotland is likewise a fact of the first importance in European history. In Scotland, from the very beginning of Luther's revolt, we find the presence of the same elements which elsewhere led to revolution. As in other countries, the Scottish clergy had lost the respect of the country. As early as 1525 Lutheran books were so widely read that an act of parliament was passed forbidding their importation. The very efforts of the church to stamp out the new heresy, as in the burning of Patrick Hamilton in 1528, and of George Wishart in 1546, served only to hasten the turn of affairs which it had dreaded. Jealousy of the wealth and political influence of the clergy disposed the nobility to throw in their lot with the party of revolution. When in 1559 Knox returned from his long sojourn abroad, his unflinching zeal and personal force supplied the momentum that was needed to complete a revolution already in full course: and in the following year Protestantism was formally established as the religion of the country. The consequences of this revolution extended far beyond Scotland. Had Mary on her return in 1561 found Scotland united in the Catholic faith, she would have commanded the destinies of England. Elizabeth could never have effected a religious settlement, and, with England paralysed, Protestantism could not have held its own against the united forces of Catholicism.

Thus, by the middle of the 16th century, it seemed as if the revolution must sweep all before it, and the papal system be as completely effaced by Protestantism as Paganism had been effaced by Christianity. At the beginning of the revolt the authorities of the ancient church did not fully realise that the forces arrayed against them menaced their very existence. When the true extent of the danger was realised the church displayed all the resources of an institution whose roots were in the very heart of Christendom, and which, alike by its traditions and by its special adaptations to the wants of the human spirit, appealed to the deepest instincts of a large section of all the peoples of western Europe. The Society of Jesus, founded in 1540, supplied an army of enthusiasts, whose policy and devotion saved Rome from dissolution. By the decrees of the Council of Trent (1545–63), inspired by the spirit and aims of the Jesuits, the church reaffirmed its traditional teaching, conceding nothing either to renaissance or reform; and a succession of popes during the later half of the 16th century carried out with a zeal worthy of the better ages of the papacy the policy marked out for them by the Jesuits. Through the disunion of the Protestants and the strenuous efforts of the papacy, the middle of the 16th century saw the tide of revolution checked; and in certain countries, more especially in Germany, the Jesuits even gained ground which had been lost. By the close of the same century Europe was portioned between the two religions almost by the same dividing lines as exist at the present day.

It has been said that the central fact of the religious revolution of the 16th century was the severance of the Protestant nations from the Roman see; but the great schism inevitably led to issues of which the Protestant reformers never dreamed, and which they would have denounced in as unqualified terms as any theologian of the mediæval church. The reform of religion preached by Luther or Calvin implied no real change in the modes of thought that distinguished mediævalism. Their theology was but another form of scholasticism; their attitude to the classical tradition or to any departure from their own conception of the scheme of things was precisely that of the Schoolmen trained on the Decretals and Aristotle. For an infallible church they substituted the Bible as the unerring expression of God's relation to man; the interpretation of the Bible they left to the indi-

vidual consciousness. This freedom was of necessity only nominal, since the members of any Protestant church were members only on condition of their accepting the church's interpretation of the contents of the Bible, and since each different church deemed itself the special depositary of the only true conception of the perfect will of God. Nevertheless, it was from this attitude of the Protestant reformers to the Bible that the developments of modern thought sprang. A reformer like John Knox would have stamped out every form of thought hostile to his own synthesis of things divine and human; but it was not in the power of the Protestant system to do what had been so effectually done by the church of the middle ages. In the mediæval conception church and state made one organism; what menaced the life of the one menaced the life of the other. Hence the state was at the church's bidding whenever its arm was needed to deal with any suggestion of heresy. But having no great central head, such an organic union was impossible for any Protestant church, and religious error could not be regarded as a crime against the existing government. So complete was the revolution wrought by this changed relation of church and state that toleration of different creeds, and not an iron uniformity, was in time seen to be the indispensable condition of civil society. But in this lies the fundamental distinction between mediævalism and the modern spirit. Mediævalism rested on the belief that society was threatened if any of its members questioned the body of truth of which the church was the custodier; it is the distinctive principle of the modern spirit that truth shall be followed wherever facts are believed to lead.

For authorities on the Reformation, see the articles in this work on the chief reformers, and those on RENAISSANCE, CHURCH HISTORY, ENGLAND (CHURCH OF), POPE, ROMAN CATHOLIC CHURCH. Here we simply enumerate certain important books along the lines of the foregoing article, and following its order of treatment. Bryce, *The Holy Roman Empire;* Renan, *Joachim de Flor et l'Évangile Éternel* ('Nouvelles Études d'Histoire Religieuse'), and *Averroès et l'Averroïsme;* J. A. Symonds, *The Renaissance in Italy;* Bishop Creighton, *A History of the Papacy during the Period of the Reformation;* Ranke, *Deutsche Geschichte im Zeitalter der Reformation;* Gieseler, *Lehrbuch der Kirchengeschichte* (vols. iv. and v. in trans. published by T. and T. Clark, under the title of *A Compendium of Ecclesiastical History*); Beard, *Life of Luther;* Köstlin, *Life of Luther* (a trans. of the abridged life is published by Longmans); Döllinger, *Die Reformation, ihre innere Entwickelung und ihre Wirkungen* (the most powerful statement from the Catholic point of view); Zeller, *Histoire d'Allemagne*, tome vii. (1891); M'Crie, *Reformation in Spain;* Michelet, *Histoire de France* (vols. ix.–xii.); Baird. *Rise of the Huguenots:* Bungener, *Calvin, sa Vie, son Œuvre, et ses Écrits* (1863); Kampschulte, *Johann Calvin* (vol. i. 1869); Burnet, *History of the Reformation* (in England); Strype, *Memorials of the Reformation;* Froude, *History of England* (first four vols.); Brewer, *Reign of Henry VIII.;* Dixon, *History of the Church of England from the Abolition of the Roman Jurisdiction;* Worsley, *The Dawn of the Reformation: Its Friends and its Foes;* Aubrey Moore, *Lectures on the History of the Reformation;* Lee, *Lectures on the History of the Church of Scotland;* Cunningham, *History of the Church of Scotland;* Grub, *Ecclesiastical History of Scotland;* Bellesheim, *History of the Catholic Church of Scotland* (vol. ii.—Hunter Blair's trans.). Seebohm's *Era of the Protestant Revolution*, though somewhat one-sided, is an excellent little handbook for the whole period.

Reformatories and Industrial Schools. When the time arrived that statesmen and reformers combined to study the causes of crime with the view to systematic efforts for its repression, it soon became evident that the most effective method would be to check the first development of it in the young. Close observers agreed in the fact that by far the larger number of habitual criminals commenced their malpractices before they were twenty years old, and nearly 60 per cent. when under fifteen. Hanging and imprisoning did not check the growth of the class of juvenile criminals. In the early part of the 19th century there were said to be in London two hundred flash houses frequented by 6000 boys and girls, who had no means of livelihood but thieving. Something had even at that time been done to provide a better mode of dealing with these young people. The Marine Society, for taking charge of friendless children and sending them to sea, dates from 1756. The Philanthropic Society's Farm School at Redhill was founded about 1788, and some other schools were no doubt established not long after this; but the first official attempt to solve the difficulty was the foundation of Parkhurst Reformatory, under an act of parliament passed in 1838. Previously to this it appears to have been the practice to grant pardons to young offenders on condition of their being placed under the care of some charitable reformatory institution, and the preamble of the act above named refers to this practice as having proved so beneficial that it was considered expedient to carry it more fully into effect. It made escape from these institutions or breach of their rules punishable, and converted the buildings at Parkhurst, lately used as a military hospital, &c., into a reformatory prison for young offenders sentenced to transportation or imprisonment. Parkhurst Reformatory was in fact a prison, though conducted according to a special system designed more with a view to reform than to punish.

In 1854 an advance was made by enabling courts to pass on a prisoner under sixteen years old a direct sentence of detention in a reformatory for not less than two or more than five years, in addition to imprisonment in gaol for not less than fourteen days. The reformatory was subject to inspection by an officer appointed by the Secretary of State, and the certificate of the Secretary of State was necessary to make it a legal place of detention. Treasury contributions towards the maintenance of the reformatory were authorised, and a compulsory contribution by the parent in relief of the Treasury charges. In 1857 another step was taken by enabling quarter sessions and borough councils to contribute to the establishment of a reformatory, providing that the plans were approved by the Secretary of State. These local authorities were also empowered to contract with other reformatories for the reception of juvenile prisoners from their jurisdictions. The authorities were by this act allowed to grant licenses on probation to the inmates of reformatories after at least half their sentence had expired. The effect of the Act of 1854 had been gradually to supersede Parkhurst, so that whereas in 1849 it had about 700 inmates, and in 1854 about 536, on the 31st December 1864 there were only 68: and it was therefore closed in that year. In the year 1866 the consolidated and amended act now in force was passed. It retained all the foregoing provisions.

A sentence to reformatory is restricted to those offenders who are under sixteen and not below ten years old, with the exceptions mentioned below. The sentence must be not less than two nor more than five years, but they must also be sentenced to ten days' previous imprisonment or more. A child under ten years may be sent to a reformatory only if he has been previously charged with an offence or sentenced by a judge or court of general quarter sessions. The reformatory to which a young person is to be committed is selected by the court which passes the sentence, but it must if possible be conducted according to the religious persuasion to which the child belongs, and there are securities

for its being removed to such school if not originally committed to it. The Reformatory Schools Act, 1899, amends the Act of 1893 in so far it gives magistrates power to send youthful offenders direct to a reformatory instead of in the first instance committing them to a term of imprisonment.

A reformatory may be established wholly by private individuals, or by quarter sessions in counties, or by town-councils in quarter sessions boroughs, or by private individuals with contributions from these local authorities, but the state provides no reformatories, and the local authorities are not obliged to do so. Plans of any buildings proposed to be used as a reformatory must be submitted to and approved by the Secretary of State. The rules of reformatories are made by the managers, but must be submitted to and approved by the Secretary of State. The expenses of maintaining the reformatory are met partly by private contributions, partly from local rates, partly from funds provided by the Treasury, and partly by payments exacted from the parents or guardians. By the report for 1890 of the inspector it appears that there were fifty-five reformatory schools in Great Britain, including three ships. Of these ten were in Scotland. There were seven in Ireland.

The growth of the reformatory system in Great Britain is shown by the following figures. In 1854 twenty-nine children were committed to reformatory schools in England; in 1857, 1304; in 1877, the largest number recorded—viz. 1896; and in 1890, 1299. The total population of the reformatory schools in Great Britain seems to have risen gradually until 1881, when it attained its maximum—viz. 6738; since which it has fallen gradually, and on 31st December 1890 there were under detention 5031 males and 823 females, or together 5854, of whom 4164 males and 737 females were actually in the schools, the remainder being mostly on license, but 52 had absconded or were in prison. The cost of these schools in the latter year was £119,336, of which £78,862 was provided by the Treasury, £5488 by the parents, £24,055 by local rates, £2793 by subscriptions and legacies, £799 by voluntary associations, and £2619 interest on investments and sundries. This leaves a balance of expenditure over receipts of £5519; and, as the inspector's report shows that there was a profit on industrial operations of over £13,416, it is presumed that the deficiency was supplied from that source. The net cost per head in 1890 after deducting profits of labour may be put at about £19 per annum, for both boys and girls in England. In Scotland the boys cost about £17 and the girls over £22. Testing the result of the reformatories and industrial schools by the committals of juvenile offenders to prison, it appears that, taking for comparison the number so committed in 1856—viz. 11,808—there were up till 1873 or 1874 more years in which the number was above 8000 than below it. Since the latter year it has fallen, until in 1890 there were only 3456 boys committed to prison in England and Wales. The young persons who commit crimes needing the punishment of detention in a reformatory are therefore evidently largely diminishing, a result which corresponds with the diminution in adult crime, with which it is so closely connected.

The industrial schools may be said to have grown out of the reformatory schools—the first act relating to and recognising them having been passed in 1854, since which their history much resembles that of the reformatories, the consolidating act which now regulates them having with that for reformatories been passed in 1866. Subsequent acts have much extended their scope, especially those which followed the establishment of compulsory education, and encouraged or enjoined school boards to establish and make use of them. Industrial schools are intended for children who have not been convicted of crime, and this is their distinctive note as compared with reformatories. A child must be under fourteen, and cannot be detained above the age of sixteen. The circumstances which justify a magistrate committing a child to an industrial school are—if he has been found begging, wandering without settled abode or proper guardianship and visible means of subsistence; who is destitute, an orphan, or having a surviving parent in prison; whose mother has been twice convicted of crime; who frequents the company of thieves, &c. If a child under twelve is charged with a punishable offence, but has not previously been convicted of felony, he may be sent to an industrial school; so also may a refractory child on the application of its parent or guardian; a refractory pauper child, or one either of whose parents has been convicted, may also be sent to an industrial school. The Education Act, 1876, requires the school authority to take steps to send all children to industrial schools who are liable to be sent for the above reasons, unless it is in any case inexpedient, and further requires it to apply to justices for orders compelling the attendance at school of children over five and under fourteen whose education is habitually neglected by their parents, and authorises the committal of such children to an industrial school.

Day industrial schools, in which, as their name implies, children can be trained and fed, but not lodged, were authorised by the same act. The mode in which an industrial school may be established is substantially the same as has been described for reformatories, but in addition the school authority has the same power as the prison authority. The provisions to ensure proper buildings and suitable rules, and as to inspection, are also similar in the two cases, and a child may be licensed from an industrial school as from a reformatory. So also are the provisions for meeting the expenses of these schools. The report for 1890 of the inspector of reformatory and industrial schools shows that there are now in Great Britain 141 industrial schools, including 8 ships, 10 truant schools for school board cases, and 19 day industrial schools. Of these 7 are established by county authorities, 1 by the corporation of Birmingham, and school boards manage 8, besides the truant schools and day industrial schools.

The development of these schools is shown by the number under detention in each year to be in the direction of steady increase. In 1864, 1668 children were under detention; in 1890 this had risen to 22,735. These figures include the truant schools, but do not include the day industrial schools, which commenced in 1879 with 287 scholars, and in 1890 had 3698. The number of admissions corresponds in steadiness of increase with the foregoing figures. In 1861, 608 boys and 400 girls were admitted; in 1862, 422 boys and 169 girls; in 1866, the year of the consolidated act, the numbers rose to 1444 boys and 539 girls; and in 1890 there were 3483 boys and 849 girls, besides 1510 to truant schools, and 2517 to day industrial schools. (A small deduction should apparently be made from these figures for transfers.) The foregoing figures giving the number under detention in various years are apparently to be taken to mean that these numbers were all under order of detention at the same time.

The cost of ordinary industrial schools in 1860 was £58,701. The year of highest cost was 1885, when it rose to £386,400. In 1890 it was £360,947. This includes truant schools. Of this latter the Treasury contributed £194,403; the rates, £42,198; school

boards, £67,936; the parents paid £16,656, and subscriptions provided £34,489. The cost of day industrial schools rose from £3272 in 1879 to £25,558 in 1890. Of this latter sum the Treasury found £6891; rates, £1071; school boards, £11,260; and parents, £3382. The total ordinary cost of a child in an industrial school ranges from £14 to nearly £18 per annum.

The statutes in force for regulating reformatory and industrial schools in Ireland differ somewhat from those in Great Britain, and in Ireland far more children in proportion to population are sent to industrial schools than in Great Britain, so that the Royal Commission in 1884 reported: 'It is certain that the certified industrial schools in Ireland are regarded as institutions for poor and deserted children rather than for those of a semi-criminal class, and the result of this feeling is that the managers of many of these institutions refuse to take children who have been found to have committed a criminal offence, and who might legally be convicted of that offence and sent to a reformatory. All taint of criminality having been removed from the schools, numbers of children are sent to them who do not always come under the provision of the act, and who are sent merely on the ground of destitution. There can be no doubt that many children are sent to the industrial schools in Ireland who would not be so sent in England; whilst in consequence of it it is to be apprehended that numbers of children who are proper subjects for these institutions are left on the streets as waifs and strays.' There were in Ireland, at the end of 1890, 816 children on the lists of the reformatory schools (a decrease as compared with the previous year), of whom 744 were actually in school. There were 8609 children on the rolls of the industrial schools (an increase on the previous year), of whom 7767 were actually in school—the remainder mostly on license. The reformatory schools in Ireland cost £17,190 in 1890, of which imperial taxes bore £11,890, local taxes £5518; and the industrial schools, £158,274, of which imperial taxes bore £93,842, local taxes £37,262, a decrease of cost compared with the previous year for reformatory schools, but an increase for industrial schools.

The most famous of the continental reformatories is that at Mettray, about 5 miles from Tours. The 'Colony,' as it is called, was established in 1839 by M. Demetz, a French magistrate and philanthropist, in conjunction with the Vicomte Bretignères de Courteilles. Its inmates, numbering 800—either orphans, foundlings, or delinquents—are taught and employed in agricultural and various industrial labours. The relapses into crime of those who have left the colony have amounted only to about 4 per cent. In the United States there are nearly fifty reformatories for juvenile offenders under the control of a state or city, with an average number of inmates exceeding 12,000; and the reformatory results attained are excellent. The New York House of Refuge, which dates from the year 1824, is the oldest in the country, and indeed was the first reformatory for juveniles in the world which was established by law and placed under legislative control. Destitute, abandoned, or neglected children, as well as delinquents, may be sent to the House of Refuge, and 'there be dealt with according to law'—i.e. detained, as a rule, until reformed or come of age. In American reformatories the inmates spend at least half their time in productive labour, but the whole course of treatment is distinctly educational. At Rochester, New York, the House of Refuge was in 1884 turned into a state industrial school, which proved so successful that it was gradually enlarged, and is now in effect a school of technology, where various trades are taught. The increased cost for each inmate is about $30 per annum.

Reform Club. See CLUBS, and L. Fagan's *Reform Club* (1887).

Reformed Churches, a term employed in what may be called a conventional sense, not to designate all the churches of the Reformation, but those in which the Calvinistic doctrines and still more the Calvinistic polity prevail, in contradistinction to the Lutheran (q.v.). The influence of Calvin proved more powerful than that of Zwingli, which, however, no doubt considerably modified the views prevalent in many of these churches. The Reformed Churches are very generally known on the continent of Europe as the *Calvinistic Churches*, whilst the name *Protestant Church* is in some countries almost equivalent to that of *Lutheran*. One chief distinction of all the Reformed Churches is their doctrine of the sacrament of the Lord's Supper, characterised by the utter rejection not only of transubstantiation, but of consubstantiation; and it was on this point, mainly, that the controversy between the Lutherans and the Reformed was long carried on. See LORD'S SUPPER, and SACRAMENT. They are also unanimous in their rejection of the use of crucifixes, and of many ceremonies retained by the Lutherans. Churches belonging to the Reformed group are those of England (in some respects) and Scotland, some churches of various parts of Germany, the Protestant Churches of France, the Netherlands, Switzerland, Hungary, Poland, &c., with those in America which have sprung from them.

See the articles CONFESSIONS OF FAITH, ARTICLES, PRAYER-BOOK, LUTHER, ZWINGLI, CALVIN, KNOX; and works on the distinctions between Lutheran and Reformed Churches by Schweizer (1856), Hagenbach (1857), Merle d'Aubigné (1861), Schneckenburger (1855).

Reformed Presbyterians. See CAMERONIANS.

Refraction. When a beam of light, travelling in a transparent medium, impinges obliquely upon the surface of another transparent medium, what occurs in the vast majority of cases is that a part of it is reflected (see REFLECTION) and a part of it enters the second medium, but in so doing is *refracted* or bent out of its former course. If, for example, the light travel in air and impinge obliquely upon glass, the course of the refracted portion is bent so that the refracted light travels more directly or less obliquely through the glass; and, conversely, if the light travel in glass and impinge upon an air-surface, the portion which is refracted into the air will travel through the air more obliquely with respect to the refracting surface than the original light had approached it. The law of refraction was discovered by Snell in 1621, and is the following: the refracted ray is in the same plane with the incident and the reflected ray, and is therefore in the *plane of incidence* (see REFLECTION); and the sine of the angle of incidence bears to the sine of the angle of refraction a ratio which remains constant, for any two media, whatever be the angle of incidence.

In fig. 1 a ray, AO, impinges on a denser medium at O; the angle of incidence is AON (ON being at right angles to the refracting surface); the refracted ray, instead of going on towards a', is bent so as to pass through A'. Draw a circle cutting AO and OA' in c and c'; draw cd and $c'd'$ at right angles to NN'; these lines, cd and $c'd'$, are, for the radius Oc, the *sines* of the respective angles AON and A'ON'. These sines bear to one another a certain proportion, ascertained by measurement; let it be 3 : 2; then Snell's law is that any other ray, say from B, will be so refracted that the sines, similarly drawn, will bear to one another the same proportion of 3 : 2. Between air and water the ratio of these sines is almost exactly 4 : 3; between air and

crown-glass it is nearly 3 : 2. Now observation shows that light passing from water into crown-glass is so refracted that the sines have the ratio $\frac{3}{2} : \frac{4}{3}$, or 9 : 8, so that the rays are less bent than when they pass from air into any of these media.

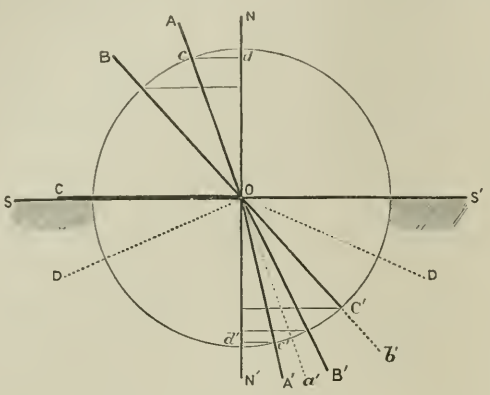

Fig. 1.

The ratio of these sines when *air* is one of the pair of media involved is called the *refractive index* of the other medium; thus, water has, for sodium monochromatic light and at 18° C., a refractive index of 1·3336, and crown-glass one of 1·5396; and the ratio of these refractive indices, ascertained with respect to air, governs the ratio of the sines, whether air be one of the pair of media experimented on or not. A direct consequence of this is that, if light pass successively, say, through air, glass, and water, the ultimate deviation will be the same as if the glass had been absent: and so for any number of intervening terms, it being always assumed that the bounding surfaces are parallel to one another; and if a parallel beam of light, passing through air, come to traverse any number of parallel refracting-surfaces, and if it regain the air, it will be found to travel parallel to, if not directly in, its original course.

The observed fact that light is differently bent in its course by different refracting media shows that there is a difference between bodies in their power of receiving light through their bounding surfaces. Newton, in accordance with his corpuscular theory (see LIGHT), interpreted this as showing that when the luminous corpuscles come very near the surface of a denser substance they are as it were jerked or made to swerve out of an oblique path and hurried in by the attraction of the denser substance so as to enter that substance more directly; and that when the light quits the denser substance it is retarded by a similar attraction. The consequence of this would be that light would travel in the denser medium perhaps not appreciably faster than in air, but with a mean velocity certainly not less. On the undulatory theory, however, refraction is a necessary consequence of a slower travel of ether-disturbances in the denser medium.

In fig. 2 A is a plane wave-front, advancing obliquely towards B, the surface of a denser medium. At the end of a certain time the wave-front is at A′; after an equal interval it is at A″. During the next equal interval a gradually diminishing breadth of the wave is traversing the original medium with the original velocity; but a steadily widening portion of the wave-front enters the denser medium and is there hampered. At the end of the interval the aggregate disturbance, that is to say, the wave-front, will be found to have swung round into the position and direction represented by *a*, just as a line of soldiers would tend to do on obliquely entering more difficult ground. During the next equal interval the wave-front advances parallel to itself, but traverses smaller distances in equal times, so that *aa′* is less than AA′. To this explanation it is essential that in optically denser media light should travel more slowly: and it has been absolutely established that this is the case. Optical density, so called, does not, however, always coincide with mass-density: bisulphide of carbon, which is lighter than glass, has for sodium light a refractive index of 1·63, while crown-glass has an index about 1·5, and flint-glass one about 1·6. If the course of any ray between any two points in the two respective media be studied, it will be found that no other path between the two points could have been traversed in so short a time.

If we go back to fig. 1, and assume the rays to pass from A′, B′, &c. towards O, we find the rays emerging from the denser medium more nearly parallel to SS′; a ray from C′, so far as it is refracted at all, emerges parallel to SS′; and for

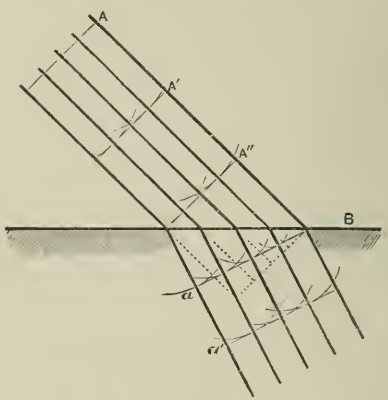

Fig. 2.

rays approaching O from points between C and S′ the construction for the refracted ray becomes impossible. The angle C′ON′ is the *critical angle*, beyond which there is no refraction, but total reflection (see REFLECTION). This angle is such that its sine is equal to $\frac{1}{\mu}$, where μ is the ratio between the refractive indices of the denser and the rarer medium. For water and air it is, for sodium monochromatic light, 48° 27′ 40″. Where this ratio μ (the 'relative index of refraction') is high, this critical angle is small and total reflection is well marked, as in the sparkle of the diamond.

When a spherical wave impinges on a plane surface it is modified into a hyperboloid, the centre of curvature of the central portion of which is farther away than or nearer than the centre of the sphere in the ratio of the refractive index of the second medium to that of the first. An eye within a rarer medium will thus see the image of a point situated within the denser medium as if it were nearer than it really is; hence a stick appears bent when partly immersed obliquely in water; and, owing to differences in the amount of refraction at different angles, the bottom of a tank looked down upon appears sunk in the middle.

In fig. 3 light starts from a point X, and impinges directly upon a spherical surface of a denser medium; the centre of curvature of the spherical surface is at C. During a certain interval of time the front of the wave advances from A′ to A; during the next equal interval it would, but for the denser

medium, have been at BRD. It has not, however, got so far as R in the time; the central part of the wave-front has only got as far as R′, where AR : AR′ :: μ : 1. Any non-axial ray, such as XP, which would have reached Q, can only have originated a disturbance at P, which would have travelled from P in some direction to a distance not equal to PQ, but to PQ reduced in the same

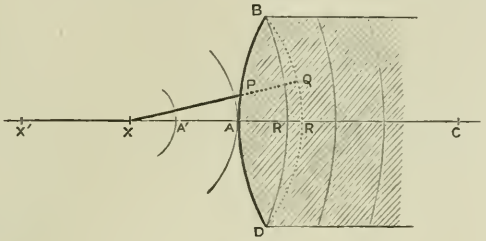

Fig. 3.

ratio of μ : 1. We might then, knowing μ, the relative index of refraction of the denser medium, draw, with centre P and radius = PQ ÷ μ, an arc of a circle; the disturbance will have got to some point on that circle. Doing the same for all the P's, we have a series of circular arcs which may be connected by a line drawn so as to touch them all. This line will be a curve; and it will, for some distance from the axis, coincide very nearly with the arc of a circle whose centre is at X′, so that the wave-front will travel in the denser medium approximately as if it had originally come from X′. The relation between the distances AX, AX′, and AC is given by the formula $\mu_1/AX' - \mu_0/AX = (\mu_1 - \mu_0)/AC$, where μ_0 is the refractive index of the original, and μ_1 that of the refracting medium. For example, let $\mu_0 = 1$ (air) and $\mu_1 = 1{\cdot}5$ (crown-glass); AC = 2 inches; AX = − 1 inch (i.e. the source of light is one inch to the *left* of A); then $1\frac{1}{2}/AX' + 1/1 = \frac{1}{2}/2$; whence AX′ = − 2, or the light travels in the denser medium as if it had come from a point 2 inches to the left of A. If the wave-front be plane as it approaches A, that is equivalent to AX = − infinity or $\mu_0/AX = 0$; whence AX′ is equal to + 6, or the light converges on a point in the denser medium 6 inches to the right of A. If, however, a plane wave-front approach A in the denser medium, that is equivalent to AX = + infinity; but, as the original medium is now the denser one, $\mu_0 = \frac{3}{2}$ and $\mu_1 = 1$; whence, by the formula, AX′ = − 4, and the convergence is on a point 4 inches to the left of A. These distances of the points of convergence for plane waves, at − 4 (= f) and + 6 (= f') from A, are the Principal Focal Distances for the curved surface and the media in question; and they bear numerically the same ratio to one another as the refractive indices do; from which, together with the previous equation, we get $-f/AX + f'/AX' = 1$; which shows, still keeping to our numerical example, that when the object lies at a greater distance than 4 inches to the left or 6 inches to the right of A, the image is a real one on the opposite side of A; whereas when it is at a less distance from A, X and X′ are on the same side of A, and the image is virtual. X and X′, thus determinable when one of them is known, are *conjugate foci;* and they are interchangeable, so that an object at either will produce an image, real or virtual as the case may be, at the other.

The refracting medium may not be of indefinite extent, but may be bounded in the path of the light by another surface. If this be symmetrical with respect to the first spherical surface we have a Lens (q.v.); and, by repeating our calculations of the refraction at the second surface as if the image produced by the first were itself an object, we arrive at the formulæ given in the article on LENSES.

If a parallel beam of light enter one plane surface and be there refracted and emerge by another which is not parallel to the first, we have the essentials of a *Prism.* Assume the incident light to be monochromatic; then fig. 4 shows the incident beam SP taking the course SPQR. The elements of the problem are, μ being the relative index of refraction of the prism: (1) μ sin QPn' = sin SPn; (2) μ sin PQn' = sin RQm; (3) angles QPn' + PQn' = angle A, by the geometry of the figure; and (4) angles SPn + RQm = angles A + $mn'n$, this last being the *Deviation* produced by the prism. These four equations contain seven terms; and it is sufficient to measure three of these, say the angles A, SPn, and $mn'n$, in order to ascertain the rest, including μ, the relative refractive index of the prism for the particular monochromatic light employed. If, however, the light employed be not monochromatic but mixed, as ordinary daylight, we find that the prism sends each wave-length—each colour-sensation-producing component of the daylight (see COLOUR)—to a different place, and thus produces a Spectrum (q.v.). Each wave-length has its own μ and its own deviation; the more rapid, shorter waves being the more refrangible by a given piece of glass.

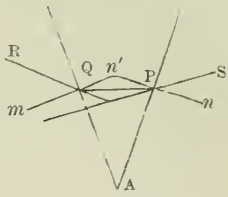

Fig. 4.

If in fig. 4 the prism be turned so that S and R lie symmetrically with reference to the angle A, the deviation is then a minimum; and in that position of minimum deviation a monochromatic beam, divergent from S, will come to focus at R. In examining the spectrum of light from a source S it is necessary to turn the prism so as to ensure sharpness by producing this minimum deviation for each part of the spectrum in succession. When the deviation is a minimum everything is symmetrical; SPn = RQm; QPn' = PQn': whence, by equations above, SPn = $\frac{1}{2}$(A + $mn'n$), and QPn' = $\frac{1}{2}$A; whence μ = {sin $\frac{1}{2}$(A + $mn'n$) ÷ sin $\frac{1}{2}$A}, which determines μ, when A (the angle of the prism) and $mn'n$ (the deviation) have been measured. The refractive indices of liquids and of gases are determined by enclosing them in hollow prisms of glass whose walls are made of truly parallel glass; the parallel glass produces no deviation. In liquids the angle of total reflection or 'critical angle' may also be readily measured; then the sine of this angle = 1/μ. The refractive index varies with changes of density, μ − 1 being approximately proportional to the density: and it bears certain intimate relations with the molecular constitution of the refracting matter.

Why ether-disturbances of differing wave-lengths are differently refracted in such a medium as glass is not yet perfectly clear. The fact that ether-disturbances of greater frequencies are propagated more slowly through optically denser matter may be fairly inferred to arise from a mutual interaction of the ether, periodically stressed and released, and the matter amid whose molecules the disturbance is propagated. The question is complicated by the downright absorption or non-transmission of many particular wave-lengths, and by the peculiar behaviour of some particular transparent substances which produce *anomalous dispersion:* for example, iodine vapour refracts red light more than blue, and blue more than violet; and fuchsine refracts blue and violet light less than it does red, orange, and

yellow, while it absorbs the rest. Further, it is found that in these cases of anomalous dispersion the substance generally has in the solid form a surface-colour different from that seen through its solution; and there are always absorption-bands, on the red side of which the refrangibility is increased, while on the other side it is diminished, as if the molecules themselves took up oscillations of particular periods and hurried on the propagation of slightly slower or retarded that of slightly more rapid oscillations of the ether. It appears as if this kind of action were never wholly absent; the spectrum produced by a prism never wholly coincides with the diffraction spectrum in which the deviation for each wave-length depends directly upon the wave-length itself; and the spectrum produced by a prism say of crown-glass does not exactly coincide in its visible distribution of colours with a spectrum of equal length made by a flint-glass prism. This is called the Irrationality of Dispersion. If now we take two prisms, such as C (crown-glass) and F (flint-glass) in fig. 5, and pass a beam of light through; then, if the angles of these prisms be suitable, the rays dispersed by the one will be collected by the other, and there will on the whole be deviation without dispersion; but not absolutely so, on account of the irrationality of dispersion of both prisms, the effect of which is that a calculated ratio of angles and refractive indices which will cause deviation without dispersion for any given pair of wave-lengths will, to a very slight extent in most cases, fail to do so for the other wave-lengths present in the mixed light transmitted through the system. By the use of three prisms three wave-lengths may similarly be achromatised.

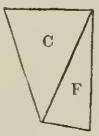

Fig. 5.

Double Refraction.—The wave-surface developed when a disturbance originates at a point in a homogeneous medium, such as glass, is spherical in form. In uniaxial crystals (see Crystals) the disturbance travels with two wave-fronts, one spherical, the other ellipsoidal; and the two wave-fronts are coincident along the direction of the optic axis. Of such crystals some are *positive*, such as quartz and ice, and in these the sphere encloses the ellipsoid: in *negative* crystals, such as Iceland spar and tourmaline, the ellipsoid encloses the sphere. If then a beam of light, plane-fronted,

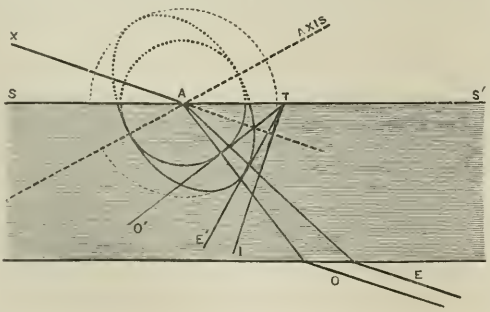

Fig. 6.

fall upon a slice of Iceland spar, the disturbance at any point such as A (fig. 6) is transmitted from that point in two portions; one portion is refracted, according to the principles of fig. 2 in article Refraction, as an *ordinary* refracted ray, O; the other is refracted in a way determinable by using in the construction, instead of the spheroid or arcs of a circle, the corresponding ellipsoid, or arcs of the appropriate ellipse, and it gives rise to the *extraordinary* refracted ray, E. The radius of the smaller circle is to that of the greater as $1 : \mu$; the tangent to the greater circle, at right angles to XA, cuts SS′ in T; tangents TO′ and TE′ to the smaller circle and the ellipse are also drawn so as to pass through T; the ray XA is deflected so as to pass through the points at which these tangents touch these curves; and thus there are two refracted rays, and an eye towards OE will see two images of X. The light in the ordinary ray O is found to be polarised (see Polarisation) in a plane containing both the incident ray and the crystalline axis: the extraordinary ray E is polarised in a plane at right angles to this. In binaxial crystals the three optical axes are dissimilar, and the wave-surfaces become complex: there are two refracted rays. If a doubly refracting substance be put between two crossed Nicol's prisms (see Polarisation), light passes; and by this means it is found that many substances ordinarily not double refracting become so when exposed to unequal stress, as by pressure, heat, or rapid cooling.

Conical Refraction.—In certain cases light, passing as a single ray through a plate of a biaxial crystallised body, emerges as a hollow *cone* of rays; and in others a single ray, falling on the plate, becomes a cone inside the crystal, and emerges as a hollow cylinder. These extraordinary appearances were *predicted* from the wave theory of light by Sir W. R. Hamilton (q.v.), and experimentally realised by Lloyd. See Preston's *Theory of Light* (1890).

Refrigerants 'are remedies which allay thirst and give a feeling of coolness,' although they do not in reality diminish the temperature of the body. The following are the refrigerants in most common use for internal administration: water, barley-water, dilute phosphoric or acetic acid, citric and tartaric acids taken in combination with bicarbonate of potash as effervescing draughts, ripe grapes, oranges, lemons (in the form of Lemonade, q.v.), tamarinds, chlorate of potash (ten grains dissolved in water, and sweetened with syrup, to be taken every third or fourth hour), and nitrate of potash, which may be taken in the same manner as the chlorate, or as *nitre-whey*, which is prepared by boiling two drachms of nitre in a pint of new milk; the strained milk may be given in frequent doses of two or three ounces.

Refrigeration. In refrigerating machines there is a transference of heat from the substance which is to be refrigerated to the cooling agent, which is evaporating fluid, expanding gas, or a material which promotes evaporation of the liquid to be cooled. If 80·025 pound-Centigrade units of heat be withdrawn from a pound of water at 0° C. it will become a pound of ice at the same temperature. If this heat be withdrawn from the water by an evaporating liquid there are two conditions which must be fulfilled; the evaporating liquid must evaporate very rapidly, and the latent heat of evaporation (i.e. the heat absorbed from outside during evaporation) must be as great as possible. Ether boils at 35·5° C. (95·9° F.), and has at 0° C. (32° F.) a vapour-pressure of 18·4 cm. (7·36 inches) of mercury; at 0° C. it requires 94 lb.-Centigrade units of heat to evaporate a pound of it; and at that temperature its evaporation ought accordingly to be able, if the whole of the heat required for evaporation were withdrawn from water, to freeze $94 \div 80{\cdot}025$ times its weight of water at 0° C., so that a ton of ice (2240 lb.) would be produced by the evaporation at 0° C. of a minimum of 1907 lb. of ether. Alcohol is more advantageous than ether in respect of its higher specific heat, but is preponderatingly less so in respect of its lesser volatility. Liquid ammonia boils at −35° C. (−31° F.), and has at 0° C. a vapour-pressure of 318 cm.

(127·2 inches), or more than four atmospheres: it is thus extremely rapidly volatilised at 0° C.; and, as its latent heat of evaporation is as much as 294, the production of a ton of ice would thus only demand the evaporation of a minimum of 610 lb. of liquid ammonia. Liquid sulphurous acid (boiling-point, −10·8° C. or 12·6° F.; vap. pr. at 0° C., 116·5 cm. or 46·6 inches, or about 1½ atm.; lat. h. of evap. 94·56) is also a volatile liquid presenting considerable advantages. Machines for using ether have been constructed by Siebe, Siddeley and Mackay, Duvallon and Lloyd, Mühl, and others. The ether is caused to evaporate rapidly by an air-pump or pumps worked by steam; it cools brine or a solution of calcium chloride, and this cools the water to be frozen or the air to be refrigerated; the ether vapour is condensed by pressure and cold and used over again. Ammonia was first used by Carré in 1860; ammonia gas driven off by heat from its solution in water is condensed in a cooled vessel under its own pressure; the original ammonia vessel is now cooled, and the liquid ammonia rapidly evaporates (its vapour being absorbed), chilling its surroundings. Anhydrous liquid ammonia has been used by Reece and others. M. Raoul Pictet of Geneva has used sulphurous acid, the evaporation of which is hastened by an air-pump. The greatest difficulties in machines of this nature are (apart from chemical action of the liquid employed) the difficulty of making joints to withstand great pressures, and the cost of condensing the evaporated refrigerant. Messrs Tessié du Motay and A. I. Rossi have introduced a solution of 300 times its volume of sulphurous acid gas in ordinary ether; the sulphurous acid and the ether are readily evaporated off together by the air-pump, and on condensation the ether settles down first, absorbing the sulphurous acid; so that there are no pressures to deal with, and no sulphuric acid produced which may corrode the metal, but only ethyl-sulphuric acid, which does no great harm.

The air-pump or sulphuric acid has also been employed to promote the evaporation of the liquid itself which is to be refrigerated. In Mr A. C. Kirk's apparatus (British patent 1218 of 1862), and in the Bell Coleman apparatus, greatly employed for producing cold dry air for use in the refrigerating chambers of dead-meat-carrying steamers, the principle is that compressed and cooled air will, when allowed to expand against an external resistance, so that it does mechanical work during expansion, lose heat equivalent to the energy which it has expended. In the former the same air is alternately compressed in one place and expanded against some resistance in another.

Porous jars, used to keep water cool, are amongst the simplest kinds of refrigerating apparatus; the evaporation at the outer surface of the jar of the water passing through the porous earthenware taking latent heat from the water (see EVAPORATION).

For details as to refrigerating machines, consult Bondie's *Ice-making Machinery* (Spon, New York); Spon's *Dictionary of Engineering* ('Ice-making Machines,' p. 1996); Spon's *Encyclopædia of the Industrial Arts* ('Artificial Ice,' p. 1133). See also the articles COLD, FREEZING MIXTURES, ICE; and for the Refrigeration of the Earth, see EARTH, TEMPERATURE.

Refugee, a name given to persons who have fled from religious or political persecution in their own country, and taken refuge in another, especially to Flemish refugees during the persecution by Alva in the Low Countries, and to French Protestants who fled to England in or after 1685, when Louis XIV. of France revoked the Edict of Nantes. See HUGUENOTS, EXTRADITION, POLITICAL OFFENCES.

Regalbuto, a town of Sicily, 25 miles WNW. of Catania. Pop. 9610.

Regalia, the ensigns of royalty, including more particularly the apparatus of a coronation. The crowns are described at Vol. III. p. 589. The regalia, strictly so called, of England consist of the crown, the sceptre with the cross, the verge or rod with the dove, the so-called staff of Edward the Confessor (made in reality for Charles II.), the orbs of king and queen, the blunt sword of mercy called Curtana, the two sharp swords of justice, spiritual and temporal, the ampulla or receptacle for the coronation oil, the anointing spoon (probably the only existing relic of the old regalia), the armillæ or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the Jewel-room in the Tower of London. Their total value is estimated at £3,000,000. See BLOOD (THOMAS); and W. Jones's *Crowns and Coronations: History of Regalia in all Countries* (1883).

The proper regalia of Scotland consist of the crown, the sceptre, and the sword of state. For the crown, see Vol. III. p. 589. The sceptre is of the time of James V.; the sword was a present from Pope Julius II. to James IV. in 1507. During the Civil War the regalia were removed by the Earl Marischal for safe custody from the Crown-room of Edinburgh Castle, their usual place of deposit, to his castle of Dunnottar (q.v.); and from the Restoration to the Union the regalia continued to be kept in the Crown-room as formerly. From the Union till 1818 the regalia remained locked in a chest in the Crown-room away from public gaze; but in 1818, an order being obtained from the Prince-regent, the chest in the Crown-room was broken open, and the crown, sword, and sceptre were found as they had been deposited at the Union, along with a silver rod of office, supposed to be that of the Lord High Treasurer. They are now in the charge of the officers of state for Scotland, and are exhibited in the Crown-room. See Sir Walter Scott's *Account of the Regalia of Scotland* (1819).

Regatta. See YACHT, ROWING.

Regelation. See ICE.

Regeneration is a theological expression denoting the spiritual change which passes on all men in becoming Christians. There are various interpretations of the mode and meaning of this change, but its necessity in some shape or another may be said to be admitted by all branches of the Christian church. By all man is supposed, as the condition of his becoming truly Christian, to pass from a state of nature to a state of regeneration, from a state in which he obeys the mere impulses of the natural life to a state in which a new and higher—a divine—life has been awakened in him. The words of our Lord to Nicodemus: 'Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God,' are accepted as the expression of this universal necessity by the Christian church. It may be further stated that every branch of the Christian church recognises, although under very different conditions, the Holy Spirit as the author of this change. The change in its real character is spiritual, and spiritually induced. According to a large portion of the Christian church, however, the change is normally involved in the rite of baptism. In the Catholic view baptism constitutes always a real point of transition from the natural to the spiritual life. The grace of baptism is the grace of regeneration; and among the direct effects of baptism are (1) the remission of all sin, original and actual; (2) the remission of the penalties due for sin both temporal and eternal; (3) the bestowal of sanctifying grace

and the infused virtues; (4) the imprinting of an indelible 'character' on the soul; besides (5) making the recipient a member of Christ and the church, and qualifying to receive the other sacraments. The usual Protestant doctrine of baptism is explained at BAPTISM; and see also GORHAM. Protestants hold for the most part that regeneration is a special, conscious process which takes place independently of baptism or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life. Technically, Conversion (q.v.) is the action upon man, Regeneration the agency of God.

Regenerator Furnace. See GLASS.

Regensburg. See RATISBON.

Regent, one who exercises the power without having the name of a king. In a hereditary monarchy there are various circumstances which may necessitate the delegation of the sovereign power—as the devolution of the crown on a minor too young to be entrusted with the kingly office; the incapacity of the sovereign by illness, mental or bodily; and the case of absence from the realm. A regent under the title of Protector (q.v.) has often been appointed to exercise royal authority in the sovereign's minority, the latest instance in England being during the minority of Edward VI.; and regents and councils of regency have been sometimes named by the sovereign to provide for the probable nonage of his heir. During the frequent absences of the first two kings of the House of Hanover in their continental dominions it was the practice to appoint regents or Lords Justices (see Vol. VI. p. 379) to exercise the powers of sovereign. In 1788, when George III. became incapacitated from exercising the kingly office by insanity, it became a question whether his eldest son, then of full age, had a right to be regent, or whether the nomination rested with parliament. The chief political authorities of the time were divided in their judgment, but the king's recovery ended the discussion. On the return of the malady all parties were unanimous that the regency should be conferred on the Prince of Wales, and this was done by parliament. In 1830 a Regency Bill was passed, providing for the administration of the government, should the crown descend to the Princess Victoria before she attained eighteen years of age; and in 1840, one providing that the Prince Consort should be regent in the event of the demise of the Queen, her next lineal successor being under age. For Regent in universities, see UNIVERSITY.

Reggio (anc. *Rhegium Julii*), a seaport of South Italy, stands on the Strait of Messina, 9 miles SE. of the city of Messina in Sicily. It is the seat of an archbishop, and has a fine cathedral. Manufactures of silks, scented waters, gloves, stockings, and caps—the last three made from the byssus of the Pinna (q.v.)—the cultivation of fruits, wine, and olives, and fishing are carried on. Pop. 23,853. The ancient *Rhegium* was founded by Greeks in the 8th century. It was taken and destroyed by Dionysius of Syracuse (387 B.C.), the Romans (270), Alaric (410 A.D.), Totila (549), the Saracens (918), and captured by Robert Guiscard (1060), Pedro of Aragon (1282), and the Garibaldians (1860). In 1783 it was ruined by an earthquake.—The *province* has an area of 1221 sq. m. and a pop. of 397,208.

Reggio, a city of Central Italy, stands on the ancient *Via Emilia*, 17 miles by rail SE. of Parma, and is still surrounded with walls. It has a good cathedral of the 15th century, one of the finest theatres in Italy, a model lunatic asylum, a natural history and an antiquarian museum, a library, &c. Pop. 18,634, who manufacture silk, hemp, turnery, leather, &c., and carry on considerable trade, especially in timber. Reggio is the birthplace of Ariosto. During the later middle ages it was an independent city, but was subject to the D'Estes from 1409 onwards. The bishopric was founded in 450.

Regiam Majestatem, a collection of ancient laws bearing to have been compiled by order of David I., king of Scotland. The authenticity of the work has been controverted, the prevalent opinion being that it is a compilation from Glanville's *Tractatus*. Some authorities attribute the collecting of it to a commission of Edward I., others to an unknown author after the war of independence (14th century).

Regicides, the men who were appointed on the parliamentary committee to try King Charles I., but in a narrower sense the men, sixty-seven in number, who actually sat in trial upon him. Of these only fifty-nine signed the death-warrant. After the Restoration the regicides were brought to trial on a charge of high-treason. Twenty-nine were condemned to death, but only ten were executed, nineteen, together with six others who were not tried, being imprisoned, most of them for life. More than twenty who were already dead were tried and condemned all the same, and Cromwell, Ireton, and Bradshaw, three of them, were exhumed and hanged at Tyburn, and then reburied at the foot of the scaffold. For regicides in a wider use of the term, see ASSASSINATION, and E. Régis' *Les Régicides dans l'Histoire et dans le Présent* (1890).

Regillus, LAKE, lay in Latium, to the south-east of Rome, probably near the modern Frascati; it is celebrated in the semi-legendary history of Rome as the scene (496 B.C.) of a great battle between the Romans and the Latins, fighting on behalf of the banished Tarquin, in which the latter were entirely defeated.

Regiment, in most modern armies, is a tactical unit consisting either of four squadrons of cavalry, some six or seven Batteries (q.v.) of artillery, or three or four Battalions (q.v.) of infantry—the engineers and other troops being similarly grouped. In the British army the cavalry regiment consists of eight troops (four squadrons) having a war establishment of 666 of all ranks (32 being officers) and 614 horses. It is a tactical unit commanded by a lieutenant-colonel, with adjutant, quartermaster, paymaster, medical officer, veterinary surgeon, transport officer, band, and artificers.

As regards the infantry the regiment is not a tactical unit. The name is often still given to single battalions owing to the fact that previous to 1881 it was used indiscriminately for infantry corps whether they consisted of two battalions, as did the first twenty in the *Army List*, or of four, as did the 60th. But in that year 133 battalions of the line were reorganised to form 67 regiments, which should each consist of two battalions of line infantry, two or more battalions of militia, and whatever volunteer battalions there might be in the territory allotted to each regiment for recruiting purposes and called its Regimental District (q.v.). The Cameron Highlanders (old 79th) were left an exception with only one battalion. It was proposed to link them to the Scots Guards, but the Camerons objected, and the difficulty was got over in 1897 by raising a new second battalion. The Guards retain their old organisation—three battalions of Grenadiers, three of Coldstreams, and three of Scots Guards (one of Irish Guards was

embodied in 1900)—and the 60th Rifles and Rifle Brigade, each of four battalions, are allotted to the regimental district at Winchester. The two West Indian regiments (single battalions) have since been formed into a regiment of two battalions. Like the regiments of the native armies of India, no militia or volunteer battalions are attached to it. A territorial regiment is therefore a purely administrative unit, and has no war establishment. It is commanded by a colonel, assisted by an adjutant and quartermaster, and its depôt companies, two for each line battalion, train recruits for the service companies.

The Royal Regiment of Artillery is also a purely administrative organisation, including all the horse, field, and mountain batteries and garrison companies of the regular army. The corps of Royal Engineers similarly comprises all the officers and men of that arm. Militia and volunteers are attached to each, and they are each represented at the War Office by a deputy-adjutant-general.

The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland, 1598. From that time forward the army and militia of Britain have been organised into regiments. Charles I. and the parliament each raised regiments, all of which were disbanded at the Restoration, with the exception of the Lord-general's Regiment of Foot and his Life Guard of Horse. These two were re-engaged (1661) and form the present Coldstream Guards and Royal Horse Guards. In the same year a Scotch corps of 1700 men, which had taken service in France in the time of James I., returned to England, and was included in the British army as the 1st Foot. See ARMY, Vol. I. p. 433. In 1693 was raised the 1st troop of Horse Grenadier Guards, and the 2d troop in 1702. These were re-formed in 1782 as the 1st and 2d Life Guards.

Regimental officers are those who are actually doing duty with a regiment, battalion, battery, or company as combatants, in contradistinction to those who may be on the staff or otherwise employed.

Regimental badges, mottoes, and *devices* are detailed in the Queen's Regulations, and emblazoned, with the battles and campaigns in which either of the battalions of the regiment has been engaged, on its colours or appointments.

Regimental pets are animals which accompany the troops on all occasions and have a recognised place on parade. Many infantry battalions have them—e.g. the Royal Welsh Fusiliers always have a white goat, which since the year 1844 has been regularly presented to them by the Queen.

For *Regimental Schools*, see ARMY, Vol. I. p. 439.

Regimental district (formerly brigade depôt) is the territory allotted to each infantry regiment of the British army. The localisation of the forces followed naturally on the adoption of a short service system. The increased number of recruits annually required necessitated the spreading of recruiting agencies over the country, and the desirability of obtaining men from a district to which they would afterwards return as reservists was obvious. The original scheme of 1873 has been modified in many ways, and may be briefly summarised as follows: For the purposes of command, the United Kingdom is divided into 14 districts—ten for England, one for Scotland, and three for Ireland (the Channel Islands command does not share in the localisation scheme), under general officers. Each of these districts has a floating body of regular troops, and is subdivided (with the exception of the Thames, Woolwich, and Aldershot districts) into a certain number of *regimental districts*—69 altogether.

To each of these regimental districts are assigned, normally: (*a*) Two line battalions—if possible one at home and one abroad (see, however, REGIMENT); (*b*) regimental depôts composed of two companies, under a major, two captains, and two subalterns, from each line battalion belonging to the district; (*c*) the militia and volunteer battalions of the district, as well as the infantry of the army reserve. The linked battalions of the line together with the militia battalions form a *territorial regiment*—to which the volunteer battalions are attached. If possible a territorial regiment draws its recruits from its own district, and the promotion of officers of the line takes place in the regiment and not in a particular battalion. Militia recruits are trained at the depôt, and every effort made to draw close the connection between the line and the militia. Each regimental district is in charge of a lieutenant-colonel, who superintends the recruiting of the district, and commands the auxiliary and reserve forces in it. His staff comprises an adjutant, quartermaster, paymaster, medical officer, and the usual non-commissioned officers.

Regina, capital of the Canadian province of Assiniboia and seat of government of the North-west Territories, 357 miles by rail W. of Winnipeg. The chief buildings are the lieutenant-governor's residence and the headquarters of the mounted police. Pop. 2000.

Regiomontanus, a German mathematician and astronomer whose name was Johann Müller, was born at Königsberg in Franconia, 6th June 1436. From his birthplace he called himself in the mediæval fashion Johannes de Monteregio; since 1544 Regiomontanus is the name by which he has been known. He was trained by the Austrian mathematician George Purbach (1423–61), studying under him at Vienna and elsewhere. In 1461 he accompanied Cardinal Bessarion to Italy in order to learn Greek. He sojourned in Rome, Ferrara, Padua, and Venice; returned for a time to Vienna, and was called by Matthias Corvinus to his court at Buda; but in 1471 he settled in Nuremberg, where a learned and wealthy citizen, Bernhard Walther, subsidised him so as to enable him to construct mathematical and astronomical instruments and found a famous printing-press. The two laboured together at the correction of the 'Alphonsine Tables,' and jointly published *Ephemerides 1475–1506* (1473), of which Columbus and other early navigators made much use. Regiomontanus not only worked at astronomy, but restored the study of algebra in Germany, extended the science of trigonometry, and published treatises on water-works, burning-mirrors, weights and measures, &c. He was summoned to Rome by Pope Sixtus IV. to assist in reforming the calendar, was made Bishop of Ratisbon, but died at Rome, 6th July 1476.

Among his works are *De Doctrina Triangulorum* (1463); *De Quadratura Circuli* (1463); *Calendarium* (1473); *De Reformatione Calendarium* (1484); *De Cometæ Magnitudine* (1531); *De Triangulis Omnimodis* (1533). See Ziegler, *Regiomontanus, ein geistiger Vorläufer des Kolumbus* (1874).

Register of Voice. See VOICE.

Registers, PARISH. The place which parish registers now fill was formerly, but only in very small part, supplied by monastic registers, which, however, as a rule registered only deaths of important persons, so as to be able to tell when masses became due, and were usually confined to the families of founders, benefactors, and the like. Entries were also sometimes made in the missals of parish churches, and the monastic chronicles often contain necrologies, whilst mortuary rolls were regularly sent round from monastery to monastery.

These were in effect the sole early public registers, but private necrologies were sometimes kept by the chaplains of great families—e.g. Friar Brackley has left one of the Pastons and Mawtbys—and Burn (*History of Parish Registers*) mentions several entered in the flyleaves of private books of devotion. But it is mainly to the monastic cartularies and to inquisitions *post-mortem* and proofs of age that we must go for information on births and deaths of the pre-Reformation times.

It is probable that the injunction of Thomas Cromwell in 1538, ordering parish registers to be kept under the system now in vogue, was intended, like Edward VI.'s scholastic foundations, to meet one of the immediate difficulties involved in the suppression of the monasteries. Had this injunction been strictly acted on we should now be in possession of complete registers from that date onwards. But, perhaps owing to the fall, soon after, of the author of the injunction or to the general laxity of the incumbents, very little heed was taken of it, and the evil which this neglect entailed became so crying that Elizabeth in 1597 issued a stringent order that not only should the registers be better kept, but copies of them should be yearly sent to the bishop of the diocese, an order which in 1812 was supplemented by an act enjoining the preservation, arrangement, and indexing alphabetically of the names on the registers. But nothing has been of much value against the incorrigible neglect of the incumbents and bishops. Early transcripts are practically non-existent, and even those of the 18th century are most imperfect. In the returns of the population abstracts in 1801 it was discovered that amongst 11,000 parishes in England 812 registers dating from 1538 alone existed, and later returns in 1834 showed that even that small number had decreased through the negligence of the clergy in the interval. These last returns give full details as to the date of the commencement of each register in England. The only hope in the future for the preservation of the remnant lies in the instant removal from the parish churches (or, as is too often the case, the incumbent's library) of the actual registers and of the transcripts from the bishops' registers to the Public Record Office or to some kindred institution, otherwise further loss must be expected in spite of the fact that many of the clergy are at last waking up to their duty in the matter and many have transcribed and indexed their registers, while some have been printed by the Harleian Society and by private individuals.

A full list of the printed registers was issued in 1891 by Dr G. W. Marshall. Other standard works on the subject are Bigland's *Observations on Parish Registers* (1764) and Burn's *History of Parish Registers* (1829; 2d ed. 1862), while *brochures* on the same subject have been printed by Mr Chester-Waters (1870; new ed. 1887) and Mr Taswell-Langmead.

From these works the reader may see how the registers often contain much valuable information as to the history of the parish, many incumbents slightly overstepping their strict duty by putting down noticeable and curious incidents which occurred from time to time. The proper fees for searching are one shilling for the first year (which includes births, marriages, and burials, though some clergymen try to charge them separately) and sixpence every subsequent year. It seems doubtful if the searcher may take general notes, but he may copy one entry per year without being compelled to pay the further fee of 2s. 7d. which is the clergyman's due if he is asked to give a certified copy. Most custodians of registers, however, are extremely liberal, and seldom take fees when the object of the search is a literary one.

Registration may be described as an account of certain transactions and legal facts inserted in a book called a register and kept at a public office. The purpose in view usually is to preserve an authentic and exact record of the transactions, to secure for them a means of publicity, or to simplify the methods of proving them. The practice of inscribing a copy of private documents in a public register seems to have been originally introduced by the Emperor Leo in reference to gifts—the object being to enable heirs to ascertain to what claims the estate was liable before deciding whether to accept the inheritance. A system of registration is now employed in many different departments and for very various purposes. The extent to which registration is carried varies very much in different countries; on the whole, however, it is more carefully enforced and more widely applied in continental states than in England or America. In France and Italy, for example, in almost all transactions parties resort to a notary, who draws up the documents relating to the business in hand. Such notarial transactions are to a certain extent public acts, and are presumed to be valid and binding, until they have been impeached and set aside by a separate proceeding instituted for that purpose. Further, in these countries all documents executed in the presence of a notary having any reference to certain subjects—for example, to the creation or transfer of an interest in land—are transcribed by him in a public register, and so become available for general information.

In England all judicial decisions and the whole proceedings of the higher courts in their various stages are registered; and with registrars attached to the Privy-council, the supreme court, and the county courts, affidavits, pleadings, &c. are filed. Probates of wills and letters of administration, both of which are really judicial proceedings, are registered either in the principal registry of the Probate Division in London, or in one of the district registries, which are situated at various places throughout the country. Land registries, for officially recording the title to, dealings with, and charges on land, are of two classes—viz. registries of title and registries of assurances. The former are authentic and self-explanatory records, behind which one cannot go except in case of fraud. The latter merely contain a statement of the existence of documents or assurances affecting the title to the land, giving an epitome of each document, and leaving the persons concerned to draw their own conclusions as to the effect of those documents on the title to the land. The whole subject of land registration has been much discussed of recent years in England, and several attempts to establish a system of registration have been made without much success. Lord Westbury's Act (25 and 26 Vict. chap. 53), establishing a general land registry for England and Wales, has notoriously proved a failure. The present statute regulating the general registration of land is the Land Transfer Act (38 and 39 Vict. chap. 87), which creates an office of land registry in London; but in the case of this act also practical results have been very small. The doubts and complications surrounding titles to land in England are so appalling that, though a compulsory system of registration is universally recognised to be expedient, parliament has not dared to enforce it. Bills of sale must be registered within seven clear days after execution, or, if executed out of England, then within seven days after their arrival in England; further, a bill, if still existing, must be re-registered every five years. Under the Merchant Shipping Acts every British ship must be registered, as also must all changes of ownership in a ship, whether by sale, mortgage, death, or bankruptcy; in the United

Kingdom the principal officer of customs at the port of registry is the registrar. Among the other principal registers are the register of joint-stock companies, established by the Companies Acts; the register of friendly societies; the registers of designs, copyrights, patents, and trade-marks; the registers of seamen, of newspapers, of solicitors, of petitions in lunacy, and so on.

In Scotland registration is an important feature in the administration of the law. It may be treated under two heads—viz. registration for preservation and execution, and registration for publication. Registration in order to execution—i.e. to enforce the performance of obligations, arose before the Reformation from the practice of churchmen, who, in order to bring the enforcement of ordinary contracts within their jurisdiction, procured the insertion in obligations of a solemn oath of performance and consent to excommunication in the event of failure. It is now an almost universal practice to insert a clause of registration in deeds stipulating for money payments, especially in bonds. A short clause of registration has been introduced by recent conveyancing acts, in these words: 'And I consent to registration hereof for preservation (or for preservation and execution);' and this clause, in any deed or writing whatsoever, is declared to import 'a consent to registration and a procuratory of registration in the Books of Council and Session, or other judge's books competent therein to remain for preservation; and also, if for execution, that letters of horning and all necessary execution shall pass thereon, upon six days' charge, on a decree to be interponed thereto in common form' (31 and 32 Vict. chap. 101, sects. 8, 138). Such registration for execution, which is in effect a short cut to a judgment without the formality of an action, may take place after the death either of the creditor or of the debtor. By special statutes the privileges of registration in order to diligence are extended to bills and promissory-notes, the acceptance and subscription of which implies a consent to registration for execution. The records now available for registering deeds for preservation or execution are these: (1) The Register of the Great Seal; (2) the Books of Council and Session, for all deeds and probative writs; (3) the books of any sheriff court; (4) the books of royal burghs, for instruments of protest on bills or notes; (5) the General Register of Sasines.

Registration for publication applies chiefly to writs connected with heritable rights. The present system owes its origin to the statute 1617, chap. 16, which established a general register in Edinburgh, and particular or local registers throughout the country, in which sasines and other writs affecting heritable property should be registered within sixty days of their date. The instrument of sasine and the whole ceremony of sasine are now dispensed with in the transfer of lands; by the Titles to Land Acts of 1858 and 1860, the recording of the conveyance itself, with warrant of registration thereon, now constitutes infeftment to the same effect as if an instrument of sasine had been expede and recorded at the date of recording the conveyance. Registration, however, operates as infeftment only in favour of the party expressed by the warrant. The registers for publication now subsisting are (1) the General Register of Sasines, divided into counties; (2) Register of Entails; (3) General Register of Inhibitions and Adjudications; (4) the Burgh Registers of Sasines for lands in each royal burgh in which such a register has been in use to be kept. The public registers of Scotland used to be under the charge of the Lord Clerk Register; but the duties of that functionary in this connection were by 42 and 43 Vict. chap. 44, sect. 5, transferred to the Depute-clerk Register. All the records are collected at the General Register House in Edinburgh.

In the United States, in order to be wholly valid, a deed or other instruments affecting the title to real estate must be recorded in the proper office for the registry of deeds, and this constitutes constructive notice of its contents. A chattel mortgage must be filed to be effective against third persons; but it is valid between parties without filing. In most of the states the effect of the filing continues only for a limited period, usually for a year, and the mortgagee must consequently refile within the prescribed time. The certificate of the recording officer is conclusive of the fact of filing. For a digest of the provisions of the different statutes as to the registration of deeds, see Stimson's *American Statute Law*, sect. 1610 *et seq.*

Registration of Births, Deaths, and Marriages is the name for the system of regulations providing for a record of these events. In England the first act on the subject dates from 1836. By it a general registry-office was provided at Somerset House, London, for England and Wales. But even before the new arrangement there had been long in operation an ecclesiastical mode of registration of marriages, baptisms, and burials in connection with each parish church, it being the duty of the officiating minister to keep such a register (see Registers, Parish). Also, since 1592, the compilation of weekly bills of Mortality (q.v.), containing particulars as to the death-rate of London, has gone on almost uninterruptedly. These modes of registration were found to be well-nigh useless for statistical purposes. Hence the systematic plan instituted in 1836, by the Acts 6 and 7 Will. IV. chaps. 85, 86, which have been since amended by subsequent legislation, the whole being entitled the Births and Deaths Registration Acts, 1836–74; the last and most important is the 37 and 38 Vict. chap. 88. There are special legislative provisions as to the registration of marriages. The acts provided that the head of the system should be the Registrar-general of births, deaths, and marriages in England. An annual abstract of the registrar's returns must be laid before parliament. Every poor-law union throughout the country is subdivided into districts, and in each district a locally-resident registrar is chosen. Superintendent-registrars are also appointed. The registrars make out their returns quarterly, and send them to the superintendent-registrar of the district, by whom they are transmitted to the general register-office. There they are preserved, and may be inspected or excerpted on payment of a small fee.

Births.—In the case of every child born alive, the father and mother, or, in their default, other specified persons, are to give notice of such birth to the district registrar within forty-two days after the occurrence. If this is not done he may require any of the defaulters, by notice in writing, to attend and inform him, within three months of the birth, with the particulars thereof. Special provisions are made for the case of foundlings, children born at sea, &c. It is the duty of the registrar to acquaint himself with all births in his district, and register the same within three months free of charge. After three months the birth can only be registered with certain formalities, including payment of a small fee, and after twelve months only with the written consent of the Registrar-general. The particulars to be registered are the place and date, sex of child, its name and that of the mother and the father, with the calling of the latter. The signature and description of informant are also noted. The date of registration and signature of registrar complete the entry.

Marriages.—These may be religious or civil. In

the first case they may be performed according to the rites of the Church of England, of the general body of Nonconformists, of the Society of Friends, or of the Jews. The Registrar-general must send marriage register-books to the minister of every church and registered chapel, and to each registering officer in England of the Society of Friends or Quakers, and every secretary of a synagogue in England. In each case, the official to whom the book is sent must register in two of the books in duplicate the particulars of the marriage. One of these books when full is sent to the superintendent-registrar, and a quarterly return is also furnished to him. In the case of Nonconformists other than Jews and Quakers, the registrar attends at the registered building, and registers the marriage himself, as he also does when it is a purely civil ceremony taking place at his office. The particulars entered are date of marriage and name, age, condition, calling, residence, father's name and calling of both parties.

Deaths.—Much of what has been said about registration of births applies to registration of deaths, but the following points are to be noted. Notice must be given within five days of the occurrence by the nearest relative of the deceased present; if he does not, the duty falls on other specified persons. A notice preliminary to registration may be sent, and this extends the time to fourteen days. In default of action of others, the registrar ought to require the person liable to appear before him before twelve months from the death have elapsed, and supply him with the statutory particulars. After the lapse of twelve months there must be written authority of the Registrar-general before the entry can be made. There are special provisions for inquest cases, &c. The particulars of registration are date, place, name, sex, age, calling, cause of death, name of certifying medical man, name and description of informant, date of registration, and signature of registrar. Provision is made for sending notice of the death of medical practitioners, &c. to special registrars, in order that their names may be struck off special lists.

All the registers since 1836 and a number of the older irregular ones are preserved in Somerset House. The registrars are bound to permit, on payment of a fee, a search of such recent registers as are in their possession. There are thirty-nine acts on the subject. They are from the 52 Geo. III. chap. 146 to the 50 and 51 Vict. chap. 71. In Ireland the system of registration, introduced in 1863, is almost exactly the same as in England. There is a Registrar-general and a general register-office at Dublin. In the case of Roman Catholic marriages, a registrar's certificate must be obtained and produced before celebration. The officiating clergyman then fills it up; it is returned to the registrar, who enters the particulars in the proper books. Other religious marriages are registered in the same manner as Church of England marriages are in England. There are fifteen acts dealing with the subject, the first being the 7 and 8 Vict. chap. 81, the last the 43 and 44 Vict. chap. 13.

Although the law in Scotland on this subject is much the same as in the rest of the United Kingdom, some points of difference are to be noted. The general register-office is at the Register House, Edinburgh. The office of Registrar-general is held by the Deputy-clerk Register. Notice of a birth is given in twenty-one days; after three months a declaration must be made before the sheriff by the informant of the particulars proposed to be registered. Provision is made for correction of the register in the case of children legitimated *per subsequens matrimonium*. Notice of death is to be given within eight days of the event. In the case of regular religious marriages a statutory schedule is produced to and filled up by the officiating minister. It is then sent to the registrar, who enters the necessary particulars in his book. The registrar is bound, when required, to be present at a marriage, and register the same. The statutory fee for this is 20s., and he is entitled to the same sum for registration after conviction or decree of declarator of an irregular marriage. There are ten acts dealing with the subject, the first being the 10 Anne, chap. 10, the last the 48 and 49 Vict. chap. 61, sect. 5. It will be understood that penalties of varying degrees of severity are enacted against breakers of the Registration Acts. See Flaxman's *Registration of Births and Deaths in England, Wales, and at Sea* (1875).

Registration of Voters.—It is a condition precedent to the exercise of the right to vote in parliamentary elections that the name of the voter should be upon the register—a preliminary requisite first introduced when the franchise was remodelled in 1832. In England the process of registration, as settled by the last Registration Act (48 and 49 Vict. chap. 15), is as follows: On the 15th of April in each year a precept, containing a description of the qualifications which entitle persons to be registered as voters, is sent by the clerk of the peace in a county, or by the town-clerk in a borough, to the overseers of every parish or township. Before the 31st of July the overseer must make out a list of occupiers, whom he has ascertained to be qualified—persons who have paid their rates, and who are not disqualified by receipt of parochial relief—and a list of lodgers, who have sent in their claims to vote in respect of their lodgings. By the 20th of August all new claims have to be sent in, and the lists, together with notices of objections, have to be published on the door of every church or public chapel in the parish. These lists of occupiers and of claims and objections are then sent by the overseer to the clerk of the peace in a county, and to the town-clerk in a borough. In September the revising barrister comes round and adjudicates upon disputed claims and objections; from his decision an appeal lies on a case stated by him to the Queen's Bench Division of the High Court. After this revision the register is finally made out. If it is for a county, there are three lists—lists of ownership, occupation, and lodger voters; if it is for a borough, there are two lists—the ownership list being omitted in boroughs.

In Scotland the system of registration is carried on largely by means of the machinery introduced, for the valuation of land, by the Valuation Act (17 and 18 Vict. chap. 91). The valuation roll, annually made up under the Valuation Act, is the basis of the register of voters; a new form of this valuation roll was provided in the Registration Act of 1885, each dwelling-house in the county or burgh being now specified in the roll. The duties of assessor for registration purposes are performed by the valuation assessor of each burgh, or county, or division of a county; he may not be a sheriff-clerk, or collector of poor-rates, or employed as a factor or land agent in the county or burgh for which he is assessor. Every year, on or before the 15th of September, the assessor makes out a list of voters, arranged alphabetically according to wards or parishes and polling districts, and publishes the list by affixing it to the town-hall, the parish church, or other conspicuous place. Any person whose name is on the list may object to any other person as not having been entitled, on the last day of July preceding, to have his name inserted, by giving notice in a form prescribed, on or before 21st September, to the assessor and to the person objected to; similarly, any person whose name has been omitted may claim to have it inserted,

by notice to the assessor. Between 25th September and 16th October sheriffs hold open registration courts for the purpose of revising the lists of voters and disposing of claims and objections. The revised list is delivered by the sheriff to the town-clerk or the sheriff-clerk, and, being printed, constitutes the register of persons entitled to vote at any election before the 1st of November in the succeeding year. Appeals in registration cases are carried to a special court, constituted by the Reform Act of 1868, consisting of three judges of the Court of Session, one judge from each division of the Inner House, and one from the Lords Ordinary.

See works by G. L. Broune (1878), Cox and Grady (new ed. 1880), F. E. Davis (new ed. 1880), F. N. Rogers (14th ed. 1885), J. H. Saint (1885–87), and M. Mackenzie (1888).

Regium Donum (Lat., 'royal gift'), an annual grant of public money formerly received by the Presbyterian and other Nonconformist ministers in England, Scotland, and Ireland. It began in 1672, when Charles II. gave £600 of secret-service money to be distributed annually among the Presbyterian clergy in Ireland, on hearing that they had been loyal to him, and had even suffered on his account. The grant was discontinued in the latter part of the reign of that monarch, as well as in the time of James II., but was renewed in Ireland by William III. in 1690, who increased it to £1200 a year. It was further augmented in 1723 by George I., in consequence of the Presbyterians having supported the House of Brunswick, and raised by £2200 in 1784, and again by £5000 in 1792. The amount of the Irish grant for 1868 was £45,000. The propriety of receiving the Regium Donum was of late years much disputed by those of the same persuasion in England and Scotland. The Irish Regium Donum was withdrawn by the Act of 1869, which came into force in 1871, disendowing the Irish Episcopal Church. Compensation was made of life interests; and the ministers were allowed to commute on the same terms as the clergy of the Church. In 1874 it was reported that the commutation money paid had amounted to £579,762. The Regium Donum in England was enjoyed by the three denominations, Presbyterians, Independents, and Baptists, from 1723 till 1851. The amount required, £1695 per annum, was annually voted by parliament till July 17, 1857. The Scotch Episcopalians also enjoyed for a time a small part.

See Reid's *History of the Irish Presbyterian Church*; and for the English Regium Donum, Stoughton's *History of Religion in England*, Skeat's *Free Churches*, and Dr Edmund Calamy's *Account of his own Life*.

Regnard, Jean François, French comic dramatist, was born at Paris in 1655. A rich shopkeeper's son, he found himself at twenty master of a considerable fortune, and at once set out on his travels. In Italy he gave himself up to gambling, but, strange to say, increased rather than diminished his means. In his autobiographical romance, *La Provençale*, we read, but somewhat dubiously, of the passion of himself as Zelmis for a young Provençal wife (Elvire), his voyaging back to France with her and her husband, their capture and sale as slaves by Algerian pirates, how he made himself pleasing to his master by skill in cookery, was carried by him to Constantinople, and, at the end of his two years' captivity and many strange adventures, was ransomed, together with the lady, for 12,000 crowns. Her he was next about to marry when the husband reappeared, and sent the lover off again on aimless wanderings through Holland, Denmark, and Sweden, to Lapland, and back by Poland, Turkey, Hungary, and Germany. From his return to Paris (1683) he gave himself to letters, and found his true vocation in the success of *Le Divorce* at the Théâtre Italien in 1688. Eight years later his fine comedy, *Le Joueur*, achieved success at the Théâtre Français. Its successors were *Le Distrait* (1697), *Le Retour Imprévu* (1700), *Les Folies Amoureuses* (1704), *Les Ménechmes* (1705), and his masterpiece, *Le Légataire Universel* (1708). He died before his time, and so suddenly as to originate various contradictory reports, 4th September 1709. Regnard was an indifferent poet, but he was a master of dramatic situation and of comic dialogue, if not of verisimilitude or reality. To this day the reader endorses Boileau's judgment, expressed once when some one charged Regnard with mediocrity—'Il n'est pas médiocrement gai.' 'Qui ne se plaît point à Regnard,' said Voltaire, 'n'est pas digne d'admirer Molière.'

There are editions by Didot (1820), Michiels (1854), and Fournier (1875). See the study by Mahrenholtz (Oppeln, 1887), and *Bibliographie* by Marchéville (1877).

Regnault, Alexandre Georges Henri, painter, was born in Paris, 30th October 1843, the son of Henri Victor Regnault (q.v.). His aptitude for drawing manifested itself very early, and he was continually sketching the animals in the Jardin des Plantes. After an excellent career in the Lycée Napoléon, he left school in 1859, and studied art under Lamothe and Cabanel; and, after two unsuccessful attempts, gained the *prix de Rome* in 1866. Reaching Rome early in the following year, he executed there a remarkable portrait of Madame Duparc, and his historical subject of 'Automedon breaking the Horses of Achilles,' and drew on wood illustrations for Way's *Rome*. He next passed to Spain with his friend Clarin; and here, as afterwards in Tangier, he found subjects of that wildly picturesque character which best suited his genius. In 1869 he painted his powerful equestrian portrait of General Prim, now in the Louvre, and his 'Judith,' and in 1870 contributed his 'Salome' to the Salon. In 1870 was also painted, at Tangier, his terrible picture, 'The Execution without Judgment under the Moorish Kings of Granada'—a work now in the Louvre. In the same year he returned to Paris on the outbreak of the Franco-Prussian war; and though, as a *prix de Rome*, he was exempt from military service, he volunteered as a private soldier, and on the 19th January 1871 was slain on the field of Buzenval, in his twenty-eighth year. As an artist he had by no means fully expressed himself; but he had produced much that was marked by great energy and power, that caught in a peculiarly vivid way the splendid and barbaric life of the East—a life, in the words of the painter himself, 'at once rich and great, terrible and voluptuous.' A monument to Regnault, sculptured by Henri Chapu, has been erected in the Ecole des Beaux Arts, Paris.

See the Lives, in French, by Cazalis (1872) and Marx (1887), and his *Correspondance*, ed. by Duparc (1873).

Regnault, Henri Victor, chemist and physicist, was born at Aix-la-Chapelle, 21st July 1810. A shopman in a Paris bazaar, he made such good use of his scanty leisure as to qualify himself for admission (in 1830) to the École Polytechnique, and, after the two years' course, came out as a mining engineer. He became a professor in Lyons, whence, in 1840, he was recalled to Paris as a member of the Academy of Sciences, in consequence of some important discoveries in organic chemistry. Having filled chairs in the École Polytechnique and the Collège de France, he became in 1854 director of the imperial porcelain-manufactory of Sèvres. He devoted himself to the determination of important physical data, such as the laws of expansion of gases, the measure-

ment of temperature, latent and specific heats, and especially the numerical data bearing on the working of steam-engines, for which the Royal Society of London awarded him their Rumford medal. He also received the Copley medal (1869) of the Royal Society, and was one of its foreign members. In addition to numerous papers in the *Annales de Chimie*, &c., he published a *Cours Elémentaire de Chimie* (4 vols. 14th ed. 1871). He died 20th January 1878. See the *Éloge Historique* by Dumas (1881).

Regnier. Mathurin, a great French satirist, was born at Chartres, 21st December 1573. His father was a well-to-do citizen; his maternal uncle was the Abbé Desportes the poet. The boy was tonsured at nine, but grew up dissipated and idle. In early youth he seems to have visited Italy in the suite of the Cardinal de Joyeuse, and is supposed later to have transferred his services to Philippe de Bethune, who went as ambassador to Rome in 1601. He obtained a canonry at Chartres, and enjoyed the favour of Henry IV. and his court. But his follies sapped his health, and he died an untimely death, 13th October 1613. His first collection of satires had appeared in 1608. Regnier's whole work together scarce exceeds 7000 lines—sixteen satires, three epistles, five elegies, and some odes, songs, epigrams, and miscellaneous pieces—yet it is enough to place him high in the order of merit among the poets of France. He is greatest in his satires, written in the usual Alexandrine couplet, and admirably polished, yet vigorous and original. They touch social and moral questions only, and consequently are not of merely ephemeral interest, as political satires most often are; and, what is rare in French satire, they mostly escape the fault of handling abstract types instead of actual concrete embodiments of the type. Breadth, force, and reality characterise them all, but these merits together reach their highest point in the thirteenth, *Macette*, a satire on a hypocritical old woman who corrupts the hearts of the young around her by her cynical views of life. Regnier imitated indeed the satire of Juvenal and Horace, yet he did not copy it, and he threw his own heart into the form he borrowed. He was the last of the great poets of the 16th century: after him was to follow a period of barrenness, alike from the poverty of nature and the sterilising influences of the traditions of Malherbe and his school. It was against the attacks of Malherbe that Regnier championed Ronsard, and later he himself was defended by Boileau.

Editions are by Brossette (1729), Lenglet Dufresnoy (1733), Prosper Poitevin (1860), M. de Barthélemy (1862), and E. Courbet (1875). See Cherrier's *Bibliographie de Regnier* (1889).

Regrating. See Engrossing.

Regular Canons. See Canon.

Regulars. See Clergy.

Regulus, a term in Metallurgy, which is now used in a generic sense for metals in different stages of purity, but which still retain, to a greater or less extent, the impurities they contained in the state of ore. When, for example, the ore known as the sulphide of copper is smelted, the product of the different furnaces through which it passes is called regulus until it is nearly pure copper. The name, which signifies 'little king,' was first given by the alchemists to the metal antimony, on account of its power to render gold brittle.

Regulus. See Golden-crested Wren.

Regulus, Marcus Atilius, a favourite hero with the Roman writers, was consul for the first time in 267 B.C., and for his military successes obtained the honour of a triumph. Chosen consul a second time (256), he was sent along with his colleague Manlius at the head of a navy of 330 ships against the Carthaginians, and encountering the enemy's fleet off Heraclea Minor he totally defeated it. The Romans then landed near Clypea, where for some time Regulus was victorious in every encounter, but at last (255) suffered a total defeat and was taken prisoner. He remained in captivity for five years, but when fresh reverses induced the Carthaginians to solicit peace Regulus was released on parole and sent to Rome in company with the Punic envoys. It is related by the Roman poets and historians, as an instance and a model of the most supreme heroism, how Regulus at first refused to enter Rome since he was no longer a citizen; how, after this conscientious scruple was overcome, he declined to give his opinion in the Senate till that illustrious body laid upon him its commands to do so; how he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners; and how, after he had succeeded by his earnest appeals in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Carthage, where the rulers, maddened by the failure of their schemes through his instrumentality, put him to death by the most horrible tortures. The common story is that he was placed in a cask or chest stuck full of nails, also that, with his eyelids cut off, he was exposed to the glare of the African sun. Unfortunately this noble tale of heroic patriotism and unflinching fortitude is unhistorical, or at least unsupported by any good authority.

Regulus, or Rule, St, according to legend, a monk of Constantinople or bishop of Patras who in 347 A.D. came to Muckross or Kilrimont (afterwards St Andrews), bringing relics of St Andrew to Scotland from the East. The adoption of St Andrew as the national patron saint appears to belong to the first half of the 8th century; and for the possible identification of St Regulus with an Irish St Riagail of the 6th century, see Skene's *Celtic Scotland* (vol. ii. 1877).

Regur, the rich, black cotton soil of India. It is the result of the long-continued growth and decay of vegetation—the organic residue being commingled with the disintegrated and decomposed debris of the subjacent rocks.

Rei. See Milrei.

Reichenbach, a manufacturing town of Saxony, 11 miles SW. of Zwickau, produces woollen fabrics—merinoes, flannel, shawls, quilts, cashmere—and has wool-spinning, dyeing, and calico-printing works. Pop. (1885) 18,330.

Reichenbach, a town of Prussian Silesia, 46 miles by rail SE. of Liegnitz. Pop. 7368.

Reichenbach, Heinrich Gottlieb Ludwig (1793–1879), a botanist and zoologist, from 1820 a professor at Dresden.—His son, Heinrich Gustav (1824–89), was also a botanist, a professor at Hamburg from 1862. He was famous in connection with orchids.

Reichenbach, Karl, Baron von, naturalist and technologist, was born at Stuttgart, 12th February 1788, and educated at Tübingen. After a short political imprisonment at the instigation of the French authorities, he studied the industrial arts, and in 1821, in connection with the Count of Salm, he commenced a number of manufactories of different kinds at Blansko in Moravia, which he managed with great success, retiring with a fortune. He devoted much study to the compound products of the distillation of organic substances, and he succeeded in bringing to light a number of

compounds of carbon and hydrogen not previously known; among these were creasote (1833) and paraffin. Studying with enthusiasm the subject of animal magnetism, he discovered, as he thought, a new force in nature, which he called Od (q.v.), and conceived to be intermediate between electricity, magnetism, heat, and light, and recognisable only by the nerves of sensitive persons. His chief works are *Geologische Mittheilungen aus Mähren* (1834), *Untersuchungen über die Dynamide des Magnetismus* (1847–49), several works on 'odic force' (1852–58), *Aphorismen* (1866), *Die Odische Lohe* (1867). Several of his works have been translated. He died at Leipzig, January 19, 1869. See biographical works by Schrötter (1869) and Fechner (1876).

Reichenberg, the chief seat of the cloth manufacture in North Bohemia, stands on the Neisse, 86 miles by rail NE. of Prague. Apart from the principal industry, in which, in the town and neighbourhood, some 10,000 workmen are employed, cotton and woollen fabrics, machinery, and leather are manufactured. The cloth industry was established here in the 16th century. There is an important industrial school. Pop. (1890) 30,890.

Reichenhall, an Alpine spa in the extreme south-east of Bavaria, 10 miles SW. of Salzburg. It was almost wholly consumed by fire in 1834, and has been handsomely rebuilt. It is the chief centre of the Bavarian salt-works, and in the manufacture of salt (11,800 tons annually) its 3436 inhabitants are for the most part employed, though the delightful air of the valley in which it stands, and its saline springs, attract about 6000 visitors every summer. The salt-springs are fifteen in number, and lie at a depth of 80 feet; two of them yield 25 per cent. of salt. A brine conduit, 75 miles in length, conveys the water of the salt-springs from Berchtesgaden, through Reichenhall, over mountain 1150 feet high, to Traunstein and Rosenheim, in the vicinity of which abundant timber for fuel is procurable.

Reichstadt, Duke of. See Napoleon II.

Reichstag. See Germany, Vol. V. p. 178.

Reid, Captain Mayne, writer of boys' stories, was born in County Down in 1818, and at twenty emigrated to America, where he led a roving and adventurous life, served in the United States army during the Mexican war of 1847, and distinguished himself especially in the storm of Chapultepec. The Hungarian struggle, in which he had meant to take part, was at an end before he reached Europe, whereupon he settled down to a literary life, first at London, next in Buckinghamshire. He died October 22, 1883. His vigorous style and the profusion of hairbreadth 'scapes he provided delighted his breathless readers, who did not stop to notice the truthfulness of his scenery and the occasional excellence of the narrative style. Among his best books were the *Boy Hunter* (1853), the *Bush Boys* (1856), and the *Boy Tar* (1859), the *Scalp Hunters* (1851), the *Rifle Rangers* (1850), the *War Trail* (1857), and the *Headless Horseman* (1866). See his *Life and Adventures* by his widow (1900; expanded from an 1890 memoir).

Reid, Sir George, was born at Aberdeen, 31st October 1841. Trained as a lithographer, he studied art in the Trustees' Academy, Edinburgh, under Mollinger at Utrecht, under Yvon in Paris, and with Israels at the Hague. He was elected A.R.S.A. in 1870, and R.S.A. in 1877, and succeeded Sir W. F. Douglas as P.R.S.A. in 1891, when he was knighted. He is most widely known by his portraits, which are distinguished by unflinching verisimilitude, vigorous handling, and thorough modelling. His half- and full-lengths are remarkable for their individuality of attitude, for the insight with which, in each case, the characteristics of the sitter are expressed by the entire figure, as well as by the face. Among his more important portraits are 'Lord President Inglis,' in the Scottish Parliament House; 'H. Wellwood Maxwell of Munches;' and 'John Mackenzie.' He has also produced many rich, freely painted flower-pieces, as well as landscape work of a delicate and quiet charm; and his book illustrations prove him one of the most accomplished of living draughtsmen.

Reid, Thomas, head of the Scottish school of Philosophy, was born on the 26th April 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. His mother belonged to the well-known family of the Gregorys (q.v.). Reid began his education at the parish school of Kincardine, and at the age of twelve he became a student of Marischal College in Aberdeen. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the natural philosophy of Newton. In 1736 he left Aberdeen, and went to England, where he was introduced to the most distinguished men in Oxford, Cambridge, and London. In the following year he was presented by the senatus of King's College to the parish church of New Machar in Aberdeenshire. The parishioners were bitterly opposed to his appointment, but his conduct and manner gradually won them over. It is said that, from distrust of his powers, instead of composing for the pulpit himself, he preached the sermons of Tillotson and other English divines. In 1739 Hume's *Treatise on Human Nature* appeared, the perusal of which gave the impulse that determined Reid's future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world. In 1748 he contributed to the Royal Society of London a short essay on *Quantity*. In 1752 he was appointed one of the professors of Philosophy in King's College, Aberdeen, the senatus being the patrons of the chair. Here he followed the established course of teaching in three successive years to the same students mathematics, natural philosophy, and moral philosophy. He was the founder of a Literary Society in Aberdeen, which enrolled among its members Campbell, Beattie, and other men of ability; to this society he submitted his first draft of the *Inquiry into the Human Mind*. In 1763 he was chosen to succeed Adam Smith as professor of Moral Philosophy in the university of Glasgow. In 1764 he published his *Inquiry*. His thirst for general science never left him; at the age of fifty-five he attended Black's lectures on Heat. He continued in the duties of his chair till 1780, when he retired to devote his remaining strength to the publication of his works on the mind. In 1785 the *Philosophy of the Intellectual Powers* appeared, and in 1788 the *Active Powers*—together forming a systematic work on the science of the human mind. In 1774 he had contributed his account of Aristotle's logic to Lord Kames's *Sketches*. The publication of the *Active Powers* was the close of his career as an author, although to the end of his life he kept up his bodily and mental vigour and his interest in science. He was taken ill suddenly in the autumn of 1796, and died on the 7th October.

Like Kant, Reid was roused to metaphysical research by Hume, and became the chief of a school whose aim was to deliver philosophy from scepticism, and to do so by resting finally on principles of intuitive or *a priori* origin. The Scottish philosophy, dominant till Sir W. Hamilton's time in Scotland, and influential in France (see Royer-

Collard), found a zealous defender in M'Cosh (q.v.).

See Common Sense, Scottish Philosophy; the Life by Dugald Stewart prefixed to Reid's works (4 vols. 1803); the edition by Sir W. Hamilton (1853); M'Cosh's *Scottish Philosophy*; and Campbell Fraser's monograph (1898).

Reigate, a thriving market-town of Surrey, pleasantly situated at the southern base of the North Downs, 21 miles S. of London. Of the castle of the Earls of Warrenne little remains save a grassy mound, with large vaults or caverns beneath it. The church, with Transition Norman piers, but mainly Perpendicular, contains the grave of Lord Howard of Effingham, and a library (1701) with some curious MSS. and many of Evelyn's books. Other buildings are the public hall (1861) and the grammar-school (1675). Foxe the martyrologist is claimed for a resident; and Archbishop Usher died here. Till 1832 Reigate returned two members to parliament, and then one till 1867. It was incorporated as a municipal borough in 1863. Pop. (1851) 4927; (1881) 18,662; (1891) 22,646.

Reign of Terror. See Danton, Robespierre.

Reikiavik. See Iceland.

Reima'rus, Hermann Samuel, scholar and theologian, was born 22d December 1694, at Hamburg. He studied at Jena and Wittenberg, travelled afterwards in Holland and England, and was on his return elected rector of the school at Wismar, and subsequently professor of Hebrew and Mathematics at the gymnasium of Hamburg. He died there, 1st March 1768. He is the author of the so-called 'Wolfenbüttelsche Fragmente eines Ungenannten,' first published by Lessing in 1777. These 'Fragmente,' up to that time only known in MS. by a few of Reimarus' most intimate friends, produced the profoundest sensation throughout Germany: since in them the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. Another work in the same direction is his *Vornehmste Wahrheiten der Natürlichen Religion;* of a miscellaneous character are his *Primitia Wismariensia, De Vita Fabricii,* and his edition of *Dio Cassius.* See the monograph by D. F. Strauss (1860; 2d ed. 1878).

Reindeer, or Caribou (*Rangifer tarandus*), a species of deer, the only representative of the genus. It is a native of the northern parts of Europe, Asia, and America, and was introduced into Iceland in 1770. In Caithness it existed till the middle of the 13th century (Harting's *Extinct British Animals,* 1880). It is by far the most valuable of the deer, for not only are the flesh and skin of much use, but the animal has long been domesticated in Scandinavia, especially among the Laplanders. The wild reindeer of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest size being generally attained in the polar regions. The domesticated animal is never so large as the wild one; but that of Siberia is, like the wild one, much larger than that of Lapland. The reindeer is strong, somewhat heavily built, but yet very swift. The hair is longer in winter, and is gray or brownish in colour. The legs are short and thick, and the broad main hoofs spread out as the animal speeds over the snow. Besides the main hoofs, there are two accessory lateral hoofs. The head is carried horizontally, not erect as in other deer. The muffle of the nose is hairy. The antlers are large and are unique in being possessed by both sexes. Moreover, they begin to appear at an early stage in life, within a few weeks after birth, and at the same time in both sexes, whereas in the other deer, in which only the males have antlers, they do not appear before nine months or more after birth. In the female the antlers are somewhat smaller, thinner, and less branched than in the male, and are retained through the winter until the breeding season in spring, after which they are cast. 'The male, on the other hand,' Darwin notes, 'casts his horns much earlier, towards the end of November.' There is great variability in the antlers; 'there is a "bez tine" as well as a "brow tine," which are peculiar in being either branched or palmate.' In summer the Lapland reindeer feeds chiefly on the shoots of willow and birch, while in winter it depends mainly on lichens such as the so-called reindeer moss. It seems that they use both their antlers and their hoofs in removing the snow which hides their food. The animals run swiftly, but not gracefully, taking long sliding strides, and their hoofs snap together as they run. In their natural life the reindeer are gregarious. They migrate from the mountains to the lowlands in winter, and return again in spring, a change in part dependent on the food-supply. Moreover, by leaving the lowlands in spring they free themselves from the gnats and gad-flies, which trouble them very seriously. It is said that the Lapps have to move their herds near the coast in the summer if the health of their stock is to be preserved, and sometimes an immense herd will rush in a headlong race to the sea.

Reindeer (*Rangifer tarandus*).

In North America and elsewhere the reindeer is hunted for the sake of its flesh, fat, and hide. They are shot or trapped in snow pits. The flesh and fat are used in a fresh state or made into pemmican. The skin is used in many ways—for clothing, bedding, and the like. To the Laplanders 'the reindeer serves as a substitute for horse, cow, sheep, and goat,' but its domestication is not very complete. It constitutes the chief part of the Lapp's wealth, and some possess tame herds of two thousand or more, which feed chiefly in the mountainous regions in summer and in the lower grounds in winter. The animal can maintain a speed of nine or ten miles an hour for a long time, and can easily draw a weight of two hundred pounds besides the sledge. Almost every part of the dead animal is used in some way. The reindeer also yields excellent milk.

Reindeer Moss (*Cenomyce rangiferina* or *Cladonia rangiferina*), a lichen of great importance to the Laplanders and other inhabitants of the northernmost regions of Europe and Asia, as forming the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in the Arctic regions.

It is common in Britain, growing in moors and on mountains. It covers extensive tracts in Lapland and other very northern countries, making them even in summer as white as snow, and often thus occupies the ground in pine forests. When pine forests are destroyed by fire it soon springs up in its greatest luxuriance. It is a very variable plant, but always consists of a much-branched erect cylindrical tubular thallus, with small perforations in the axils. It attains a height of two inches and upwards. The branches of plants which grow together usually mix very intricately into one mass. The importance of this lichen was first brought into notice by Linnæus. The reindeer reach it by scraping, even when it is covered with very deep snow. It is capable of being used for human food, though its taste is slightly acrid. Its nutritious qualities depend on Lichenin (q.v.).

Reineke Fuchs. See REYNARD THE FOX.

Reinkens, JOSEPH HUBERT (1821–96), was born near Aix-la-Chapelle, where he worked in a factory before he studied for the priesthood. In 1853 he became professor at Breslau, and in 1873, a strenuous opponent of the infallibility decrees, was chosen bishop by the Old Catholics (q.v.).

Relapsing Fever (also known as *famine-fever* and *seven-day fever*) is one of the three great species of continued fever, the two others being typhus and typhoid. It was first definitely discriminated from these diseases by Dr Henderson of Edinburgh and other Scottish physicians about 1842, but it can be traced back with certainty in the records of disease a century farther, when it was prevalent in Ireland and Scotland. During the 19th century it has been met with in those countries, in England, in central and eastern Europe, the countries surrounding the Levant, North Africa, India, China, and, though never extensively, in North America. Relapsing fever usually begins suddenly with rigors, a sense of chilliness, and frontal headache. Febrile reaction soon sets in, with a temperature of 104° or more, and pulse usually over 100 per minute; the tongue is coated with a thick moist whitish fur; and the skin is often jaundiced (a phenomenon that never occurs in typhus or typhoid fever). There is severe aching pain in the joints and muscles, and great sleeplessness; but delirium, if present at all, usually comes on only towards the end of the first week. After the above-described symptoms have lasted for a period varying from five to eight days, generally on the seventh day, a sudden change takes place. This *crisis* commences with a copious perspiration, which is followed by a rapid falling of the pulse and temperature to or below the normal, and the patient appears nearly well. But from the fifth to the eighth day of this seeming convalescence a sudden relapse occurs, and all the primary symptoms return; these often run a rather shorter course than before, and again terminate in sweating and in a second convalescence, which is in most cases permanent. The relapse sometimes, however, occurs three or even four times. Death is a rare termination of relapsing fever; and when it does occur, it is usually before the seventh day of the disease. No important anatomical lesion is constantly observed in the bodies of those who succumb to this disease, except enlargement of the spleen. One form of the disease, however, is much more severe, and very often fatal. It was originally described as a distinct disease under the name of *bilious typhoid*, and is characterised by more marked implication of the digestive organs, by the constant presence of jaundice, and by absence or incomplete development of the crisis and intermission. It has now been shown to be really identical with relapsing fever proper. Relapsing fever is generally met with among those living under unfavourable hygienic conditions; it is specially apt to attack a population suffering from insufficient nourishment (hence the name famine-fever), and is seldom met with among the upper classes, or among Europeans residing in the tropics, unless they are brought closely in contact with the sick. At the same time it is very infectious, spreading either directly from the patient to doctors, nurses, &c., or from clothes and bedding to washerwomen, who have suffered severely in some epidemics. It was shown by Obermeier of Berlin in 1873 that an organism (Spirillum, q.v.) is constantly present in the blood of those suffering from the disease, and his results have been confirmed by numerous other observers. Moreover, a similar disease has been produced in monkeys by inoculation with the organism, which has also been found in their bodies after death. There can be no doubt, therefore, that this spirillum is the cause of the disease (see GERM THEORY OF DISEASE). Though relapsing fever has been abundantly proved to be distinct from typhus, they are often associated in a curious way; epidemics of the two diseases have frequently been observed to occur in the same place either simultaneously or successively.

Treatment.—The patient, as in other febrile diseases, must be kept in bed; an emetic at the commencement of the attack is often useful, and aperients may be required; a light but liberal diet should be given. Opiates are frequently necessary to relieve the pain and sleeplessness. No means have yet been discovered for cutting short the disease or preventing relapses.

Relations, MAINTENANCE OF. According to English law, a husband is bound to maintain his wife; if he refuses or neglects to do so, or makes it impossible for her to live with him, she has an 'authority of necessity' to pledge his credit for the necessaries of life. Under the statutes relating to the poor a husband may be punished for deserting his wife, and compelled to provide for her maintenance; the husband of a lunatic wife may be compelled to contribute to her maintenance in an asylum. Under the Married Women's Property Act, 1882, a woman who has property may be compelled to contribute to the maintenance of her husband. At the common law a parent is not legally bound to maintain a child; but he may be indicted for not supplying an infant child with necessaries. In like manner a child is not bound at common law to maintain his parents. But the poor-law of 1603 imposes a direct liability on the father, grandfather, mother, grandmother, or children of any person not able to work; and by a subsequent act a man who marries a woman having children (legitimate or illegitimate) must maintain such children. Bastard children are to be maintained by the mother; but the father may be summoned before justices and ordered to pay a weekly sum to the mother, or to a person appointed by the justices. A grandchild is not liable to maintain a grandparent, nor can a man be required to maintain persons related to him only by affinity (as e.g. a son's wife), or a collateral relation (as e.g. a brother or nephew). In Scotland the father, and failing him the mother, is bound to maintain children until they are old enough to earn a livelihood; a father refusing to provide for his child is punishable by fine or imprisonment. Parents have a claim on their children, and a husband is bound to maintain the indigent parents of his wife during the subsistence of the marriage. The father of an illegitimate child is bound to support it, and if the child is unable to earn a livelihood the obligation may last throughout its life. A husband is, of course, bound to support his wife; if he refuses to

do so she may sue for aliment, and he is liable to her creditors for alimentary debts. In the United States the laws of the states vary; but the duty to support wife, children, and parents is generally recognised, and it is usually made a penal offence to abandon wife or children.

Relative Keys. See SCALE.

Relative Rank. See RANK.

Relativity of Knowledge. The doctrine of the relativity of knowledge is almost a commonplace in some philosophical schools, and is as strenuously denied by others. It is connected primarily with the contrast between the absolute and the relative, or the noumenon and phenomenon, and is one phase of the great discussion as to the relation of knowledge to reality. In its modern form the doctrine has obtained currency chiefly through the speculations of Kant, Hamilton, and Mr Herbert Spencer. Knowledge evidently implies a knower and a relation between the knower and the object known. Hence it is argued that the object is conditioned by the relation into which it is brought; merely by becoming an object the thing as it is in itself undergoes a change or accommodation. Our knowledge therefore can never yield us the reality of things—the noumenon or thing-in-itself—but only the phenomenon, the thing as it appears to us. Or, as it is otherwise expressed, in being known the object must conform to the nature of the knowing faculty, the mental constitution or organisation of the knower; we cannot, therefore, conclude, says Hamilton, that the properties of existence are known 'in their native purity and without addition or modification from our organs of sense, or our capacities of intelligence.' Hamilton's general conclusion is: 'Of things absolutely or in themselves, be they external or be they internal, we know nothing, or know them only as incognisable; and we become aware of their incomprehensible existence only as this is indirectly or accidentally revealed to us, through certain qualities related to our faculties of knowledge. All that we know is therefore phenomenal, phenomenal of the unknown.' This is adopted by Mr Spencer, and made the basis of his theory of knowledge, or rather of what Ferrier would have called his agnoiology, his doctrine of our necessary ignorance: 'The reality existing behind all appearances is, and must ever be, unknown.' In Kant a similar doctrine is associated with the asserted subjectivity of the forms of space and time; but it is also based upon the broader consideration that perception can give us 'only the relation of an object to the subject, not the inward essence which belongs to the object in itself.' The empirical schools, which resolve our knowledge into impressions of sense manipulated according to the laws of association, likewise accept in its widest sense, as J. S. Mill points out, the doctrine of 'the entire inaccessibility to our faculties of any other knowledge of things than that of the impressions which they produce in our mental consciousness.' But, inasmuch as they in many cases profess a sceptical idealism which denies, or leaves doubtful, the existence of any reality beyond the states of consciousness, their views are less usually associated with the term.

The starting-point of the above argument must be conceded by all. Knowledge obviously implies relation; it exists only through the duality of knower and known, this duality being as necessarily present in the case of what is called self-knowledge as in the case of knowledge by self of independent objects. But the upholders of the doctrine of relativity proceed to convert this essential feature of intelligence into a proof of the 'impotence' of our faculties. For the term is used in such a way as to imply a taint or defect in our knowledge. Our knowledge is condemned because it fails to realise a certain ideal. The question arises, however, whether the ideal proposed is in any sense legitimate or possible. What is this 'reality existing behind all appearances,' this thing in itself that so persistently evades our grasp? The answer of a sound philosophy would seem to be that this unknown essence or noumenal reality is a fictitious entity of our own creation. The essence or nature of a thing is expressed in its qualities or action; the noumenon reveals itself in the phenomenon. The relativists are in the habit of saying that 'we know only phenomena,' thus making our knowledge of phenomena the ground of our ignorance of the corresponding noumena. But, strictly speaking, it is a misuse of language to say that we know phenomena; the phenomenon is our knowledge of the noumenon. To say that we know phenomena is therefore only a roundabout way of saying that we know, and what we know is the noumenon or thing-in-itself. Of course the contrast between knowing and being is not abolished according to this view; in human knowledge, at all events, the existence of objects is independent of our knowledge of them. It is this contrast between the thing as existent and the thing as known that lends plausibility to the doctrine of relativity. But the contrast only justifies us in saying that knowing a thing is not the same as being that thing; whereas the relativistic doctrine says that, *ipso facto*, to know a thing is not to know the reality of the thing. Knowledge, in this view, infallibly cuts us off from knowing.

Apart from this general line of thought, the doctrine is frequently based upon the large extent to which sensation enters into all our knowledge. In the structure of their sense-organs different living creatures differ appreciably, and there will be a corresponding difference in the image of the world which they make to themselves. The knowledge of every being, it is argued, is thus inevitably conditioned by its organisation, and there is no possibility of arriving at an objective criterion. Man, in the Protagorean formula, is the measure of all things; but he measures them only as they seem to him. Such a formula may be interpreted either in a sensationalistic and individualistic fashion, as seems to have been done by Protagoras, or in a rationalistic and humanistic fashion, as is seen in Kant. The former interpretation leads to a sceptical dissolution of knowledge, for it leaves no common ground on which individuals might meet. Kant, by making space and time, if not the categories also, forms peculiar to the human intelligence, but common to all men, provides for objective truth between man and man, but insists on the merely human and relative character of such truth. Apart from the assertion of the merely subjective character of space and time, which Kant can hardly be said to have proved, it is evident that the relativist argument applies with most force to what are called the secondary qualities, such as tastes, smells, sounds, and colours. But when we consider the elevated pleasures of which the last two, at all events, are the source, we may well hesitate about pressing the relativistic argument too far. Things do not exist on their own account as bald brute facts, on which intelligence afterwards supervenes, to make what use of them it can. It seems truer to believe that to be known and enjoyed by spiritual beings is the purpose of their existence. The relativity of the world to the human senses and intellect would then form no ground for believing that the image of the world thus obtained was in any sense distorted or untrue. We may rise to higher insight and more perfect æsthetic appreciation, but that our know-

ledge is finite and subject to revision does not deprive it of validity or objective truth in its own time and place. The case for the relativity of knowledge will be found strongly put in Sir W. Hamilton's *Discussions* and *Lectures on Metaphysics*, in Dean Mansel's Bampton Lectures, and in Mr Herbert Spencer's *First Principles*.

Relics (Gr. *leipsana*, Lat. *reliquiæ*, 'remains'), personal memorials of those among the dead who have been distinguished during life by eminent qualities: especially, in the history of the church, objects which derive their value from their connection with our Lord and with the saints; as, for example, fragments of our Lord's cross or crown of thorns, portions of the dust, the bones, the blood, the instruments of torture, the chains, &c. of the martyrs, the mortal remains, the clothes, the books, and other objects of personal use of the other saints. With them may be grouped objects to which a certain indirect sacred interest is given by their being brought into contact with the direct memorials of the distinguished dead, as by their being placed on the tombs of the martyrs, touched with the relics, or blessed at the shrine or sanctuary of the saints, &c. Reverence for relics developed with the increasing honour paid to Martyrs (q.v.).

The earliest monuments of Christian history contain evidences of the deep and reverential affection with which martyrs of the faith, their mortal remains, and everything connected with their martyrdom were regarded by their fellow-Christians, and for which Catholics profess to find warrant in many passages of the Old and of the New Testament, as Ex. xiii. 19; 2 Kings, xiii. 21, and xxiii. 16–18; Matt. ix. 20–22; Acts, v. 12–16, and xix. 11, 12. The letter of the Church of Smyrna attests this plainly as to the martyrdom of Polycarp; Pontian's *Life of Cyprian* tells of their stealing the martyr's body, and carrying it away by night in holy triumph. The Apostolical Constitutions bear witness to the honours paid. Miracles, too, are described as connected with relics. Thus, Ambrose tells of a blind man's sight restored by his touching the bodies of the martyrs Gervasius and Protasius; and similar wonders are detailed by Gregory Nazianzen, Chrysostom, and Leo the Great; so that the possession of relics of the martyrs, and even the occasional touching of them, was regarded as a special happiness. According to Theodoret, even cities were content to share with each other portions of the sacred treasure. Connected with this feeling, too, is found a belief of a certain sacred efficacy in the presence or the touch of the relics; and especially there is ascribed by Chrysostom, Basil, Theodoret, and other Fathers, to prayers offered before the relics, a virtue in dispelling or warding off sickness, diabolical machinations, and other evils. Hence we find that altars were erected over the tombs of the martyrs, or at least that relics were invariably placed on the altars, wherever erected; insomuch that the Trullan Council ordered the demolition of all altars in which no relics had been deposited. Far more sacred than the relics of martyrs was the cross of our Lord, which was believed to have been discovered at Jerusalem by Helena (q.v.), mother of the Emperor Constantine. Minute portions of the wood were distributed to the principal churches; and Cyril of Jerusalem, within less than a century after the discovery of the cross, describes the precious wood as dispersed throughout the world. According to Rohault de Fleury's *Mémoire sur les Instruments de la Passion*, 'the total cubic volume of all the known relics of the True Cross is about 5,000,000 cubic millimetres, whereas a cross large enough for the execution of a man must have contained at least 180,000,000 or thereby.' The practice of relic-worship, and the feeling on which it was founded, were not suffered to pass without a protest. At quite an early period many abuses and superstitions had crept in, which even the Fathers who admit the worship do not fail to condemn; and Vigilantius, in a treatise now lost, reprobated in the strongest terms the excesses to which it was carried, and indeed the essential principles on which the practice rests. He had so few followers, however, that were it not for the refutation by Jerome of his work against relics we should have no record of his opposition to the popular view; and it is urged by Catholics, as a proof of the universal acquiescence of the church of the 4th century in the practice of relic-worship, that it was not even found necessary to call a single council to condemn Vigilantius.

The writings of Augustine, of Paulinus of Nola, of Ephraem the Syrian, of Gregory the Great, and others are full of examples of the miraculous virtue ascribed to relics, and of the variety and the extensive multiplication of sacred memorials of all kinds. Nor was this confined to the orthodox alone; all the different parties in the controversy on the Incarnation agreed with Catholics and with one another on this subject, and even the Iconoclasts, at the very time that they most fiercely repudiated the use of images, admitted without difficulty the veneration of relics.

In the age of the Crusades a fresh impulse was given to the worship of relics in the West by the novelty and variety of the sacred objects brought home from the churches of Syria, Asia Minor, and Constantinople by crusaders, by palmers returning from Palestine, and by the Latin conquerors of Constantinople; and it is admitted by the most zealous Catholics that at this period many false, and perhaps even absurd and ridiculous relics were introduced, and were successfully commended to the veneration of individuals or individual churches in the West; nor do they venture to doubt that abuse and superstition found their way side by side with what they regard as the genuine and authorised worship of the church. Nevertheless, with the exception of the Waldenses, Wyclif, and a few isolated individuals, the practice remained unchallenged till the 16th century, when, in common with many other doctrines and practices of the Church of Rome, it was utterly repudiated by the Reformers. Catholics, however, allege that the practice, as sanctioned by the church, has nothing in common with the abuses which form the main ground of the objections alleged by Protestants. The Roman Catholic use of relics, as authorised by the church, is to serve as incentives to faith and piety, by recalling vividly to men's minds the lives, and, as it were, the corporeal presence and the earthly converse of the saints, and thus placing before them, in a more touching manner, the virtues which, in the examples, are held up for men's imitation. The decree of the Council of Trent connects the subject of relic-worship with the general question of saint-worship, and regards the relics of the saints not as possessing intrinsic virtue, but only as instruments 'through which God bestows benefits on men.' The Fourth Lateran Council (1215) forbade the sale or veneration of relics until their authenticity had been approved by the authorities; the Council of Trent renewed the prohibition. In the pastoral of the Bishop of Treves, inviting pilgrims to the exhibition of the Holy Coat (1891), it is expressly stated that 'the authenticity of no relic, be it the most eminent of the oldest church of Christendom, falls under any precept of Catholic faith.' Relics are usually venerated in costly cases or 'reliquaries' set on the altar; they are also carried in procession, and the faithful are blessed with them.

The Greek and other Oriental churches, and most of the Oriental sects, agree with Roman

Catholics in the practice of relic-worship. On the contrary, the Reformed churches, without exception, have rejected the usage; though non-religious relic-worship is rife enough, in the form of swords of Wallace and Bruce, locks of Prince Charlie's hair, &c. The practice of relic-worship forms a notable feature of the Mohammedan usage of pilgrimages, and is an even more important feature of Buddhism.

Relief, as distinguished from 'sculpture in the round,' is one of the oldest forms of mural decoration, and in many cases is a subordinate department of architectural art rather than a branch of sculpture proper. It is low relief (bas-relief, basso-rilievo), middle (mezzo-rilievo), and high relief (alto-rilievo) according as the carved figures project very little, in a moderate degree, or in a very considerable degree from the background. The ancient Egyptians practised a peculiar kind of low relief and intaglio combined (see EGYPT, Vol. IV. p. 237). The wall-sculptures of Assyria (q.v.) and Babylonia (q.v.) are mostly in very low relief. The Elgin Marbles (q.v.), from the Parthenon of Athens, are the most notable example of high relief. See SCULPTURE.

Relieving Officer. See POOR-LAWS.

Religion. The term has since the 16th century become naturalised in most European languages. It has even in the Teutonic tongues taken the place of the native terms formerly in use. As to its etymology, the derivation from *relinquere* is universally recognised to be inconsistent with phonetic laws; the necessity for assuming the existence of a lost transitive verb *ligere*, 'to look,' has not been made out; and the derivation from *relegere* (Cicero, *Nat. Deor.* ii. 28), which implies *carefulness and attention* to what concerns the gods to be the primary signification of the word, is better than that from *religare* (Lactantius, *Inst. Div.* iv. 28), which refers the origin of religion to a sense of *dependence on or connection with Deity by the bond of piety*, inasmuch as the latter does not accord with the way in which the ancient Romans used the terms *religens* and *religiosus*, and supposes in them a higher conception of religion than they are likely to have possessed. The Lactantian derivation, however, has not been shown to violate any known linguistic law; and the reason which Professor Max-Müller gives (*Natural Religion*, p. 35) as 'the real objection' to it does not apply to it at all. It is *not* 'the fact that in classical Latin *religare* is never used in the sense of binding or holding back.' Binding or holding back, or behind, or fast, is its common meaning in classical Latin; it is its meaning in Cæsar, Cicero, Suetonius, Virgil, Horace, and Ovid. Its only other meaning is to *unbind*.

General terms equivalent in meaning to religion are not to be found even in such languages as Chinese, Sanskrit, Hebrew, or Arabic, and need not of course be looked for in the languages of uncultured peoples. There is no definition of religion in the Bible, nor any designation or description of it which applies to the heathen religions. The Fathers and Schoolmen attempted only to give a definition of *true* religion. The difficulty of framing a correct definition of religion is very great. Such a definition ought to apply to nothing but religion, and to differentiate religion from everything else, as, for example, from imaginative idealisation, art, morality, or philosophy. It should apply to everything which is naturally and commonly called religion; to *religion* as a subjective spiritual state, and to all *religions*, high or low, true or false, which have obtained objective historical realisation. And it should neither expressly nor by implication exclude any essential element of religion, but express in a general way all that is necessarily included in its nature, indispensable to its notion. Since the need for definitions of this kind was felt—i.e. since the comparative study of religions began to be cultivated—numerous attempts to supply it have been made, but few, if any, of the definitions of religion as yet proposed fulfil all the requirements. Those of Kant, Fichte, Schleiermacher, Hegel, Strauss, Wundt, Pfleiderer, Herbert Spencer, Matthew Arnold, Tylor, John Caird, and Max-Müller have attracted most attention.

The classification of religions also presents great difficulties. To distribute them into (1) true and false religions, or (2) natural and revealed religions, or (3) natural and positive religions, or (4) religions of savage and of civilised peoples, or (5) book-religions and religions not possessed of sacred books, or (6) individual religions (i.e. founded by great individual teachers) and national or race religions (i.e. the collective products of peoples or races, the growth of generations), must obviously be scientifically inadequate and unsatisfactory, although some of the classifications thus obtained may not be without truth or interest. Max-Müller holds that 'the only scientific and truly genetic classification of religions is the same as that of languages,' and Maurice Vernes that they must be classified according to races. And there can be no doubt that, if religions, languages, and races are properly classified, the classifications will, on the whole, correspond or coincide. Still they ought to be classified independently, from a study of their own proper natures, and a complete accordance of their classifications is not to be looked for. The fact, for instance, that there are universal religions, religions not limited by language or race, must not be ignored or depreciated. Hegel's classification is very ingenious and suggestive. He distributes religions into religions of nature, religions of spirituality, and the absolute or Christian religion, answering respectively both to the chief stages of the historical realisation of religion, and to the childhood, youth, and manhood of humanity. The religions of nature are represented as including (1) immediate religion (sorcery and fetish-worship); (2) pantheistic religion, which comprehends the religion of measure (China), the religion of phantasy (Brahminism), and the religion of being-in-itself (Buddhism); and (3) religion which tends to freedom, and which is exemplified in the religion of the good or of light (ancient Persian), the religion of sorrow (Syrian), and the religion of mystery (Egypt). The religions of spirituality are held to be these three—the religion of sublimity (Hebrew), the religion of beauty (Greek), and the religion of the understanding (Roman). The classification of Von Hartmann is of the same character, being very ingeniously conformed to the needs of his own philosophy, and yet not conspicuously inconsistent with the facts. The classifications of Lubbock, Tylor, Spencer, Reville, and D'Alviella deserve attention as being based on an extensive and close study of religions, including those vague and rude religions to which it is especially difficult to assign appropriate places in a natural and comprehensive scheme of distribution. No general agreement, however, has been as yet reached either in determining the species of these religions or the order of their succession.

Professor Tiele classifies religions as follows: I. Nature religions, which comprehend (*a*) Polydæmonistic magical religions under the control of animism; (*b*) Purified or organised magical religions—Therianthropic polytheism, (1) unorganised and (2) organised; (*c*) Worship of manlike but

superhuman and semi-ethical beings—Anthropomorphic polytheism. II. Ethical religions, which are either (*a*) National nomistic (nomothetic) religious communities — Taoism, Confucianism, Brahminism, Jainism and Primitive Buddhism, Mazdaism, Mosaism, and Judaism; or (*b*) Universalistic religious communities—Islam, Buddhism, Christianity.

Religion is virtually universal, although, of course, neither the possibility nor the existence of atheism can be reasonably denied. The instances which Büchner, Lubbock, and others have adduced to prove that there are whole peoples destitute of religion will not stand the test of examination (see Flint, *Antitheistic Theories*, Lecture vii. and Notes xxv.–xxxi., and Roskoff, *Religionswesen der rohesten Naturvölker*). Not one adequately attested case of the kind has yet been produced; and even if such a case were established it would go only a very little way towards proving that man is not naturally and normally a religious being.

The starting-point of religious development has been variously represented as fetichism (De Brosses, Comte, Tylor), belief in ghosts (Spencer, Caspari, Le Bon), polytheism (Hume, Voltaire, Dupuis), pantheism (Tholuck, Ulrici, Caird), henotheism (Schelling, Max-Müller, Von Hartmann), and monotheism (Creuzer, Professor Rawlinson, Canon Cook). All these representations are conjectural. The present state of our knowledge does not enable us to decide what the primitive religion was. Historical research does not take us back to it. Nor does it show us what stages of religion intervened between it and the earliest known historical religions. The ways in which the ruder phases of religion are represented by anthropologists and comparative theologians as having succeeded one another are merely more or less suggestive hypotheses, founded on data both insufficient and ambiguous. All serial arrangements of the kind ought to be regarded as of a merely logical, non-historical character, although they may, perhaps, aid in leading to a discovery of the historical order of development. Hence the best mode of arranging the ruder religions may be that which begins with the logically simplest phase of religion, and assigns the others a place in the order of their logical dependence and complexity. Adopting this principle, Naturism, the worship of natural objects regarded as powers or agents will come first, implying as it does no original or special faculty or tendency, and being the direct and natural interpretation of physical facts. It may have many forms corresponding to the differences of the natural objects, and these forms may imply very different degrees of intellectual capability and very different qualities of disposition in the worshippers, although they have certainly not been shown to be successive stages of religious development. Nature-worship affords a basis for all other forms of religion and worship, and in most of them its presence as a constituent is obvious. It is difficult, if not impossible, to conceive how men could have risen to any higher stage of religion except by means of it; or how they could have failed to enter it unless raised above it by a special revelation. And the notion of a special revelation to men who had not by natural means acquired any belief in or thought of deity is scarcely conceivable. Animism comes next as a natural result of the growth of the idea of soul. It is often indistinguishable or difficult to distinguish from nature-worship, which is, as it were, *implicit* animism, while animism is *explicit* nature-worship. When man has drawn a distinction between body and life or soul, it is natural that he should work it out in regard to himself, and then judge of other things by himself; and the phenomena of sleep and dreams, of swooning, apoplexy, ecstasy, insanity, and death, all contribute to mould his thoughts when once they have been turned in this direction. Hence a third phase of religion, Spiritism, in which the souls worshipped are human, or conformed to the human type and conceived of according to human experience, but affected and modified by physical impressions and analogies. The hypothesis of Mr Spencer that religion begins at this stage, the first deities being deceased ancestors, and the first worship funeral rites, takes no account of a vast mass of philological evidence which establishes that the names of the oldest known gods were descriptive of natural phenomena, and of historical evidence which shows that ancestor-worship has been grafted in various localities on an older nature-worship. It also rests on a very improbable assumption as to savage man's mode of viewing natural objects worshipped, and fails to explain the common features, similarities, and analogies in the various mythologies, the transformations of the *ghosts* into *gods*, the inferior position of properly ancestral gods, and especially the characteristics of nature-worship. The fourth phase of religious development is Polytheism in the special sense of the term, anthropological mythology, the worship of divine individualities, generally in origin nature-gods, but transformed by imagination operating under the belief that beings analogous to the human rule the course of things. The fifth phase is that in which polytheism is subordinated to, or reduced under, a Dualistic or Monistic conception of the divine. The conception may be mainly reached either by speculative or ethical thought. The sixth phase is represented by the Monotheistic religions—the Jewish, Christian, and Mohammedan. These religions all claim to rest on special revelation. In them only is belief in a plurality of gods entirely transcended. Philosophical monism in a religion does not cast out polytheism. Fetichism, image-worship, totemism, shamanism, and sorcery probably should be regarded not as distinct phases or natural logical stages of religious development, but as adjuncts and incidental perversions of religion which presuppose its normal or logical phases or stages. An adequate proof of this view would necessarily dislodge and destroy a number of current hypotheses.

The theories regarding the psychological origin and the essence of religion are numerous and divergent. It was common among the atheists of the 18th century to speak of religion as the invention of individuals desirous of deceiving their fellow men in order to further their own selfish and ambitious views. Feuerbach, Lange, Spencer, and others account for its appearance by imagination, illusion, or the misinterpretation of ordinary or exceptional phenomena. Some zealous supernaturalists have argued that it must have originated in a primitive revelation. It may be referred exclusively to the intellectual province of human nature. This mistake, however, is too gross to have been often committed, and is sufficiently refuted by the obvious consideration that the measure of religion is not the measure of intelligence or of knowledge. Hegel did not, as is often said, fall into the error of identifying religion with thought, but only emphasised strongly the importance of thought in religion. Peschel regards the principle of causality, and Max-Müller the perception of the infinite, as the roots of religion. And it may well be admitted that without both of these intellectual principles religion would be impossible. But are they more than merely *conditions* of its appearance? The origin of religion is, of course, referred to intellect by those who hold that God is known intuitively, perceived directly, apprehended with-

out medium; but both psychology and history, both internal analysis and external observation, seem to disprove this hypothesis. Religion has often been resolved into feeling or sentiment. Thus Lucretius, Hobbes, and Strauss have traced it mainly to fear; the followers of Ritschl to a desire to secure life and its goods amidst the uncertainties and evils of earth; the disciples of Schleiermacher to a feeling of absolute dependence, of pure and entire passiveness; and others—e.g. Brinton and Newman Smyth—to the religious feeling regarded either as a distinct primary feeling or a peculiar compound feeling. Kant represented religion as essentially a sanction for duty, and Matthew Arnold has defined it as 'morality touched by emotion,' 'ethics heightened, enkindled, lit up by feeling.' This great diversity of views of itself indicates what investigation is found to confirm—viz., that religion is a vast and complex thing, an inexhaustible field for psychological study. Almost all the views referred to have some truth in them, and most of them are only false in so far as they assume themselves to be exclusively true. The whole nature of man has been formed for religion, and is engaged and exercised in religion. Every principle of that nature which has been singled out as the root of religion has really contributed to its rise and development. The study of religion as a process of mind, and of the factors which condition and determine its development, is the special task of the psychology of religion, a department of research to which many contributions have been made since Hume initiated it in his *Natural History of Religion* (1759) by showing the importance of the distinction between the *causes* and the *reasons* of religion.

A religion is a group or whole of religious phenomena—of religious beliefs, practices, and institutions—so closely connected with one another as to be thereby differentiated from those of any other religion. Each religion has had a history, and its rise and spread, formation and transformations, as a religion can only be truly traced by being historically traced. Also religions are historically connected, are related to one another, and have influenced one another, in ways which may be discovered, and can only be discovered, by historical research. Hence the History of Religions is also the history of religion, not an aggregation of the histories of particular religions, but a truly general history. Like the histories of art, industry, science, and society in general, it is found on examination to have been a process of development in which each stage of religion has proceeded gradually from antecedent factors and conditions. The precise nature of the development can only be ascertained by investigation of the history itself. No hypothesis of development should be assumed as a presupposition of such investigation. Naturalistic apriorism is as illegitimate in historical inquiry as theological or metaphysical apriorism. The history of religion is not only of great importance in itself, but indispensable to the right understanding of general history, of the history of art, of philosophy, &c. It has been studied with more zeal and success during the 19th century than in all the preceding ages. The history of religious beliefs is, of course, only a part of the history of religions. It is, however, distinguishable, although inseparable, from it, and is often and conveniently designated Comparative Theology. It comprehends comparative mythology and the history of doctrines, myths being beliefs which are mainly the products of imagination and doctrines of reflection.

The Psychology of Religion, the History of Religions, and Comparative Theology are clearly distinct, and ought not to be confounded. At the same time they are closely connected. They agree in that they are alike occupied with religion as an empirical fact. Hence they may be regarded as parts of a comprehensive science, to which it might be well to confine the designation 'Science of Religions,' instead of using it in the vague and ambiguous way which is so common. Thus understood, the Science of Religions may be said to deal with religion as a phenomenon of experience, whether outwardly manifested in history or inwardly realised in consciousness; to seek to describe and explain religious experience so far as it can be described and explained without transcending the religious experience itself. Its students have only to ascertain, analyse, explain, and exhibit experienced fact. Were religion a physical fact, to study it merely as a fact would be enough. The astronomer, the naturalist, the chemist have no need to judge their facts; they have only to describe them, analyse them, and determine their relations. But it is otherwise with the students of religion, of morality, of art, of reasoning. They soon come to a point where they must become judges of the phenomena and pronounce on their truth and worth. Experience in the physical sphere is experience and nothing more; experience in the spiritual sphere is very often experience of what is irreverent and impious, immoral and vicious, ugly and erroneous, foolish or insane. Has the mind simply to describe and analyse, accept, and be content with such experience? Even the logician and the æsthetician will answer in the negative, will claim to judge their facts as conforming to or contravening the laws of truth and the ideals of art. Still more decidedly must the moralist and the student of religion so answer. Religion, then, is not completely studied when it is only studied historically. Hence it must be dealt with by other sciences or disciplines than those which are merely historical. What these are, and how they are related to religion, the writer has elsewhere endeavoured to show.

All the particular theological sciences or disciplines treat of particular aspects of religion or of religion in particular ways. Their relationships to one another can only be determined by their relationship to it. They can only be unified and coordinated in a truly organic manner by their due reference to it. When religion is studied not merely in particular aspects and ways, but in its unity and entirety, with a view to its comprehension in its essence and all essential relations, it is the object of the Philosophy of Religion. Although a distinct and essential department of philosophy, and the highest and most comprehensive theological science, the philosophy of religion could only appear in an independent and appropriate form when both philosophy and theology were highly developed. It is, therefore, of comparatively recent origin, and indeed has been chiefly cultivated in Germany during the 19th century.

The *Hibbert Lectures* of Max-Müller, Renouf, Kuenen, Rhys Davids, Sayce, and Rhys; Max-Müller's *Natural Religion* and *Physical Religion;* Tiele's *Outlines of the History of Religion*, and art. 'Religions' in *Ency. Brit.;* De La Saussaye's *Lehrbuch der Religionsgeschichte;* A. Lang's *Myth, Ritual, and Religion;* Reville's *Religions des Peuples non-civilisées*, &c., treat of the history of religion. Alliott's *Psychology and Theology*, Newman Smyth's *Religious Feeling*, Brinton's *Religious Sentiment*, D. Greenleaf Thompson's *Religious Sentiments of the Human Mind*, Happel's *Anlage des Menschen zur Religion*, and Ulrici's *Gott und Mensch* deal with the psychology of religion. There are two valuable works on the history of the philosophy of religion—Pfleiderer's (trans. by Stewart and Menzies) and Pünjer's (trans. in part by Hastie); also treatises on *Religionsphilosophie* by Hegel, Krause, Ohlert, Taute, Apelt, Stöckl, Hartmann, Teichmüller, and Rauwenhoff. Of works in English,

see books on the philosophy of religion by Morell, Caird, Morris, Lotze (trans.) and Sabatier (trans. 1897); and Jevons, *Introduction to the History of Religion* (1896). There are, besides the relevant paragraphs on religion in the articles on Assyria, Babylonia, Egypt, Etruria, Greece, India, Japan, Rome, &c., separate articles on the various religions of the world, sects Christian and other, and religious doctrines throughout this work, including those on

Remainder is a term much used in the law of England. Thus, if the owner of the fee-simple, or freehold of lands, give them by will or deed to A for life, and after his decease to B and his heirs, the interest of B is called the remainder, because, after deducting A's life estate, all that remains belongs to B. A remainder is distinguished from a reversion in this, that in the latter case the land returns or reverts to the owner himself. Remainders are used in settlements for the purpose of fixing the succession and tying up the property, so far as the law will permit. See PERPETUITY.

Remak, ROBERT (1815-65), physician and physiologist, became a professor in Berlin, and distinguished himself by microscopic work in pathology and embryology, and by the medical application of electric currents. He wrote works on the development of the vertebrates and on the medical uses of electricity.

Rembang, a town on the north coast of Java, capital of a residency that has an area of 2896 sq. m. and a pop. of 1,176,580.

Remembrancer, KING'S or QUEEN'S, an officer of the old Exchequer of England, whose duty it was to remind the judges of that court at the proper times that such and such things had to be attended to, and also to keep certain records and make out processes. Since the constitution of the Supreme Court (q.v.) the queen's remembrancer has been at the head of a department of the central office of that court. The Scottish exchequer is still presided over by the queen's and lord treasurer's remembrancer.

Rembrandt. The name 'Rembrandt' was a baptismal name only, which occurs in various forms. Rembrandt's initials were R.H.—i.e. Rembrandt Harmenszoon, or son of Harmen, and his father's full name was Harmen Gerritszoon van Rijn, or Harmen the son of Gerrit, living on Rhineside. The local indication, van Rijn, is used in deeds after 1600 A.D. Rembrandt is now often called Van Rijn, but never Harmenszoon. At the time of the artist's birth his family was of the lower middle class, and in prosperous circumstances, living at Leyden, and holding property there. From the register of marriages and from a date on an etching, Vosmaer accepts July 15, 1607, as the true birth date. Rembrandt's father was a miller, and his mother, Neeltjen van Suydtbrouck, a baker's daughter. They had seven or eight children, of whom two died young, Rembrandt being the youngest but one. All the boys were brought up to trade except Rembrandt, whose father wished to give him a classical education; but he had no taste for Latin, so he went to learn painting in the studio of Van Swanenburch, probably in his twelfth or thirteenth year. Orlers says that he worked with Van Swanenburch three years. This master came of a good family, and had visited Italy. Rembrandt's next master was Pieter Lastman, but he stayed with Lastman only six months. He probably returned to his father's house about 1623, and stayed there till 1630. Already he had begun to paint old age; there are several pictures of that date representing old people, as well as careful studies. He began his career as an etcher very early, and etched beggars and picturesque heads, including his own, also a first biblical subject, 'Jesus presented in the Temple.' There are no less than thirty etchings for the year 1630, when the artist was only twenty-three. In the same year he migrated from Leyden to Amsterdam, then a picturesque city of 100,000 inhabitants, and there he set up a studio and took pupils. Already one of the most industrious and productive artists that ever lived, Rembrandt found time to paint several biblical subjects, besides a number of portraits, and to etch forty plates in the year 1631, whilst his progress in art was so rapid that he painted one of his most important masterpieces, 'The Anatomical Lesson,' in 1632, at the early age of twenty-five. He married Saskia van Ulenburgh in June 1634. She was of a good family, twenty-one years old, and the youngest of nine children. The pair settled in a large house in the Breedstraat in Amsterdam. There is good evidence that the marriage was happy, and we know Saskia by the portraits her husband made of her. After marriage he continued to be very industrious, even the year of marriage having a harvest of several religious pictures and many portraits, as well as fifteen etchings. The artist was also in the habit of producing many sketches and drawings. Vosmaer observes that these are either studies from nature or notes taken rapidly, or else embryos of ideas caught as they formed themselves, with a rude pen and a wash, or a few strokes of black stone.

Rembrandt had a daughter, Cornelia, born in July 1638, but she died the month following. A second Cornelia was born in 1640, who also died young, and a son, Titus, in 1641. His father died about 1632, and his mother about 1640, after having been frequently portrayed by her son both in painting and etching. Saskia died prematurely in 1642, after only eight years of marriage. Between the death of his mother and that of his wife, Rembrandt's activity developed itself in three branches, portrait, small biblical or genre pictures, and large canvases with figures the size of life. The year of Saskia's death is also that of the famous picture known as the 'Night Watch.' An important branch of Rembrandt's artistic production from 1643 to 1650 was landscape, which he continued to practise more or less till 1659, both in etching and painting. After the death of Saskia the domestic life of the artist becomes obscure. In 1654 his servant Hendrickie Jaghers had a child by him baptised as Cornelia, and after his death one Catherina van Wijck is mentioned in the register as his widow, but it is unknown whether she was a second or a third wife, and at what date her marriage took place. It is not precisely known what were the causes of Rembrandt's bankruptcy in 1656. He was an ardent collector, willing to give high prices, and as his family fell into embarrassed circumstances, it is likely that he helped them. His art, too, became unfashionable; but he did not relax his diligence. His collection fetched only 5000 florins at the sale. Vosmaer believes, however, that he had found evidence of a return to partial prosperity, and that Rembrandt was able at least to rent a commodious and handsome house near the Rozengracht. After continuing to work with constant energy and undiminished power, he died October 8, 1669, following his son Titus, who died a year earlier. Titus left a posthumous

daughter, Titia, and Rembrandt was present at the baptism. He was spared the pain of losing this grandchild, whose death occurred thirteen days after his own. Rembrandt left two children, names unknown.

The genius of Rembrandt has been the subject of much controversy, but his fame has increased, notwithstanding unintelligent censure and praise often equally unintelligent. Rembrandt was not blind to the merits of Italian art, as we know by his collection, but his own practice was founded on the direct study of the nature he saw around him both in human life and landscape. It is a mistake, however, to suppose that he copied nature slavishly, that he was a sort of photographer. Far from that, he was so imaginative that he transmuted everything. He had an equal power of expressing mass and rendering detail both in painting and etching. His technical force in both arts has only been rivalled in other styles, and it has never been surpassed. The common admiration for his chiaro-oscuro is, however, misplaced. The chiaro-oscuro of Rembrandt is often false and inconsistent, and, in fact, he relied largely on public ignorance. But though arbitrary it is always conducive to his purpose. In etching the effect of it was often heightened by an intentionally unequal distribution of finish. No artist ever combined more delicate skill with more energy and power. His treatment of mankind is full of human sympathy for all ages and conditions, but his especial study was old age. In his interpretation of the Scriptures he did not seek to give dignity by a factitious magnificence, or by elevating personages above their social rank, but by inspiring respect for them, and interest in them, as they were. At the same time his artist-faculty of idealisation acted in its own way by giving sublimity. Of the great artists Rembrandt is not the most perfect, but he is the most interesting, and his work is full of variety, both in subject and in technical methods. He was a great draughtsman, in his own way, and often a fine colourist as well as a great executive virtuoso both in painting and etching. Rembrandt had much personal influence as a teacher, and many of his pupils became known. His life seems to have been absorbed in work, and he avoided fashionable society, keeping to the burghers and artists.

See the elaborate French Life by his countryman Vosmaer (Paris, 1877), the interesting study by Émile Michel (trans. ed. by Wedmore, 1893), and the monograph on the etchings by the present writer (in the *Portfolio* of 1894). The first catalogue of the etchings of Rembrandt is the incomplete one by Gersaint, published after his death in 1751. Peter Yver of Amsterdam supplemented this, and Daulby of Liverpool published a translation in 1796. Adam Bartsch followed at Vienna in 1797. De Claussin published in 1824 an edition of preceding catalogues. Wilson (Lond. 1836) issued a new catalogue with original observations. That by Charles Blanc, in two vols. (Paris, n.d.), includes both pictures and etchings, that by Mr Middleton (Lond. 1878) gives the etchings only, and a catalogue privately printed for the Burlington Club in 1877 gave the etchings in chronological order. Vosmaer gave catalogues at the end of his biography, both chronological and classified. Mr F. S. Haden's monograph on the etchings (Lond. 1879) proves that some of the plates attributed to Rembrandt were executed by other hands, probably by pupils. The best existing catalogues of Rembrandt's works give about 500 pictures, 500 drawings and studies, and 353 etchings. The bent of his mind may be judged of by the choice of subject. Out of the general total of about 1450 works 136 are from the Old Testament, 255 from the New, 22 from classical mythology, and only 12 from history. There are about 440 portraits and 100 landscapes, besides some sketches of animals and many studies not classed. With the single exception of the Bible, Rembrandt got little from books, and his house, so rich in works of graphic art, contained barely twenty volumes.

Remijia, a genus of Cinchonaceæ (see CINCHONA), valuable as a source of Quinine (q.v.). There are no less than thirteen species found in Brazil. The name comes from that of the Brazilian physician Remijo.

Remington, PHILO, inventor, was born at Litchfield in New York on 31st October 1816. He entered the small-arms factory of his father, and for twenty-five years superintended the mechanical department. The perfecting of the Remington breech-loading rifles and of the Remington typewriter was largely due to his inventive skill. He retired in 1886, and died on 4th April 1889.

Remiremont, a town of France (dept. Vosges), stands on the Moselle, 17 miles by rail SE. of Epinal. The remains of an abbey, founded in 620, are the finest building in the town. The abbess was a princess of the empire down to 1566; the nunnery was suppressed at the Revolution. Muslin, cotton, leather factories, and sawmills exist here. Pop. 8447.

Remittent Fever is one of the varieties of fever arising from malaria or marsh-poison—one being Intermittent Fever, or Ague (q.v.). In its milder forms it scarcely differs from severe intermittent fever; while in its more serious form it may approximate closely to yellow fever. As the nature of the poison on which it depends is sufficiently noticed in the article MALARIA, we shall at once proceed to describe the most characteristic symptoms. The attack may be either sudden or preceded by languor, chilliness, and a general feeling of *malaise*. Then comes a cold stage, usually of short duration. This is followed by a hot stage, in which the symptoms are commonly far more intense than those exhibited in the worst forms of ague. Giddiness proceeding to delirium is not uncommon, and is a bad symptom; while in other cases drowsiness or lethargy is one of the most marked symptoms. There is often great tenderness or pain in the region of the stomach, and vomiting—the vomited matter frequently containing bile or blood. A remission of these symptoms occurs, in mild cases, in six or seven hours; but in severe cases the paroxysm may continue for twenty-four hours or longer. The remission is sometimes, but not always, accompanied with sweating. The duration of the remission is as varied as that of the paroxysm, varying from two or three to thirty hours, or even longer. The fever then returns with increased severity, and without any cold stage; and then the paroxysms and remissions proceed, most commonly according to no recognisable law, till the case terminates either fatally or in convalescence. In favourable cases convalescence is usually established in about a week. The severer forms of this fever are often accompanied with more or less jaundice, and hence the disease has received the name of bilious remittent fever. It is also known as jungle-fever, lake-fever (from its prevalence on the border of the great American lakes); and the African, Bengal, Levant, Walcheren, and other similar local fevers are merely synonyms of this disease. In England the disease is very rare; and when it occurs it is usually mild. The disease is most severe in southern Asia, western Africa, Central America, and the West India Islands.

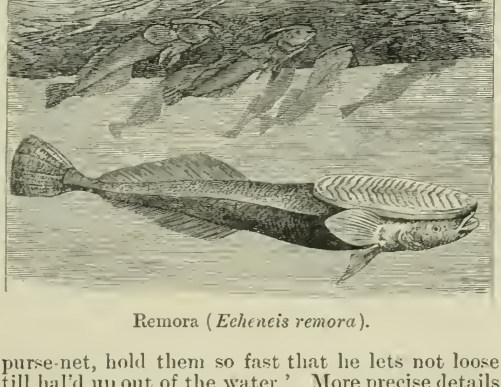
The first object of treatment is to reduce the circulation during the hot stage. This is done by a dose of five grains each of calomel and James's powder, and, after an interval of three or four hours, by a sharp cathartic—as, for instance, the ordinary black draught. On the morning of the following day the remission will probably be more complete, when quinine should be freely and repeatedly administered. A mixture of antimonial

wine with acetate of potash should also be given every two or three hours, so as to increase the action of the skin and kidneys. The patient must be carefully watched during the period of convalescence. A timely removal from all malarious influence, by a change of climate or a sea-voyage, is of the highest importance.

Remonstrance, The, a detailed statement of all the king's illegal and oppressive acts, and a vindication of the rights of parliament, laid before the House of Commons by Pym, and carried by 159 votes to 148, after a stormy debate lasting from noon till after midnight, November 22 and 23, 1641. On the question as to its being printed the debate began anew with such extraordinary exasperation that an actual conflict on the floor of the House was saved only by the calmness and tact of Hampden. On a division a majority of 23 left the publication free and restrained the printing only until further order. The adoption of the Remonstrance was felt on both sides to be a crisis in the struggle between Charles I. and the parliament. It kindled afresh the enthusiasm of the country, and hurried the king into more violent and fatal measures. 'The turning-point of freedom or despotism,' says Forster, 'for two more centuries in England was probably passed that night.'

Remonstrants. See Arminius.

Rem'ora, or Sucking-fish (*Echeneis*), a genus of fishes sometimes classed not far from mackerels among the Acanthopterous Teleosteans, or referred to a special sub-order Discocephali. The great peculiarity is the suctorial disc on the dorsal surface of the head. It is formed from a modification of the first dorsal fin, whose spines have become cleft. The sucking-fishes fix themselves very firmly to sharks, sword-fish, turtles, and even to ships. So firmly do they adhere that they are sometimes used in fishing. A line is fixed to the tail; the fish is set free; it discovers a turtle or fish and fastens itself. The fishermen dive after the line if the remora has fastened on to a turtle, or may in other cases simply haul it up. Columbus, or one of his companions, described how the 'Guaican' shoots 'like an Arrow out of a Bowe towards the other fish, and then, gathering the bag on his head like a



Remora (*Echeneis remora*).

purse-net, hold them so fast that he lets not loose till hal'd up out of the water.' More precise details have been furnished by other travellers. Several species of Echeneis or remora are known from Zanzibar, Cuba, New Guinea, &c. The remora of the Mediterranean was well known to the ancients, and was credited with many feats, such as that of detaining Antony's ship from the battle of Actium. The fish is palatable, and is sometimes eaten after its day's work of fishing.

Removal of Goods. See Landlord and Tenant.

Remscheid, a town of Rhenish Prussia, 6 miles S. of Elberfeld-Barmen, carries on extensive manufactures of iron wares, cutlery, &c. Pop. (1871) 22,017; (1880) 30,029; (1890) 40,500.

Rémusat, (Jean Pierre) Abel, Chinese scholar, was born at Paris, 5th September 1788, studied medicine, and took his diploma in 1813; but as early as 1811 he had published an essay on Chinese literature. In 1813 he was compelled to serve as hospital surgeon, but in 1814 he was made professor of Chinese in the Collége de France. Of the numerous works that he wrote subsequent to this period we may mention *Recherches sur les Langues Tartares* (1820), a work in some sort preparatory to his great *Éléments de la Grammaire Chinoise* (1822). He wrote also on the origin of Chinese writing (1827), on Chinese medicine, on the topography and history of the Chinese empire, and *Mélanges* (published in 1843). Rémusat was the first to make known in Europe the life and opinions of Laou-Tsze. In 1818 Rémusat became one of the editors of the *Journal des Savants;* in 1822 he founded the Société Asiatique of Paris; and in 1824 he was appointed curator of the Oriental Department in the Bibliothèque Royale. He died of cholera at Paris, 3d June 1832, at the early age of forty-four.

Rémusat, Charles (François Marie), Comte de, a French politician and *littérateur*, born at Paris, 14th March 1797, the son of Augustin Laurent, Comte de Rémusat (1762–1823), who was successively chamberlain to Napoleon and a prefect under the Restoration. His mother (*née* Claire Elizabeth Jeanne Gravier de Vergennes) was born in 1780, married in 1796, became *dame du palais* to Josephine, and died in 1821. Young Rémusat early developed Liberal ideas, and took eagerly to journalism. He signed the journalists' famous protest against the Ordinances of Polignac which brought about the July revolution, and was in October elected deputy for Toulouse. He now allied himself with the Doctrinaire party, and in 1836 became under-secretary of state for the interior. In 1840, when the government passed into the hands of Thiers, Rémusat was made minister of the Interior, but soon resigned the office. He was exiled after the *coup d'état* of Louis Napoleon, and henceforward devoted himself to literary and philosophical studies, till, in August 1871, M. Thiers called him to hold the portfolio of Foreign Affairs, which he retained until 1873. He died June 6, 1875. Rémusat was long a well-known contributor to the *Revue des Deux Mondes.*

Among his writings are his *Essais de Philosophie* (1842); *Abélard* (1845); *L'Angleterre au XVIII^e^ Siècle* (1856); studies on *St Anselm* (1853), *Bacon* (1857), *Channing* (1857), *John Wesley* (1870), *Lord Herbert of Cherbury* (1874); *Histoire de la Philosophie en Angleterre de Bacon à Locke* (1875); and posthumously two philosophical dramas, *Abélard* and *La Saint Barthélemy* (1878), and *Correspondance pendant les premières années de la Restauration* (6 vols. 1883–87).

His mother's *Mémoires* (3 vols. 1879–80) and *Lettres* (2 vols. 1881), both of which have been translated into English, proved to be of the greatest interest, and threw a flood of light on the strange society of the First Empire and the character of Napoleon.

Remy, St (Lat. *Remigius*). See Rheims.

Renaissance is a comprehensive name for the great intellectual movement which marks the transition from the middle ages to the modern world; a movement including a very marked change in attitude of mind and ideal of life, as well as in philosophy, art, literary criticism, political and religious thought. Substantially a revolt against the barrenness and dogmatism of Mediævalism, the new spirit claimed the entire liberation of reason, and, passionately recognising and studying

the rich humanity of Greece and Rome, aimed at a complete rehabilitation of the human spirit with all the free activities and arts and graces which invested the classical age. It was an escape —at first hesitating, then triumphant—from a life regulated and confined on all sides by ecclesiastical tradition and intellectual tyranny into joyous freedom and unfettered spontaneity. Zeal for the *Litteræ Humaniores* brought forth a new ideal of culture, and the new view of life for which the name of Humanism (q.v.) is used. Renaissance, re-birth, was originally used as synonymous with the Revival of Letters, the revived study in a new spirit of the classical languages and classical literatures of Greece and Rome in all their depth and breadth, interpreted in their own spirit, and divested of the narrow traditional limitations. Greek in especial was practically a new discovery, and a vastly important one; but the knowledge of the classics was only one side of the movement which permeated and transformed philosophy, science, art, and religion. The new spirit powerfully aided in weakening the power of the papacy, in the establishment of Protestantism and the right of free inquiry. Under its impulse astronomy was eventually reformed by Copernicus and Galileo, and science started on its modern unfettered career; by it, too, feudalism was abolished, and the demand for political liberty began to be raised. Reverence for the Holy Roman Empire and for its ancient rival the papacy was alike decaying; a new sense of nationality was springing up, and national languages began to flourish. To the same general impulse, as causes or effects, belonged also the invention of printing and multiplication of books, new methods of paper-making, the use of the mariner's compass, the discovery of America, and the exploration of the Indian Sea. The fall of the Eastern Empire in 1453 sent swarms of Greek scholars to promote the revival of scholarship already in progress in western Europe. From the nature of the case, it is impossible to fix a definite date for the beginning of the Renaissance; long before the close of the dark ages there were isolated scholars and thinkers who anticipated the new light. In its main elements, however, the movement originated in Italy towards the end of the 14th century, and, attaining its full development there in the earlier half of the 16th, the Renaissance communicated itself throughout the whole of the rest of Europe; France, Germany, England, and other countries participating later in the movement, which in each of them took a somewhat different shape. But Italy was specially the nursing-mother of the Renaissance.

For the first herald of the Renaissance we may go as far back as Dante (1265–1321), who, with all his mediævalism of conception, yet by the pristine energy and fullness of his poetry was no unworthy follower of his chosen master, Virgil. The first positive impulse, however, in that direction was imparted by Petrarch (1304–74). Besides suggesting in his Italian *Rime* the old Roman grace, he awoke enthusiasm for the classics by his Latin epic *Africa* and numerous epistles and dissertations. In his old age he tried to imbibe a little Greek at the extremely sorry sources within his reach, and on receiving Homer from Constantinople urged Boccaccio to translate the supreme poet into Latin. Boccaccio did not rest till he had piously, though very imperfectly, rendered into Latin both the *Iliad* and *Odyssey*. A secretary of Petrarch, Giovanni Malpaghino, commonly called da Ravenna, was the most accomplished Latinist of his day, and, wandering as he did all over Italy, communicated the new impulse to distinguished pupils, Barbaro, Strozzi, Poggio, Bruni, who in their turn propagated it anew from Venice, Rome, Mantua, and elsewhere. Luigi Marsigli's house became a private academy of the new doctrine, a resort of all the promising neophytes of Florence. Caluccio de Salutato, who translated Dante into Latin, having been made chancellor of Florence in 1375, introduced into public documents the stately sonorous periods of the classic style, and so rendered it imperative on all princes and popes of the next age to have trained stylists as their secretaries. A like classic transformation was effected in epistolary correspondence by Gasparino da Barzizza, who made a special study of Cicero's letters. The glory of having been the first Florentine to visit Byzantium for the sake of learning the sacred Greek belongs to Giacomo da Scaparia. To Salutato and Palla degli Strozzi is due the foundation of a Greek chair at Florence; and in 1396 Manuel Chrysoloras, a genuine Greek in the flesh, began his instructions from the Greek chair. Chrysoloras planted schools also at Rome, Padua, Milan, and Venice. In the earlier period of the Renaissance Florence leads the van. The president of the republic, Cosimo de' Medici, himself a scholar, theologian, philosopher, musician, financier, a connoisseur in painting, sculpture, and architecture, figures as the magnificent Mæcenas of the new learning, founding the Platonic academy, and opening his hospitable house to all the wits at home and all the distinguished visitors attracted thither. The son of his physician, Marsilio Ficino (q.v.), Cosimo educated for the express purpose of interpreting Plato. Strozzi, perhaps the richest after Cosimo of the merchant-princes of Florence, sent to Greece for countless volumes of MSS., and constantly kept copyists employed. Niccolo de' Niccoli spent his whole fortune in buying MSS. or procuring copies. Poggio Bracciolini, one of the most eminent of the scholars of his time, rescued Quintilian from a 'foul prison' and transcribed him, and copied with his own hand MSS. of Lucretius and Columella, while he also unearthed Italicus, Manilius, and Vitruvius. Though for fifty years chancellor in the Roman Curia, he directed the most poignant satires against the church. Vespasino da Bisticci (1421–98) was perhaps the last of the mediæval scribes, and the first of modern booksellers; he was agent of Cosimo, Nicholas V., and Frederick of Urbino, supplier of MSS. to Hungary, Portugal, Germany, and England, and the largest employer of copyists in Europe, whom, too, he personally superintended.

The second period in the history of the Renaissance is distinguished by indiscriminate avidity for everything classic. As its most representative scholar may be cited Francesco Filelpho (1398–1481). Having studied rhetoric and Latin at Padua, he learned Greek at Constantinople, became professor at Venice, Bologna, and Florence, and gained the admiration of all Italy for erudition. In the third period of the Renaissance the leading figures are Lorenzo de' Medici and Politian at Florence, Boiardo at Ferrara, and Sannazaro at Naples. President of Florence from 1469, and himself of the most versatile talent, Lorenzo de' Medici was, like his grandfather Cosimo, his son Giovanni (Leo X.), and his nephew Giulio (Clement VII.), a munificent patron of learning. By the consent of all, the most consummate of the humanists is Politian, whose *Manto*, *Ambra*, and *Nutritia* display almost as spontaneous a command of the classic languages as do his *Orfeo*, *Stanze*, and *Rime* of his native Italian. Towards the end of the 15th century mere erudition began to sink in credit, and the accomplished personages who adorn the fourth period are of a somewhat more independent type —the historians, Guicciardini and Machiavelli,

the handsome Bembo, the splendid Alberti, Castiglione, the author of *Il Cortegiano*, and Ariosto, author of *Orlando Furioso*, the *Cinque Canti*, and the polished cynical *Satires*.

Some of the faults of the Renaissance clung to it in all its periods. At one time pedantry threatened to check originality and spontaneity; the worst ancient works were prized more than the best written in any new European tongue. Petrarch valued himself mainly for his Latin works, and thought lightly of his Italian poems. The tendency was established to regard the classics as the one standard of learning and the one instrument of education. A worse fault was it that the revolt against mediæval religious tradition was accompanied to a very large extent by absolute and anti-Christian immorality and license. Literary and artistic refinement placed no check on brutal lusts and savage passions; though in a few men of high character, Michael Angelo, Raphael, Pico della Mirandola, Ficino, and others, in whom Humanism did not extinguish the principles of Christianity and morals, a singularly noble and complete humanity was displayed. The culmination of the Renaissance in Italy may be regarded as having fallen within the half century 1456–1500; and its close for the land of its birth may be fixed at the sack of Rome in 1527 by the Constable de Bourbon, followed by the transference of Humanism in its later developments to France, England, and the rest of Europe.

In Germany the change was as marked as in Italy, but the Humanism of Germany and the Low Countries was very different in spirit from that of Italy. Not less tinged by a revived love for ancient learning, it was never divorced from morality nor hostile to Christianity; and its most important direct outcome was the Reformation. Biblical and Oriental studies were strenuously cultivated. Amongst the noted leaders were Erasmus, Melanchthon, Reuchlin, and Von Hutten. In the Netherlands and Flanders the new school of painting was a notable development. In France the movement had rich results in art and letters. Villon, Marot, Ronsard, but above all Rabelais are types of the French Renaissance in pure literature; while within the sphere of scholarship and religious reform we have here the names of the Scaligers, Dolet, Muretus, Cujacius, Salmasius, Casaubon, Beza, Calvin.

In England Wyclif and Chaucer may be regarded as the forerunners of the Reformation and the Renaissance; but the main streams of both these movements reached England contemporaneously. In scholarship the great names are Grocyn, Linacre, Colet, Ascham, and More; but the fullest English outcome of the Renaissance was the glorious Elizabethan literature, with Spenser and Shakespeare, and in philosophy Bacon, as its most noted representatives.

RENAISSANCE, in Architecture, the style which succeeded the Gothic, and preceded the rigid copyism of the classic revival in the first half of the 19th century. Under the heading ITALIAN ARCHITECTURE we have traced the rise and progress of the Renaissance in the country of its birth. The spread of classical literature during the 15th and 16th centuries created a taste for classic architecture in every country in Europe. France, from her proximity and constant intercourse with Italy, was the first to introduce the new style north of the Alps. Francis I. invited Italian artists to his court during the first half of the 16th century. The most distinguished of these were Leonardo da Vinci, Benvenuto Cellini, Primaticcio, and Serlio. These artists introduced Italian details, and native architects applied them to the old forms to which they were accustomed, and which suited the purposes of their buildings, and thus originated a style similar to, though diverse from, that of Italy.

The Italian buildings, besides many palaces and domestic structures, comprised a large number of churches, St Peter's being the great model. In France (as in the other countries north of the Alps) the stock of churches was greater than was required. The grand domestic buildings of Florence and Rome were constructed for defence externally, and were founded in design on the old mediæval castles, which the nobles occupied within the cities. The domestic architecture of France is rather taken from the luxurious residences of the monks, and the pleasant open villas in the country; so that, although very graceful in outline and in detail, its buildings want the force and grandeur of the Italian palaces.

In the French Renaissance so much are the old Gothic forms and outline preserved that the buildings of Francis I. might at a short distance be mistaken for Gothic designs, although on nearer approach all the details are found to be imitated from the classic. Such are the palaces of Chambord (q.v.)

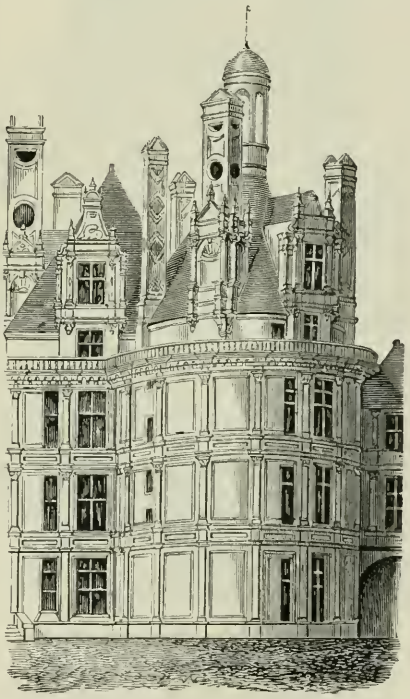


Fig. 1.—Château of Chambord.

and Chenonceaux (q.v.) on the Loire, Fontainebleau, and many others. The churches of this period are the same in their principles of design. Gothic forms and construction are everywhere preserved, while the details are as nearly classic as the designers could make them. St Eustache, in Paris, is one of the finest examples of this transitional style.

From the middle of the 16th to the middle of the 17th century a style prevailed which may be said to exhibit all the varieties of the Renaissance. This style, usually known as that of the time of Henry IV., may be distinguished by the constant use of pilasters, broken entablatures, curved and contorted cornices, architraves, &c., all applied so as to conceal rather than to mark and dignify the real uses of the features of the buildings. The Tuileries, wrecked by the Commune, showed all these defects.

Many of the features of this period are imitated in the so-called 'Queen Anne style' of the present time (see below). From this debased style architecture gradually recovered, and during the 18th century a style more becoming the dignity and importance of the *Grand Monarque* was introduced. The classic element now began to prevail, to the entire exclusion of all trace of the old Gothic forms. Many very large palaces are built in this style; but, although grand from their size, and striking from their richness and luxuriance, they are frequently tame and uninteresting as works of art. The palace of Versailles (q.v.) is the most

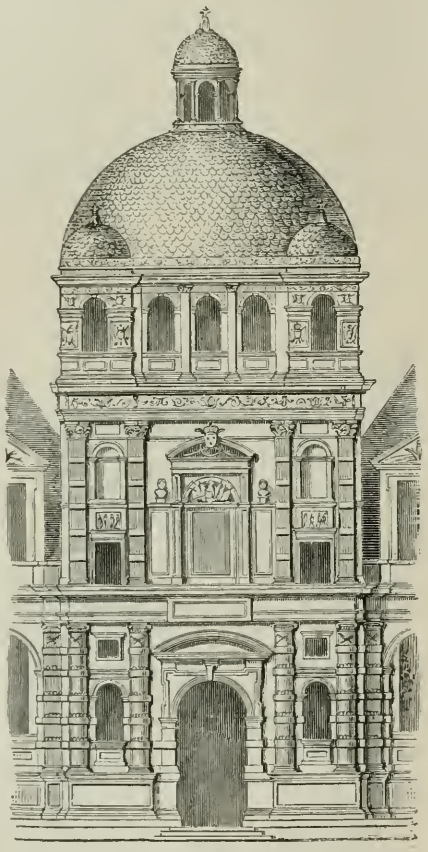

Fig. 2.—Central Pavilion of the Tuileries; as designed by De Lorme.

prominent example. The two Mansards, one of whom designed Versailles, had great opportunities during this extravagant epoch. Their invention of giving a row of separate houses the appearance of one palace, which has ever since saved architects a world of trouble, was one of the most fatal blows which true street-architecture could have received. The east front of the Louvre, designed by Perrault, is one of the best examples of the style of the age. Many elegant private hôtels and houses in Paris were erected at this period. A peculiarity of the style of Louis XIV. is the ornament then introduced, called Rococo (q.v.).

The classic Renaissance was completed in the beginning of the 19th century by the literal copying of ancient buildings. Hitherto, architects had attempted to apply classic architecture to the requirements of modern times; now they tried to make modern wants conform to ancient architecture. In the church of the Madeleine, Paris, for instance, a pure peripteral temple is taken as the object to be reproduced, and the architect has then to see how he can arrange a Christian church inside it! Many buildings erected during the time of the Empire are no doubt very impressive, with noble porticoes, and broad blank walls; but they are in many respects mere shams, attempts to make the religious buildings of the Greeks and Romans serve for the conveniences and requirements of the 19th century. This has been found an impossibility—people have rebelled against houses where the window-light had to be sacrificed to the reproduction of an ancient portico, and in which the height of the stories, the arrangement of the doors, windows, and, in fact, all the features were cramped, and many destroyed, in order to carry out an ancient design. The result has been that this cold and servile copyism is now entirely abandoned. The French are working out a free kind of Renaissance of their own, which promises well for the future, and is, at the present moment, as the streets of Paris testify, the liveliest and most appropriate style in use for modern street-architecture.

In Spain the Renaissance style early took root, and, from the richness of that country at the time, many fine buildings were erected; but it soon yielded to the cold and heavy 'Greco-Romano' style, and that was followed by extravagances of style and ornament more absurd than any of the reign of Louis XIV. The later Renaissance of Spain was much influenced by the remnants of Saracenic art which abound in that country.

In England, as in the other countries of Europe, classic art accompanied the classic literature of the period; but, the fountain-head being at a distance, it was long before the native Gothic style gave place to the classic Renaissance. It was more than a century after the foundation of St Peter's that Henry VIII. brought over two foreign artists—John of Padua and Havenius of Cleves—to introduce the new style. Of their works we have many early examples at Cambridge and Oxford, in the later half of the 16th century. Longleat, Holmby, Wallaton, and many other country mansions, built towards the end of the 16th century, are fine examples of how the new style was gradually adopted. The course of the Renaissance in England was similar to its progress in France; it was even slower. Little classical feeling prevailed till about 1620. The general expression of all the buildings before that date is almost entirely Gothic, although an attempt is made to engraft upon them classical details. The pointed gables, mullioned windows, oriels and dormers, and the picturesque outlines of the old style are all retained long after the introduction of quasi-classic profiles to the mouldings. This style, which prevailed during the later half of the 16th century, is called Elizabethan (q.v.), and corresponds to the somewhat earlier style in France of the time of Francis I. This was followed in the reign of James I. by a similar but more extravagant style called Jacobean, of which Heriot's Hospital at Edinburgh is a good example; the fantastic ornaments, broken entablatures, &c., over the windows, being characteristic of this style, as they were of that of Henry IV. in France.

The first architect who introduced real Italian feeling into the Renaissance of England was Inigo Jones. After studying abroad he was appointed superintendent of royal buildings under James I., for whom he designed a magnificent palace at Whitehall. Of this only one small portion was executed (1619–21), which still exists under the name of the Banqueting House, and is a good example of the Italian style. Jones also erected several elegant mansions in this style, which then

became more generally adopted. In the later half of the 17th century a splendid opportunity occurred for the employment of the Renaissance style after the great fire of London. Sir Christopher Wren rebuilt an immense number of churches in that style, of which St Paul's (see LONDON) was the most important. The spire of Bow Church and the interior of St Stephen's, Walbrook, are also much admired.

During the 18th century classic feeling predominated, and gradually extended to all classes of buildings. In the early part of the century Vanbrugh built the grand but ponderous palaces of Blenheim and Castle Howard, which have a character and originality of their own. To these

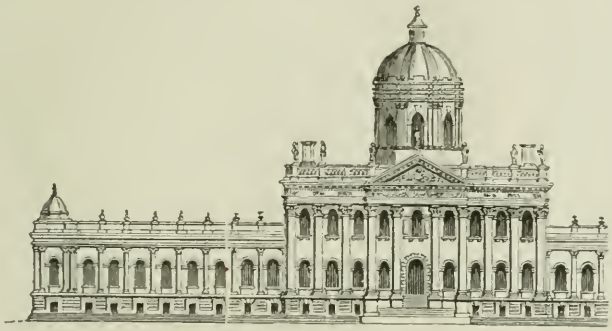

Fig. 3.—Park Front of Castle Howard.

succeeded a vast number of noblemen's mansions, designed by Campbell, Kent, the Adamses, and others. Many of these, like the contemporaneous buildings of France, are of great size and magnificence; but they are usually tame and cold in design, and a sameness pervades them all. They generally consist of a rustic basement-story, with a portico over the centre, and an equal number of windows on either side. The portico is considered essential, and, although it is perfectly useless, the light and convenience of the house are invariably sacrificed for it.

The further study of the buildings of Greece and

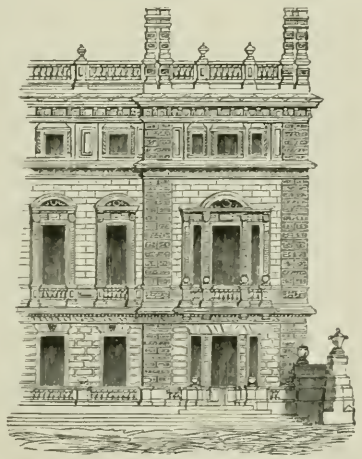

Fig. 4.—Portion of Façade of Bridgewater House.

Rome led, in the beginning of the 19th century, to the fashion of reproducing them more literally. All important public buildings were now required to be absolute copies of ancient buildings, or parts of them, or to look like such, and then the architect had to work out the accommodation as best he might. St Pancras' Church in London is a good example. It is made up of portions from nearly every temple in Greece! Many really successful buildings, such as St George's Hall, Liverpool, the High School and Royal Institution in Edinburgh, have been erected in this style; but they owe their effect not to their being designs well adapted to their requirements, but to the fact that they are copies from the finest buildings of antiquity. We have thus two different styles included under the head of Renaissance—viz. one in which the classic elements are subordinated to the Gothic dispositions, and which is now generally understood by the expression 'Renaissance;' and the other that in which the classic elements distinctly predominate, and which is commonly known as 'Classic.'

Sir Charles Barry was the first to break away from this thraldom, and to return to the true system of designing buildings—namely, by so arranging their general features as not only to express the purposes they are intended to serve, but in so doing to form the decorative as well as the useful elements of the edifice. The Travellers' Club-house and Bridgewater House in London are admirable specimens of his design. There are no superfluous porticoes or obstructive pediments, but a pleasing and reasonable design is produced by simply grouping the windows, and crowning the building with an appropriate cornice.

As already noticed, a similar style of domestic architecture is now being worked out in France; but both there and in England there was a reaction against everything classic, and a revival of mediæval architecture superseded that of classic, especially in ecclesiastical buildings. The most magnificent examples of this style are the Palace or Houses of Parliament at Westminster, and the new Law Courts.

The so-called Queen Anne style, common in recent years, is supposed to be founded on the class of design prevalent at the beginning of the 18th century. The buildings erected at that period were of a very plain and simple order, with classic cornices and details, and frequently with large windows, sometimes divided by mullions. There is occasionally a certain picturesqueness in the arrangements which has been made the most of in the modern revived style. The latter, although taking the name of Queen Anne, is far from adhering to the style of her reign, but is rather a free use of the elements of the early Renaissance or Elizabethan style. It thus combines much of the freedom of the late Gothic with classic detail, to which is added a copious use of features borrowed from the Renaissance of France and Germany. Many large structures have been erected in this style, such as the Royal Colonial Institute in London, and the new Law Courts at Birmingham. In these buildings the peculiar features of the style are visible—viz. large windows, divided by plain mullions, and a mixture of classic details and Gothic forms. The style adapts itself well to villas and smaller structures, in which the curved gablets of the dormers form prominent features.

In Germany, Russia, and every country of Europe the Renaissance came to prevail in a manner similar to that above described in other countries. The picturesque castle of Heidelberg is an early example, and the Zwinger and Japanese palace at Dresden are edifices of the beginning of the 18th century. In the domestic buildings of Nuremberg,

Dresden, and other towns of the north of Germany many instances occur of the picturesque application of classic detail to the old Gothic outlines. One of the most striking examples of the revival of classic art occurred in Bavaria during the first half of the 19th century, under the auspices of King Louis. He caused all the buildings he had seen and admired in his travels to be reproduced in Bavaria. Thus, the royal palace at Munich is the Pitti Palace of Florence on a small scale; St Mark's at Venice is imitated in the Byzantine Chapel Royal; and the Walhalla, on the banks of the Danube, is an exact copy (externally) of the Parthenon. The finest buildings of Munich are the Picture-gallery and Sculpture-gallery by Klenze, both well adapted to their purpose, and good adaptations of Italian and Grecian architecture. In Vienna and Berlin there are many examples of the revived Classic and Gothic styles, but the Germans have always understood the former better than the latter. The museums at Berlin, and many of the theatres of Germany, are good examples of classic buildings. The domestic architecture of Berlin is well worthy of notice, many of the dwelling-houses being quite equal in design to those of Paris. Of the other countries of Europe the only one which deserves remark for its Renaissance buildings is Russia. St Petersburg is of all the cities of Europe the one which best merits the title of a city of palaces. From the date at which the city was founded, these are necessarily all Renaissance in character. They are nearly all the works of German or Italian architects, and are unfortunately, for the most part, in the coldest and worst style. The ornaments of the palaces are chiefly pilasters running through two stories, with broken entablatures, &c., and ornaments of the flimsiest rococo. The New Museum, by Klenze, is, however, a marked exception. In America nearly all the new buildings of importance are carried out in the Renaissance style. Many of these are of great size and striking design. The town-hall of Boston may be referred to as one of the most imposing and effective. Another conspicuous example is the town-hall of Philadelphia (q.v.).

Along with architecture, during the period of the Renaissance Painting and Sculpture and all the other arts took their models from the classic remains which were so carefully sought for and studied. All ornamental work, such as carving, jewellery, and metal-work of every kind, followed in the same track. Mediæval niches and pinnacles gave place to the columns and entablatures of the classic styles, and the saints of the middle ages yielded to the gods and goddesses of ancient Rome.

F. Anderson (1896); Müntz, *Histoire de l'Art pendant la Renaissance* (1895); books on Renaissance Architecture in England by Gotch and Brown (1892 *et seq.*), and Blomfield (1897); and the articles REFORMATION, HUMANISM, PAINTING, ITALIAN ARCHITECTURE, and works there cited; as also those on ARIOSTO, BOCCACCIO, BRUNO, CAMPANELLA, ERASMUS, HUTTEN, MACHIAVELLI, MEDICI, PETRARCH, POLITIAN, RABELAIS, RAPHAEL, SAVONAROLA, &c.

Renaix, a town in the Belgian province of East Flanders, 25 miles by rail S. by W. of Ghent, carries on brewing and dyeing, and manufactures cotton and woollen fabrics, hats, and tobacco. Pop. 16,003.

Renan, ERNEST, was born at the little town of Trégnier, in the department of Côtes-du-Nord (Brittany), on the 27th February 1823. In his *Souvenirs d'Enfance* he has sought to mark the various influences that wrought in him during his childhood and early youth. He was a Breton Celt by his father's ancestry, a Gascon by his mother's; and all his critics have agreed with himself in recognising in his moral and mental habit the blended characteristics of this double descent. The centre of the life of Trégnier (originally a monastic village) is its minster, and to this atmosphere of the place Renan attributes in large measure his early bent to those studies which he unceasingly pursued for more than half a century. His father, who was a sailor, died while Ernest was still a child, leaving his widow in straitened circumstances, with the care of one daughter and two sons. To his mother and sister Renan owed a special debt which he has expressly acknowledged in his Memorials of his childhood. It further deepened the religious influences of his native village that he remained there till his sixteenth year as a pupil in its school. All his teachers were priests, and he himself describes them as men of primitive piety and simplicity, but wholly unacquainted with the movement of things outside their own parish. The education they gave was that which had been the tradition in the church for the preceding two centuries. 'They taught Latin in the old fashion, but above all they sought to turn out good men.'

The young Renan gave early promise of his future distinction, and in 1836 he was one of the lads chosen by the Abbé Dupanloup for a place in the Catholic seminary of St Nicolas du Chardonnet, in Paris, conducted by himself on methods entirely his own. The feelings of the boy on this change from the simple life of his Breton village were what might be those 'of a Mussulman fakir suddenly transported into a crowded *boulevard.*' The one aim of the Abbé Dupanloup in the training of the youth under his charge was to turn out priests with the accomplishments and temper of mind that would render them effective men of the world, able to serve the church in spheres where her interests could best be furthered. Dupanloup was respected and beloved by all his pupils; but, according to the most distinguished of them, whom he afterwards came to regard as a viper he had nursed in his bosom, his system was 'too little rational and too little scientific.'

The boy had from the first been destined for the church, and he proceeded regularly along the course it prescribed. After three years 'rhetoric' at St Nicolas du Chardonnet he was entered as a student of St Sulpice, the great seminary of the diocese of Paris. But before entering that seminary itself and beginning his theology proper he had to complete a two years' course of philosophy in a school at Issy, which formed a branch of the great seminary of St Sulpice. His next two years, therefore, were spent at Issy near Paris, in the study of such philosophical teachers as the church had stamped with its approval. Descartes adapted to Catholic orthodoxy, and the Scotch philosophy as taught by Reid, were the main subjects of study. At the conclusion of his course at Issy he was in all things, personal habits and temper of thought, a docile son of the church; though one of his teachers had already divined the essential tendency of his mind, and had plainly told him 'that he was not a Christian.' But it was the last stage of his novitiate that was to show what direction he was eventually to take. At St Sulpice his attention

was mainly turned to the study of Hebrew, and to this study, of his own accord, he added that of German. As the result of these combined studies (for Renan is careful to state that his questionings first came to him from historical and philological, and not from metaphysical considerations) the traditional construction of Christianity had become impossible for him. Quitting St Sulpice in 1845, he finally abandoned all thoughts of the church as a profession. At this crisis of spiritual struggle and general anxiety regarding his future, his sister Henrietta, to whom Renan has paid the highest tribute of brotherly affection, proved his invaluable friend and consoler. By her assistance and counsel he was placed in a position in which he could follow out that purpose which had been gradually shaping itself in his mind—a life of study untrammelled by creeds or formularies.

Thenceforward Renan's life was the uneventful one of the scholar. In 1848 he became *agrégé de philosophie*, and thus attained a distinct academic status. In 1850 he was appointed to a post in the department of manuscripts in the Bibliothèque Nationale in Paris. By the publication of successive *mémoires* his name became known in connection with Oriental studies, and in 1860 he was made one of a commission sent by the government of Louis Napoleon to study the remains of Phœnician civilisation. In 1861 he was chosen by the professors of the Collége de France to fill the vacant chair of Hebrew in that institution. As his views on traditional Christianity, however, were now notorious, the emperor, inspired by the clerical party, refused to ratify his appointment; and it was not till after the fall of the imperial government (November 1870) that he was actually established in possession of the chair. Travels in Italy, in Scandinavia, and the East, all in connection with special departments of research, have only been a component part of a career exclusively that of a student and writer of books. In 1878 he was chosen member of the French Academy. Renan married a niece of the famous painter Ary Scheffer.

Of the long series of Renan's works, which by their combined learning and literary power made him the first man of letters in Europe, we can here note only those which call for special mention in a summary account of his career. His work as an author began with a paper *Sur les Langues Sémitiques* (1847), afterwards developed into his *Histoire Générale des Langues Sémitiques* (1854). Checked and supplemented as it has been by subsequent scholars, this treatise is still regarded by specialists as having made an epoch in the history of Oriental studies. In his *Averroès et l'Averroïsme* (1852) he gave one proof among many others of his familiarity with the life and thought of the middle ages. In addition to these and other works dealing at length with special themes he wrote frequent essays, afterwards collected in his *Études d'Histoire Religieuse* (1856) and *Essais de Morale et de Critique* (1859), which arrested wide attention by their grace of style and originality of suggestion. His European reputation, however, dates only from the publication of the *Vie de Jésus* (1863), which one of his most discerning critics has described as 'one of the events of the century.' With the *Vie de Jésus* also began what its author regarded as the special work of his life, the *Histoire des Origines du Christianisme*. In Renan's conception the history of Christianity, in the true sense of the term, is possible only from the close of the 2d century after Christ. Previous to that period materials do not exist for an adequate narrative based on data that justify a dogmatic construction of the development of Christianity. The tracing of the Christian origins, therefore, must be a work essentially tentative, and one that, justifying conjecture, calls for the finest critical faculty in him who attempts it. It was with this conception of his task that Renan wrote the ten volumes, the labour of nearly thirty years, in which he has embodied his construction of the evolution of the Christian religion and theology. Among works of its kind it stands alone in literary value, though many of its large generalisations have not commended themselves to severer scholars. Of all the volumes that have appeared none excited the extraordinary interest of the first. In the *Vie de Jésus* the combined weakness and strength of Renan's method were exaggerated to caricature on a subject of supreme and universal interest, and one, moreover, which even from the boldest critics had hitherto exacted the tacit admission of its special place in the heart of humanity. Few readers, even in France, received it without large reserves on the score of good taste and right feeling, while in Britain its preciosity of sentiment and effeminate exquisiteness of manner jarred even on those who were at one with the writer in his general point of view. Of the volumes that followed the *Vie de Jésus*, that on St Paul and that entitled *Marc-Aurèle et la Fin du Monde Antique* are specially noteworthy, the one as assigning to the apostle a much inferior place in the history of the Christian church to that which Protestants at least have assigned him, the other for its brilliant delineation of the last stages in the life of paganism. In completion of the task he had set before him, Renan undertook what, as he has himself told us, should have been the natural beginning of his work, the history of the people of Israel. Three volumes of this history appeared between 1887 and 1891, and a fourth completes the author's plan.

Besides this main product of his genius and industry, Renan has from time to time published other volumes, in which he has expounded his views on the current questions of the day, as well as on the profounder questions of human life and destiny. In his *Questions Contemporaines* and his *La Réforme Intellectuelle et Morale* he has expressed his opinions on the tendencies of modern France, and indicated in what lies her hope for the future. As it is his deepest conviction that all dogmatism is out of place in the discussion of absolute questions, he has chosen the form of dialogue as the most fitting vehicle of his philosophical speculations. The *Dialogues Philosophiques* and the *Drames Philosophiques* are attempts in this kind to express the many-sided aspects in which life presents itself to different minds.

In 1883 Renan published *Souvenirs d'Enfance*, in which he has traced in his most delicate vein of humour and sentiment the early influences from persons and things amid which his childhood and youth were formed. As a supplement to this volume he also published *L'Avenir de Science* (1890), conceived and written in 1848, and expressing the views he then entertained regarding the tendencies of modern thought. Taken with the preface of 1890, this book throws a vivid light at once on the history of its author's opinions and on that double nature he inherited from his Celtic and Gascon ancestry. In his earlier work sentiment is often strained beyond the limit of virile feeling; his later writings often reveal the Gascon by unseasonable *persiflage* and epicurean suggestion. He died 2d October 1892, and was buried in the Panthéon.

Whatever may be the judgment of time on the intrinsic value of Renan's contribution to the sum of knowledge, he can never lose his place among the few great names in the history of letters. His only predecessor in universality of contemporary fame, in combined erudition and special endowment, is Erasmus, to whom, moreover, both in traits of talent and by the times of dissolution

in which they exercised their function as general critics and scholars, he suggests an interesting and evident parallel. Both gave their best years to the work of expounding Christianity; the one vies with the other in the long series of volumes which make the record of their life's labours; the scholarship of both was called in question by their contemporaries; both living in an age of religious revolution were accused by extremer men of undue concession to traditional opinion; and in the work of both it is the element of a many-sided and elusive personality that distinguishes it from the other work of their time.

Renan's *Histoire des Origines du Christianisme* consists of the following volumes: *Vie de Jésus* (1863), *Les Apôtres* (1866), *Saint Paul* (1867), *L'Antechrist* (1873), *Les Évangiles et la Seconde Génération Chrétienne* (1877), *L'Église Chrétienne* (1878), *Marc-Aurèle et la Fin du Monde Antique* (1880), *Index général* (1883); its great complement, *Histoire du Peuple d'Israël* (5 vols. 1887-1894). Other writings are: *Le Livre de Job* (1859); *Le Cantique des Cantiques* (1860); *L'Ecclésiaste* (1882); *Histoire Générale des Langues Sémitiques* (1854); *Mission de Phénicie* (1865-74); *Études d'Histoire Religieuse* (1856); *Nouvelles Études d'Histoire Religieuses* (1884); *Averroès et l'Averroïsme* (1852); *Essais de Morale et de Critique* (1859); *Mélange d'Histoire et de Voyages* (1878); *Questions Contemporaines* (1868); *La Réforme Intellectuelle et Morale* (1871); *De l'Origine du Langage* (1863); *Dialogues Philosophiques* (1876); *Drames Philosophiques*, including *Caliban, L'Eau de Jouvence, Le Prêtre de Nemi, L'Abbesse de Jouarre* (1888); *Souvenirs d'Enfance et de Jeunesse* (1883); *Discours et Conferences* (1887); *L'Avenir de Science* (1890); the Hibbert Lectures (1880) delivered in London, on *The Influence of the Institutions, Thought, and Culture of Rome on Christianity;* with Victor Leclercq, the *Histoire Littéraire de France au XIV^e Siècle;* and *Ma Sœur Henriette* (1895; trans. as *Brother and Sister*, 1896).

For critical estimates, see Sainte-Beuve, *Nouveaux Lundis* (tome ii.); Scherer, *Études sur la Littérature Contemporaine* (tome viii.); G. Monod, *Les Maîtres de l'Histoire* (1895). See also Grant Duff's *In Memoriam* (1893) and Mme. Darmesteter's Life of him (1897).

Rendsburg, a town of Sleswick-Holstein, stands on the Baltic Canal, 19 miles W. of Kiel, and has manufactures of cotton, machinery, and chemicals. Pop. 13,721.

René I., surnamed 'the Good,' titular king of Naples and Sicily, the son of Louis II., Duke of Anjou and Count of Provence, was born in 1409 at Angers. He failed in his efforts to make good his claim to the crown of Naples, gave his daughter in marriage to Henry VI. of England (1445), and ultimately devoted himself to Provençal poetry and agriculture at Aix in Provence, where he died regretted in 1480. See ANJOU.

Renegade is defined as one who renounces his religious faith and adopts another creed, more particularly one who renounces Christianity and becomes a Moslem; but in a wider sense the word is practically synonymous with traitor—that is, one who deserts to the enemies of his country. A few of the more notorious renegades of history may be named. Hippias, son of Pisistratus, fought with Sparta against his country Athens, and later joined the Persians. Onomacritus, the editor of Homer, another Athenian, added his persuasions to those of Hippias to induce Xerxes to invade Greece. Coriolanus led the Volscian armies against his native city Rome. Julian the Apostate was of course a renegade from Christianity. The Templars were accused, amongst other things, of being virtually renegades from their faith. The Algerine pirates surnamed Barbarossa (q.v.), who in the first half of the 16th century kept the Mediterranean coasts in a state of perpetual terror, were by birth Greek Christians of Mitylene. Henry of Navarre, fourth king of that name in France, renounced the Protestant creed after he ascended the throne. During the Thirty Years' War there was a prominent renegade leader on each side: Count Mansfeld (II.) deserted the emperor and the Catholic cause because the former treated him ill; Pappenheim, the commander of the celebrated dragoons and principal author of the sack of Magdeburg, went over from the Protestants to the Roman Catholics. Archibald Campbell, seventh earl of Argyll, was in 1619 declared a rebel for having entered the service of the king of Spain, a Roman Catholic prince at war with Britain. The 'pirate' Paul Jones, who during the war of American Independence ravaged the coasts of Scotland, was by birth a Scotsman. Mazeppa, the Cossack chief, fought against his sovereign at Pultowa in the army of Charles XII. of Sweden. The Duke of Riperda, who won his laurels in the service of Spain (18th century), though he was by birth a Dutchman, is said to have embraced Islam and led the armies of Morocco against the Spaniards. Omar Pasha, who distinguished himself against the Russians in the Crimean war, was born a Christian in Croatia, but fled to the Turks and embraced Islam. Another pasha, Emin, the hero of the Equatorial Province of Africa, is a German Jew, who has become a Mohammedan. The redoubtable Osman Digna, who has occasioned so much trouble as the Mahdi's lieutenant between Nile and Red Sea, is stated to be the son of French parents, his birthplace Rouen, his real name George Nisbet (Scotch?). In literature, besides plays and novels and poems dealing with personages already named, Massinger's *Renegado* and Byron's *Siege of Corinth* may be quoted as works in which renegades play important parts.

Renfrew, an ancient royal, parliamentary, and municipal burgh, the county town of Renfrewshire, stands on the south bank of the Clyde, 6 miles below Glasgow. Its charter of regality dates from 1396, but it was a burgh at least as early as the reign of David I. (1124-53). A knoll called Castlehill commemorates the site of Renfrew castle, the original seat of the royal house of Stewart. Anciently the chief port on the Clyde, it has still a small wharf, but the trade is unimportant. The principal industries are shipbuilding and weaving. It forms one of the Kilmarnock group of burghs, which return one member to parliament. Pop. (1841) 2013; (1881) 5503; (1891) 6777.

Renfrewshire, a county in the south-west of Scotland, bounded on the N. by the river and firth of Clyde, on the E. by Lanarkshire, and on the S. and W. by Ayrshire. Though only twenty-sixth of the Scottish counties in regard to size, it stands fifth in population. It is 31 miles long by 13 broad, and contains 254 sq. m. or 162,428 acres, of which 5642 are water and foreshore. Pop. (1801) 78,056; (1851) 161,091; (1881) 263,374; (1891) 290,798. The surface is irregular: besides the low lands fringing the Clyde, there are three principal valleys, those of the Gryfe, the Black Cart, and the White Cart, with upland pastures and ranges of hills, the highest point being the Hill of Stake (1711 feet) on the borders of Ayrshire.

Agriculture and the breeding of horses and cattle are carried on with success; dairy-farming is largely practised, owing to the proximity of large towns. Rather less than two-thirds of the whole extent is arable, mainly in pasture or grass crops. The minerals are coal, iron-stone, shale, and lime; copper occurs at Gourock and Lochwinnoch; and in the latter parish barytes is wrought. Besides mining and agriculture, numerous industries flourish in various parts of the county, the principal being the manufacture of thread, cotton, and chemicals, print and bleach works, shipbuilding, engineering, and sugar-refining. Renfrewshire is

well supplied with roads and railways, and has two considerable ports—Greenock and Port-Glasgow. It is divided for administrative purposes into two wards, Upper and Lower, with sheriff-substitutes at Paisley and Greenock. There are two parliamentary divisions, eastern and western, each returning one member. Till 1889 part of the southern suburbs of Glasgow was reckoned within the county. The chief towns, besides those mentioned, are Renfrew, the county town and only royal burgh, Pollokshaws, Johnstone, and Barrhead. Renfrewshire, or at least the western portion, was anciently called Strathgryfe, and it was the chief patrimony of the house of Stewart. In 1404, not long after the accession of that family to the crown, the title of Baron of Renfrew (still borne by the Prince of Wales) was conferred by Robert III. on his son James; and about the same time Renfrew was disjoined from the sheriffdom of Lanark and made a separate county.

See Crawford's *History of the Shire of Renfrew* (1716), and *Historical Collections of the County* (Paisley, 1885; not completed).

Reni, a town of Bessarabia, at the confluence of the Pruth and the Danube. Pop. 6000.

Reni, GUIDO. See GUIDO.

Renmark, an irrigation settlement on the Murray, 135 miles ENE. of Adelaide, engaged in grape-growing and other fruit-culture. Pop. 800.

Rennell, JAMES, geographer, was born near Chudleigh, in Devonshire, 3d December 1742, and served first in the navy and then as an officer of engineers in the East India Company's army, rising to be major. As surveyor-general of Bengal he prepared a *Chart of the Banks and Currents at the Lagulhas* (1778); and, having retired (1782), he wrote various works on India, including *Memoirs of a Map of Hindustan* (1783). In 1788 he was elected an F.R.S., in 1792 published a *Memoir of the Geography of Africa*, and in 1798 he aided Mungo Park in the arrangement of his travels, illustrating them by a map. Perhaps his most famous work was his *Geographical System of Herodotus Examined and Explained* (1800). In 1814 appeared his *Topography of the Plain of Troy*, and in 1816 *Illustrations of the Expedition of Cyrus*. After his death—at London on the 29th March 1830—there were published *An Investigation of the Atlantic Currents and those between the Atlantic and Indian Oceans* (1832) and *The Comparative Geography of Western Asia* (1831). See the monograph on him by Clements Markham (1895).

Rennes (the *Condate* of the Redones), the capital formerly of the province of Brittany, and now of the department of Ille-et-Vilaine, is situated at the confluence of those two rivers, 234 miles WSW. of Paris and 51 SSE. of St Malo. A seven days' fire in 1720 destroyed nearly 4000 houses, and the ancient walls have been superseded by pleasant promenades, so that the place wears a modern aspect. Four bridges connect the upper or new town and the lower or old town, and the most noteworthy of the public buildings are the cathedral, finished in 1844, and Italian in style; Notre Dame, with its dome surmounted by a huge image of the Virgin; the archbishop's palace (1672); the stately Palais de Justice (1618-54); the university buildings (1855), with a picture-gallery; the theatre (1835); the Hôtel de Ville, with a public library; and the Lycée. As the focus of main and branch lines of railway between Paris and the north-west of France, and commanding good river and canal navigation, Rennes is favourably situated for commerce; and, in addition to the transport of the abundant farm-produce of the neighbouring districts, it carries on a considerable trade in its own manufactures, which include sail-cloth, table-linen, &c. Pop. (1872) 48,658; (1891) 65,102. There is a standard history by Ducrest and Villeneuve.

Rennet (A.S. *rinnan, rennan,* 'to run') consists of the inner lining of the true stomach (see DIGESTION) of the sucking-calf. It contains a ferment which causes milk to clot (see MILK), called the milk-curdling-ferment. The rennet is used in the manufacture of cheese, and to a less extent in the preparation of curds and whey or junket. It is prepared by removing the stomach from the calf as soon as it has been killed, and separating off the lining membrane of the stomach. It is then salted and dried, and will keep for some time in that condition. When used, a small piece of the rennet, in which the ferment is still quite active, is softened in water and added to the milk which is to be curdled. For many years past the milk-curdling-ferment has been obtained from rennet in the form of an extract. It is soluble in salt and water, and is extracted from the fresh rennet of the calf, and kept from putrefying by the addition of alcohol. Extracts of rennet thus prepared are extensively used, and may be had at the druggists' stores.

Rennet. See APPLE.

Rennie, JOHN, civil engineer, was born at the farm of Phantassie, near East Linton, East Lothian, 7th June 1761. After being for some time a workman in the employment of Andrew Meikle, inventor of a Thrashing-mill (q.v.), he attended the lectures of Robison and Black at Edinburgh University. He visited (1784) the works of Messrs Boulton and Watt at Soho, near Birmingham, and was immediately taken into employment by that eminent firm. Here his mechanical genius soon displayed itself; and so highly did Watt esteem Rennie that he gave him, in 1789, the sole direction of the construction and fitting-up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the connecting wheel-work were so striking that Rennie at once rose into general notice, and abundance of mill-work now flowed in upon him. To this branch of engineering he added, about 1799, the construction of bridges, in which his pre-eminent talent and ingenuity displayed themselves. The chief of his bridges were those of Kelso (1803), Leeds, Musselburgh, Newton-Stewart, Boston, and New Galloway, with the Waterloo Bridge over the Thames, which was commenced in 1811, and finished in less than six years, at a cost of more than £1,050,000 (see Vol. II. pp. 437–8). Another of his works is Southwark Bridge; he also drew the plan for the London Bridge, which, however, was not commenced till after his death. He superintended the execution of the Grand Western Canal in Somerset, the Polbrook Canal in Cornwall, the canal between Arundel and Portsmouth, and, chief of all, the Kennet and Avon Canal between Newbury and Bath; he also drained a large tract of marsh land in the Lincoln Fens. (The Bell Rock lighthouse was almost wholly the work of Stevenson.) The London Docks, the East and West India Docks at Blackwall, the Hull Docks, the Prince's Dock at Liverpool, and those of Dublin, Greenock, and Leith were all designed by him, and wholly or partially executed under his superintendence. He also planned many improvements on harbours and on the dockyards of Portsmouth, Chatham, Sheerness, and Plymouth; executing at the last-mentioned port the most remarkable of all his naval works, the celebrated Breakwater (q.v.). He also made great improvements in the diving-bell. He died October 4, 1821, and was buried in St Paul's Cathedral. A striking characteristic of his works is the remarkable combination in them of beauty and durability; and though they were

frequently objected to on the ground of costliness, yet in the end their lasting qualities more than compensate for this. In person Rennie was of extraordinary stature and herculean strength. See Smiles's *Lives of the Engineers* (1874).

GEORGE RENNIE, civil engineer, and eldest son of the preceding, was born in Surrey, January 3, 1791, educated at Edinburgh University, and commenced the practical study of engineering, under his father, in London in 1811. In 1818 he was appointed superintendent of the machinery of the Mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death in 1821 Rennie entered into partnership with his younger brother, John (afterwards Sir John Rennie), as engineers and machinery constructors; and during the existence of the firm it carried on an immense business, including the execution of most of the works which had been planned by the elder Rennie and the completion of those which he had left unfinished. Their operations embraced the construction of bridges, harbours, docks, shipyard and dredging machinery, steam-factories, both in Great Britain and on the Continent, and marine engines for warships. They built ships both of wood and iron, drained large tracts of land in the midland counties of England, and superintended the construction of several continental railways. George Rennie died 30th March 1866.

His brother, SIR JOHN RENNIE, associated with him in business till 1845, was born August 30, 1794, entered his father's office previous to the construction of Southwark and Waterloo bridges, and was knighted on the completion of London Bridge, which he executed from his father's designs. He acted as engineer to the Admiralty for ten years, and, in conjunction with his brother, contributed to the introduction of the screw-propeller into the navy. He had a wide reputation for all subjects connected with hydraulic engineering, harbour-works, &c., and a list of his important engineering works will be found in his *Autobiography* (1875). He died September 3, 1874. He was author of *British and Foreign Harbours* (1854) and a monograph on Plymouth breakwater (1848).

Rent, in common speech, is money paid for the use of land or houses. In political economy it usually means money paid for the use of land; and it is in this reference that the theories and discussions of economists regarding rent have arisen. Economists have generally held it to be the great merit of Ricardo that he elucidated the true theory of rent. Anderson, Malthus, and West had indeed enunciated it before, but the classical statement of it (fully developed in his *Principles of Political Economy*, 1817) came from Ricardo. According to that theory the amount of rent paid represents the excess of the price of the produce of the land over the cost of production on that land. The cost of production includes the usual wages paid to the labourer, and the usual interest on the capital applied to the land, as well as remuneration of management. In other words, after the labourer has been paid the usual wages and the farmer has received the usual return for his capital and trouble from the produce of the land, the remainder is rent.

It will be seen therefore that the amount of the rent depends on the price obtained for the produce. Rising prices for agricultural produce mean rising rents. And in this, as in other departments, prices depend on the relation of demand to the supply. A rapidly increasing demand, or in other words, a rapidly growing population, and a supply that cannot nearly keep pace with it will lead to a great rise in prices. Such was the condition of England at the end of the 18th century and the beginning of the 19th, when a rapidly growing population had to depend almost solely on the home market. At such a time there was a great rise in rents. During the last generation the population has increased with a similar rapidity, yet, owing to free trade, the enormous development of the means of transport, and the opening up of vast agricultural lands in America and the colonies for the supply of the home market, prices have fallen and also rents. The demand has increased, but the supply has increased vastly more, and in spite of the growing population rents have fallen. The general truth however remains that rent depends on prices, and not prices on rent. Or, to use the Ricardian formula, which, however, is not a satisfactory expression of the fact, rent is not an element in the price of corn.

After having been much overrated as a discovery in political economy, the Ricardian theory of rent is now in many quarters unduly depreciated. It still remains generally valid under the conditions contemplated by its expounder. Those conditions are a system of land-holding by private owners who do not cultivate their land, capitalist farmers, and free labourers; the relation of the three classes to each other being determined by competition. In other words, the economists who have worked out the theory have had in view England, and other countries in so far as they are similarly circumstanced as England. But even in England there are many things which greatly modify the operation of the principle—the influence of custom, the natural conservatism of all classes, local attachment on the part of the farmer and labourer, &c. Very important also is the fact that many of the landlords have regard to social and political considerations, as well as to reasons of fairness and equity in fixing their rents. It must, moreover, be remembered that a disturbance in agricultural prices, such as that caused by the introduction into European markets of the enormous supplies from America, may have rendered the Ricardian theory ludicrously inapplicable to the rents actually paid, particularly under long leases. Under these circumstances rent was often paid not out of the surplus of the farmer's profits, but out of his capital. The Ricardian theory of rent therefore formulates a tendency which, even under the conditions contemplated, accords with facts only in a rough and general way.

When we consider economic history and the existing economic conditions of the world we may perceive how limited in scope the Ricardian theory of rent has been. In many countries custom has decided, and still decides, the rent paid for land. In very many countries it has not been either competition or custom that has regulated rent, but the owner has wrung from the cultivator all that he could. The only limit to the exactions of the owner has been his own pleasure or caprice or the endurance of the cultivator. In countries, however, where the state is the owner of the land rent may more correctly be regarded as a tax.

The rent paid for land occupied by towns and that paid for mines are in some important respects different from the rent of agricultural land. The rent paid for land in towns is much more directly influenced by the increase of population and the growth of prosperity. Inasmuch as the owner receives great advantages from such causes while contributing little or nothing, economists of standing maintain that such land should be under municipal ownership and control. The rent paid for mines is materially affected by the fact that mines become exhausted, while the agricultural properties of the soil are permanent in the main. As regards rent generally, it should be repeated that economic formulas are of comparatively little

value. The main thing is a thorough knowledge of the facts and conditions, which vary continually according to the time and country with which we are concerned. For other aspects of rent, see also LAND LAWS, LANDLORD AND TENANT.

Renton, a town of Dumbartonshire, on the right bank of the Leven, 2 miles N. by W. of Dumbarton. Founded in 1782, it has a Tuscan column (1774) to the memory of the novelist Smollett, who was born close by, and it carries on calico-printing, dyeing, and bleaching. Pop. (1831) 1860; (1881) 4319; (1891) 5256.

Renwick, JAMES, the last of the martyrs of the Covenant, was born at Moniaive, Dumfriesshire, 15th February 1662. He attended Edinburgh University with a view to the ministry, but was denied his degree, as he refused the oath of allegiance; and, after witnessing the deaths of Cargill and others of the martyrs, he resolved to embrace the cause for which they suffered. He was chosen by the 'Societies,' as the bands of men devoted to the Covenant were called, to proceed to Holland to complete his studies in 1682, was ordained at Groningen in 1683, and at once proceeded to Scotland, where his first sermon was preached at Darmead Muir in the same year. His life was now exposed to great hazards; he was obliged to move from place to place, and was often reduced to great destitution. In 1684 he published his *Apologetic Declaration*; for which he was outlawed. When James II. came to the throne in 1685 Renwick with 200 men went to Sanquhar, and published a declaration rejecting him. A reward of £100 was offered for his capture, he was hunted from place to place, and made many hairbreadth escapes, but was at last captured in Edinburgh. He was condemned and executed, 17th February 1688.

See Shield's *Life*, Renwick's *Choice Collection of Sermons, &c.* (1777), Simpson's *Life of Renwick* (1843).

Renwick, JAMES, LL.D., author and physicist, was born at Liverpool in 1790, and graduated at Columbia College, New York, in 1807. In 1820 he was made professor of Chemistry and Physics in that college, a position he held until 1853. In 1838 he was appointed by the United States government one of the commissioners to explore the line of the boundary between Maine and New Brunswick. He wrote, besides smaller text-books and translations, *Outlines of Natural Philosophy* (1822–23, the first extended work of its kind published in the United States), a *Treatise on the Steam-engine* (1830), several books on Mechanics, and Lives of De Witt Clinton, Jay and Hamilton, and others. He died 12th January 1863.—One of his sons, James, was architect of Grace Church and St Patrick's Cathedral, New York; other notable buildings from his designs are the Smithsonian Institution, Vassar College, &c.

Repairs is the legal as well as popular term to denote the repairs done to a house or tenement by a tenant or landlord during the currency of the lease. In England the burden of repairs is at common law thrown on the tenant, so that, unless the lease expressly say that the landlord is to do the repairs, the tenant will be bound to use the premises fairly and to keep house property wind and water tight. Usually the lease states who is to do the repairs. In the lease of farms the tenant is bound only to keep the house in repair, and not the out-buildings, though he is bound to keep the fences in repair. If the landlord is bound to do the repairs, and fails to do them, the tenant is not entitled to quit the premises on that account, though he will be entitled to sue the landlord for damage caused by the want of repairs. In Scotland the landlord is bound at common law to put the premises into tenantable repair at the commencement of the lease. The tenant is then bound to keep them in ordinary repair, but not to keep them in repair where some hurricane or extraordinary cause has done injury. In the United States the laws of the states vary; in several states it is enacted that a general promise to repair shall not bind the tenant to rebuild in case of destruction by fire.

Repeal. See O'CONNELL.

Repeating Rifle. See RIFLE.

Repentance, STOOL OF. See STOOL OF REPENTANCE.

Replevin, in English law, is a form of action by which goods which have been seized under a distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.

Reporting, an important branch of journalism, has already been incidentally discussed at NEWSPAPER; the methods by which, as a rule, it is practicable are dealt with at SHORTHAND. Here some account of the history of parliamentary reporting, in many respects the most important, is given.

Accounts of single speeches, and, at times, of entire debates in the English parliament, have come down to us from a very early period. The earlier volumes of the Journals of the House of Commons contain short notes of speeches; the later volumes record nothing but the votes and proceedings. Sir Symonds d'Ewes edited the *Journals of Queen Elizabeth's Parliaments;* and the Commons' Journals contain notes of speeches in the parliaments of James I. Rushworth, assistant-clerk in the Long Parliament, 1640, took down in a species of shorthand any speech of importance; and his account of *Remarkable Proceedings in Five Parliaments* forms one of the most valuable portions of his *Historical Collections.* During the reign of William III. a member now and then sent a copy of his speech to the newspapers, for printing which, however, they were sometimes called to account. In the reign of Queen Anne a monthly pamphlet, called the *Political State*, gave an outline of the debates in parliament. In the reign of George I. the *Historical Register*, published annually, professed to give reports of parliamentary speeches. The *Gentleman's Magazine* began a monthly publication of the debates, the number for August 1735 containing a report of the debate in the House of Lords on the previous 23d January. Cave, the publisher, continued the practice in succeeding numbers, and his systematic proceedings are thus described by Sir John Hawkins: 'Taking with him a friend or two, he found means to procure for them and himself admission into the gallery of the House of Commons, or to some concealed station in the other house, and there they privately took down notes of the several speeches, and the general tendency and substance of the arguments. Thus furnished, Cave and his associates would adjourn to a neighbouring tavern, and compare and adjust their notes; by means whereof, and the help of their memories, they became enabled to fix at least the substance of what they had lately heard and remarked. The reducing this crude matter into form was the work of a future day and an abler hand—Guthrie, the historian, whom Cave retained for the purpose.' There was, however, no publication of the debates during the sitting of the Houses; parliament was always prorogued before anything said in the course of the session was given in the magazine. At first the names of the speakers were cautiously indicated by the first and last

letter only, and in many cases the speaker's name was wholly omitted. Growing bolder by degrees, Cave printed the names at length. The House of Commons soon took the alarm. The publication of the debates of either House had been repeatedly declared to be a high breach of privilege—as by the Commons in 1588 and by the Lords in 1698. The Commons followed up several previous resolutions to the same effect by ordering, in 1728, 'that it is an indignity to, and a breach of, the privilege of this House for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper this House will proceed against the offenders with the utmost severity.' In 1738 Speaker Onslow called the attention of the House to the breach of its standing orders by Cave and others; and the result was another thundering resolution against the publication of debates 'either while parliament is sitting or during the recess,' and a threat to proceed against offenders with the 'utmost severity.' The reports, notwithstanding, still appeared, but under the disguise of 'Debates in the Senate of Lilliput,' in the *Gentleman's Magazine;* and 'Debates in the Political Club,' in the *London Magazine.* Dr Samuel Johnson was employed by Cave in the composition of his parliamentary debates, and the reports from 1740 to 1743 are held to have been entirely prepared by him, sometimes with the assistance of the above-mentioned Guthrie. When it was observed to Johnson that he dealt out reason and eloquence pretty equally to both parties, he remarked: 'I took care that the Whig dogs should not have the best of it.' It was not till thirty years later that the parliamentary debates descended from the magazines to the newspapers. The latter had, however, for some time resolved to report the debates, and they took advantage of the popular excitement arising out of the Luttrell-Wilkes election for Middlesex to try the right of the House to interdict the publication of its proceedings.

The ever-memorable contest between parliament and the press began at the close of the year 1770. The House of Commons followed up another solemn threat by prompt action; and the Lord Mayor of London and Alderman Oliver were sent to the Tower for refusing to arrest some printers of reports on the warrant of the Speaker, John Wilkes taking an active share in the controversy. The city of London loudly protested against the arbitrary proceedings of the House, and the whole country responded to the appeal. The power of parliament to imprison ceases at the end of the current session, and on the day of prorogation, July 23, the Lord Mayor and Alderman Oliver marched out of the Tower in triumph, and at night the city was illuminated. Next session the House of Commons tacitly acknowledged itself beaten. The printers defied the House, continued to publish their proceedings, and slept, notwithstanding, secure in their beds. In a short time the House of Lords also conceded the point, and the victory was complete; though it is still in the power of any member, who may call the Speaker's attention to the fact that 'strangers are present,' to exclude the public and the reporters from the House. This power has frequently been exercised during living memory, but on such occasions some one or more members who have dissented from this course have taken notes of the speeches, and have avowedly sent them to the newspapers.

The old machinery of newspaper reporting was susceptible of immense improvement. One of the Woodfalls (a brother of the Woodfall of Junius) had so retentive a memory that when editor of the *Morning Chronicle* he used to listen to a debate in the gallery, and write it out next day, the taking of notes being at that time forbidden. His successor established a corps of parliamentary reporters to attend the debates of both Houses every night in succession. He thus brought out the night's debate on the following morning, anticipating his rivals by ten or twelve hours. The improvement in the reports of the debates from the period of the American Revolution until the year 1815 was but gradual. At the close of the French war, however, the publication of parliamentary debates became an object of national importance, and in the course of a few years assumed its present full, detailed, and accurate character. Increased facilities for the discharge of their important and arduous duties were from time to time given to the reporters, who till then had no means of entering the Strangers' Gallery except those which were common to the public generally. Amongst the professional parliamentary reporters of this period Charles Dickens was conspicuous. He was at work for the *Morning Chronicle* in 1834, and was one of the best reporters of his time.

The system of parliamentary reporting underwent a change of great importance about 1847, when the electric telegraph was brought into general use by companies formed to work it. They proposed to supply papers out of London with London news, and a report of parliamentary debates was part of the news thus supplied. In order to get this report the Telegraph Company obtained admission to the gallery for its reporters, and thus broke the monopoly which the London daily newspapers had up to that time enjoyed. Subsequently, when the electric telegraphs passed into the hands of the government, the parliamentary reports for newspapers out of London were provided by press agencies, and the accommodation in the Reporters' Gallery had to be increased for them. With the growth of provincial newspapers the demand for more reports than the agencies supplied was felt, and the more powerful newspapers endeavoured to secure special reports for themselves by the assistance of reporters who were engaged on the London press. In this way they were able to get and publish reports often much longer than those printed in London. This, however, was only done at great inconvenience, and an effort was made to obtain for leading provincial newspapers a right of admission to the Reporters' Gallery. These claims were considered by a special committee of the House of Commons, which in 1879 reported in favour of them; next year the long-coveted privilege was granted, and the representatives of some of the provincial papers take their regular 'turns' (relieving one another at short intervals) along with those of the metropolitan dailies. See Pendleton, *Newspaper-reporting in the Olden Times and To-day* (1890).

Repoussé (Fr.). This term is applied to a peculiar method of ornamenting metal which resembles Embossing (q.v.). Briefly stated, it is metal-work formed in relief by striking the sheet, usually a thin one, from behind with a hammer or punch, the rough forms so produced being afterwards chased or otherwise finished. After the parts which require to be convex are 'raised' from the back or inside of any object, such as a vase or flat dish, it is either filled with or placed on a bed of pitch and then worked upon the face with small punches, and afterwards with chasing, engraving, and other tools. Stamping produces work somewhat similar in general appearance, but of a much more mechanical nature, since the die used determines exactly the pattern, and no variety is obtained. See DIE-SINKING. Some kinds of hammered iron, again, such as open ornamental gates and grilles, are rather examples of forging

than of repoussé. Among the best existing pieces of ancient Greek bronze sculpture some have been beaten up (not cast), and are therefore of the nature of repoussé work. A number of the famous artistic productions—notably those of the 16th century—referred to under the head METAL-WORK are executed in repoussé. This art, by which, in the hands of a master, work can be executed with a delicacy, softness, and beauty unattainable by any other process, was revived (in a true artistic sense) in France about the middle of the 19th century. Some of the finest modern works in repoussé have been executed by Antoine Vechte and Morel Ladeuil. One of the largest objects ever produced in repoussé in England is the Elcho Volunteer Challenge Shield. It is of iron, 6 feet high, and was designed by F. Watts, R.A. Elaborate work in repoussé is necessarily very costly, especially if the metal employed is hard, such as iron, copper, or silver, which is usually the case when important designs are to be executed. But the process is also applied in Birmingham to decorate comparatively cheap articles in Britannia metal, which is soft and easily worked.

Representation, in politics, is the function performed by the elected members of legislative and administrative bodies. Ancient democracies were usually constituted on the principle of government by the whole body of citizens; at Athens, for example, all important questions were decided by the vote of the Ecclesia. In England, as in many other countries, the freemen of townships and small districts elected their own officers and managed their own affairs; the shiremoot of early times was attended by the reeve and four men from each township; it was, in fact, a representative assembly, properly so called. When the smaller kingdoms were united under one head the change was not at first favourable to popular government; it was impossible in those days to bring together representatives from a wide area; and the conduct of national affairs fell into the hands of the king and his councillors and the great men of the realm. But feudal custom required that a superior should consult his vassals, or some of them, before levying any exceptional aid; under the influence of this idea courts or assemblies of a more or less representative character were formed throughout western Europe. In England the high court of Parliament (q.v.) was organised on a feudal basis, like the neighbouring parliament of Scotland; but the principle of representation was applied as early as the 13th century to the shires and boroughs of England generally.

In framing or criticising the constitution of a representative body we encounter practical questions of considerable interest. We have to determine, first, who ought to elect, whether a property qualification should be required, whether owners of property should have more than one vote, whether manhood suffrage, household suffrage, or a more limited franchise will give the best results, and whether women ought to be allowed to vote. We have then to consider how the electors are to be grouped. The scheme of single-member districts adopted in 1884–85 in the United Kingdom results in the representation of all local majorities; local minorities are excluded, and votes may be so distributed that a majority of members is returned by a minority of electors. Mr Thomas Hare (1806–91) was the author of a scheme of proportional representation, in which the whole country is treated as one constituency, each elector has one vote, and any candidate obtaining the necessary quota of votes is elected, while provision is made for transferring votes from a candidate who obtains more than the quota by enabling an elector to vote for several names in the order of his preference. It is contended that this plan, if adopted, would make the House of Commons a perfect mirror of public opinion; but the plan has not yet attracted any great amount of popular support. After the lapse of about a century the 'one man, one vote' shibboleth of Major John Cartwright (1740–1824) has been recently revived. In school board elections the voting for representatives is cumulative; the voter has a right to as many votes as there are members to be elected, and may give all his votes or as many as he chooses to one candidate. Passing from election law, we have to consider what are the duties of elected representatives, and what should be their relation to their constituents. Should they be paid? Should they have a long term of office, that they may learn their business, or a short term, that they may never forget their dependence on the electors? Are they delegates, bound to act on the instructions of those who appoint them, or is it their duty to act on their own judgment, and to do what is best for the general welfare? The accepted theory in England is that a member is not a delegate: his constituents have no power to withdraw their mandate, and the member is bound to act on his own judgment. But the highly organised parties of modern times leave very little freedom to the individual representative; he can only secure election by pledging himself to vote with his party on certain issues.

For a full discussion of these and other questions, see J. S. Mill, *Representative Government* (1861; new ed. 1884); T. Hare, *The Election of Parliamentary Representatives* (1859; new ed. 1865); Walpole, *The Electorate and the Legislature* (1881). Many interesting political experiments are described in Bryce's *American Commonwealth* (1888). For the representative system of the United States, see CONGRESS, PRESIDENT, UNITED STATES. Representation was not the original system even in republics (see REPUBLIC), but direct voting of all citizens; this old system is still practised in some of the smaller cantons of Switzerland (q.v.).

Reprieve (Fr. *reprendre*, 'to take back') is the suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of suspending all sentences at any time is vested in the crown, or chief-magistrate of a republic, at discretion; and in Britain is exercised through the Home Secretary (see SECRETARY OF STATE, PARDON). There are also several grounds on which the judge or a court reprieves a sentence. Where the judge is not satisfied with the verdict, or is doubtful of the validity of the indictment, he reprieves the sentence in order to give time for some application to the crown. When the prisoner is a pregnant woman, and pleads that fact, it is proper to put off the execution of the sentence until after her delivery. When a woman pleads her pregnancy as a reason for reprieve the traditional practice is to empannel a jury of matrons, and, if they bring in a verdict of 'quick with child,' execution is stayed. Another cause of reprieve is the insanity of the prisoner, for, if before execution it appear the prisoner is insane, whether the insanity supervened after the crime or not, the judge ought to reprieve him. A reprieve is usually followed by remission or commutation of the punishment to which the prisoner has been sentenced.

Reprisal is the retaking, from an enemy, goods which he has seized, or the capture from him of other goods, as an equivalent for the damage he has wrought. Letters of Reprisal are the same as Letters of Marque (q.v.).

Reprobation. See PREDESTINATION.

Reproduction is the term applied to the whole process whereby life is continued from generation to generation. One of the characteristics of life is

its continuity; the races of animals and the orders of plants live on without marked change for centuries; by slow modifications they may be enriched or impoverished, increased or thinned, but there is no breach of continuity. All the forms of life seem to evolutionists like twigs on one many-branched tree; they are genetically related by near or distant bonds of kinship, and in a very real sense each generation is continuous with those which come before and after it. As an evergreen tree replaces by fresh growth those leaves which it loses, so, throughout the world, by various forms of reproduction the continuance of life is secured.

As reproduction is a fundamental fact of life, it cannot be discussed apart from other facts, such as growth, at the limit of which reproduction usually occurs, or development, in which the germ grows into the likeness of its parent, or the occurrence of two sexes producing complementary and mutually dependent reproductive elements. A theory of reproduction must be consistent with the facts of growth and development, and merges into theories of sex and of heredity—the latter being based on a study of the precise relations between successive generations. See EMBRYOLOGY, HEREDITY, SEX.

Modes of Reproduction.—Separated fragments of a sponge or cuttings from the rose, the buds of a hydra, or the bulbils of a lily, the eggs of birds, and the seeds of plants are alike able to grow into new organisms; and thus we see that the common fact about all kinds of reproduction is that parts of one organism are separated to form or to help to form new lives. In many cases what is separated from the parent life is simply part of its body, an overgrowth or a definite bud, which, being set free, is able to reproduce the whole of which it is a representative sample. This we call asexual reproduction. In most cases, however, the parents give origin to special reproductive elements—egg-cells and male-cells—which combine and are together able to grow into a new life. This we call sexual reproduction.

The simplest forms of reproduction are found among the single-celled plants and animals. There we may find an organism like Schizogenes, multiplying by breakage, reproducing by rupture, presumably when the cell has overgrown its normal size; in others numerous buds are liberated at once, as in Arcella and Pelomyxa; in many, familiarly in the yeast-plant, one bud is formed at a time; in most the cell divides into two or many daughter-cells. The formation of many daughter-cells or spores is little more than ordinary division taking place repeatedly in rapid succession, and within the substance of the parent-cell—in other words, in limited time and space.

We have seen that reproduction begins among single-celled organisms in a kind of rupture; but even among the more complex forms of life an equally crude mode of reproduction sometimes occurs. The cast-off arm of a starfish may re-grow the entire animal with a readiness that suggests a habit; some kinds of worms (e.g. Nemerteans) break into pieces, each of which is able to re-grow the whole; large pieces of a sea-anemone or of a sponge are sometimes separated off and form new organisms. It is easy to show experimentally that parts cut from a hydra, a sponge, or a sea-anemone, from a seaweed, a moss, or a tree, may in certain conditions grow into an entire organism.

But the usual mode of asexual reproduction is by the formation of definite buds. When these buds remain continuous, colonial organisms result, like many sponges, most hydroids, Siphonophora like the Portuguese man-of-war, many corals, almost all the Polyzoa, and many Tunicates. The runners of a strawberry and the suckers which grow around a rose-bush illustrate the same state. But in a few plants, like the liverwort and the tiger-lily, a kind of bud may be detached, and thus begin a new life. It is among animals, however, that the liberation of buds is best illustrated, for this mode of reproduction occurs in hydra and many hydroids, in some 'worms,' and in Polyzoa, and even in animals as highly organised as Tunicates. Budding is usually exhibited by comparatively simple and by sedentary animals, and seems indeed to be natural to vegetative organisms. It is easy to understand why asexual reproduction is among many-celled animals always associated with sexual reproduction, and entirely replaced by it in the higher forms. For budding is only possible when the organism is not very highly differentiated, or when part of the body retains many indifferent units; moreover, it is an expensive way of securing the continuance of generation, and is without the advantage to the species which undoubtedly results from the mingling of two life-currents in sexual reproduction.

Sexual reproduction in its fully differentiated form involves (*a*) the distinctness of two parent organisms, (*b*) the formation of two different kinds of reproductive elements—e.g. spermatozoa produced by the male and ova by the female, and (*c*) the fertilisation of the egg-cell by a male element. Moreover, the process of sexual reproduction also includes the sexual union of the two parents, or other ways in which fertilisation is secured, while in some cases the fertilised ovum develops in organic relation with the mother-organism, from which it is eventually separated as an embryo. But, while many organisms exhibit fully differentiated sexual reproduction, and while the essentials of the process are always the same, there are not a few important variations in detail—witness the occurrence of hermaphroditism, parthenogenesis, and alternation of generations, the first and last of which are discussed in separate articles.

Physiology of Reproduction.—All growth is, in a certain sense, of the nature of reproduction. It is an increase in the amount of protoplasm and its attendant train of substances. Abundance of food material and conditions favourable to rapid assimilation are necessarily accompanied by rapidity of growth; but in the most favouring circumstances there is an inevitable limit to the growth in size of a single cell. It occurs when the rate of assimilation of the constantly increasing mass of protoplasm becomes equal to the highest possible rate of absorption. Since absorption can only take place through the surfaces, and since, with any given figure of cell, the ratio of volume to surface is a perfectly definite one, and one which increases at a definite rate as the cell grows, there must be for any given figure of cell a perfectly definite limit of size. For any mass of cells arranged in any manner there must be, for similar reasons (though other factors, such as weight, &c., may be operative and varyingly important), a definite limit of size. When in the single-celled animals this limit is reached, or is nearly reached, so that starvation begins—and in any case the greater the size of the cell the less rapid, in proportion to volume, must be the absorption, unless at a certain point other factors at present unknown occur—then division of the cell takes place, by which means, the volume remaining the same, the surface is doubled, so that the ratio of volume to surface and therefore of assimilation to absorption is lowered, and growth is once more possible. This law (first clearly stated by Spencer and by Leuckart) is evidently the expression of a factor concerned in the initiation of cell division and therefore of the Metazoa or many-celled animals. In the Protozoa, then, reproduction is related to, and in a certain sense caused by, a diminution in the possible rate of assimilation, which, to the

protoplasm concerned, bears the aspect of an impaired nutrition. In the Metazoa, although reproduction is not so entirely a mere process of cell division as in the Protozoa, a connection between nutrition and reproduction is observable. The common hydra, with an abundant food-supply and favouring circumstance, grows rapidly, the growth becoming a process of asexual reproduction and taking the form of the production of numerous buds, which may themselves produce a crop of secondary buds. But if the conditions become less favourable to nutrition through the lessening of the supply of food material, or, in terms of the more definite generalisation emphasised above, less favourable to assimilation through, say, a fall of temperature, then this rapid growth ceases and reproductive organs are formed and sexual reproduction takes place. Planarian worms in good nutritive conditions form asexual chains of daughter worms. A check to nutrition is followed by the separation and sexual maturity of the links.

Fruit trees are root-pruned in order that the crop of fruit may be abundant; the reason being that, as nutrition is lessened by such pruning, there follows an increase of reproductive activity which takes the form of fruit. If the vegetative activity of the plant be what one desires, then the flower buds are nipped off and sexual activity prevented. A similar result follows from the castration of animals. The position of the flower at the end of the vegetative axis is an expression of the fact that at that point the food-supplies are more scanty than at any other point along the axis. This distribution of food matter is shown again in such plants as the tiger-lily, which have a mode of asexual reproduction, one that is of continuous growth, by the development of little bulbils which occur in the axis of the leaves, such bulbils being only found on the lower part of the stem. Other factors than the supply of food-matter influence assimilation and reproduction. As in the case of all molecular movements, variations of temperature are an obvious cause of change of state. For every animal—i.e. for every peculiar form of protoplasm—there is a particular temperature which, other things being constant, is most favourable to rapidity of assimilation. This point is widely different in the various forms of life. In every case it is probable that a rise of temperature up to a certain point is followed by a feverish state of body and a tendency to hasten sexual maturity and reproduction. If our conception of the relation of assimilation to reproduction be correct, then, as already suggested, a fall of temperature below that most favourable to assimilation ought to be followed by an increasing tendency to sexual reproduction.

Reproductive maturity—the blossoming of the individual life—occurs, as we have seen, about the time when growth ceases. In the lower animals sexual maturity is attained relatively sooner than in the higher forms; but there are many strange cases of precocious and retarded reproduction. Thus we may contrast our common annuals and the 'century plant' or American aloe, or some midges, worms, and even a couple of amphibians, which are reproductive during larval life, with highly evolved animals, such as the elephants. The physiology of reproduction must take account of that profound reaction which affects the whole system as sexual maturity is attained, of the various ways in which the reproductive elements are separated from the parents, of the relation which, alike in plant and animal, may be established between the fertilised egg-cell and the mother-organism, and of the way in which an embryo thus nurtured eventually becomes independent. Moreover, there are often highly evolved psychical activities associated with reproduction—notably the love between mates and between parents and offspring.

But, while reproduction is a blossoming of the individual life, it is also in a sense the beginning of death. The flower and fruit often end the life of the plant. It may be that the processes of rupture by which some of the simplest organisms reduce their bulk and multiply their kind are but a few steps from the more diffuse dissolution of death. It is a fact that in some simple animals—e.g. some 'worms'—the parent, and especially the mother, ruptures and dies in liberating the reproductive elements. So, among higher forms, not a few insects—mayflies, locusts, butterflies—die a few hours after reproduction. The exhaustion is fatal, and the males are sometimes victims as well as their mates. In higher organisms the fatality of the reproductive sacrifice has been greatly lessened, yet death may tragically occur, even in human life, as the direct nemesis of reproduction. In short, the process by which new lives begin, by which the continued life of the species is secured, tends to be antagonistic to the life of the parent individuals. The old leaves fall off the tree, and their places are filled by others.

The Rate of Reproduction and Increase.—The rate of reproduction depends upon the constitution of the individual organism and on its immediate environment and nutrition. The rate of increase, which is much more difficult to estimate, depends upon the wide and complex conditions of life which are often included in the phrase 'the struggle for existence.' While it is true that organisms sometimes exhibit an extraordinary increase in numbers in favourable areas and seasons, and while we know of many forms and even of whole races which have dwindled away and become extinct, the fluctuations in the numbers of plants and animals seem for the most part to be imperceptibly gradual. Their rate of reproduction is adjusted to the conditions of their life; the rise or fall of the population is seldom emphatic. The essay of Malthus (1798), in which he showed that the increase of human population tended to outrun the means of subsistence, but was met by various checks, afforded suggestions to Darwin and Wallace, who extended the induction of Malthus to plants and animals, recognising in their increase the fundamental condition of the struggle for existence, and analysing the checks as various forms of natural selection. But Herbert Spencer's analysis of the laws of multiplication was even more penetrating. Including under the term individuation all those race-preservative processes by which individual life is completed and maintained, and under the term genesis all those processes aiding the formation and perfecting of new individuals, he showed both inductively and deductively that individuation and genesis vary inversely. Genesis decreases as individuation increases, but not quite so fast; in other words, progressive evolution in the direction of individuation is associated with a diminishing rate of reproduction.

The Importance of Reproduction in Evolution.—As almost every individual life begins in the intimate union of two living units—the male-cell and the egg-cell—there is in the nature of the organism's beginning an evident possibility of variation. The two cells, and more especially the nuclei of the two cells, are intermingled; and in the vital combination which results new characteristics may be evolved, old features may be strengthened, peculiarities may be averaged off. On fertilisation as a source of variation, emphasis has been laid by Treviranus, Galton, Brooks, and others, while Hatschek regards the intermingling as an important counteractive of disadvantageous individual peculiarities, and Weismann finds in it the

sole source of transmissible variations in many-celled animals.

In the individual life the antithesis between the reproductive and the nutritive functions has many expressions, and in terms of this antithesis not a few lines of variations can be rationalised. Thus, the shortening of the axis of the flower seems to be the result of a check imposed upon the vegetative system by the reproduction function; thus, the development of gymnosperm into angiosperm suggests a continuous subordination of the reproductive carpellary leaf; thus, in almost every natural alliance of phanerogams may be read a contrast between more and less vegetative types, such as is seen within the limits of a single species in the transitions between the leafy kale and the cauliflower. Among animals the antithesis is expressed in different ways—as in the varied degree in which the reproductive individuals of a hydroid colony are differentiated from the nutritive members.

In considering the evolution of animals great importance is always—and rightly—attached to the self-preserving struggles and endeavours which secure the satisfaction of nutritive needs; but the species-maintaining activities of reproduction have been not less important. Thus, Darwin insisted on the importance of sexual selection as a factor in evolution, and, though the criticisms of Wallace and others have lessened the cogency of Darwin's argument, there can be little doubt that courtship has aided in the evolution of the psychical life of animals. Romanes, too, in his insistence on the importance of isolation, recognises 'the reproductive factor in evolution.' For by variations in the reproductive system a species may be divided into mutually sterile sets, which, prevented from intercrossing by this physiological barrier, are free to develop along divergent paths. In a very different connection, Robert Chambers emphasised the importance of 'prolonged gestation,' and Fiske has directed attention to the progressive influence of prolonged infancy, while Miss Buckley has well pointed out that an increase of parental care and sacrifice as seen in birds and mammals has surely been a factor in, as well as a result of, the general ascent of animals.

The increase of reproductive sacrifice which we observe in the evolution of mammals and in the progress through oviparous monotremes, prematurely-bearing marsupials, and various grades of placentals; the growth of parental care, and the frequent subordination of self-preserving to species-maintaining ends; and finally, the rise of sociality from foundations based in organic kinship, are well-known facts of animal life which suggest the importance of the reproductive factor in evolution.

See EMBRYOLOGY, HEREDITY, SEX; H. Spencer, *Principles of Biology* (Lond. 1864-66); E. Haeckel, *Generelle Morphologie* (Berlin, 1866); V. Hensen, *Physiologie der Zeugung*, in Hermann's *Handbuch der Physiologie* (Leip. 1881); article 'Reproduction,' by P. Geddes and S. H. Vines, in *Ency. Brit.*; A. Weismann, *Papers on Heredity*, &c. (Oxford, 1889); P. Geddes and J. A. Thomson, *Evolution of Sex* (Lond. 1889).

Reptile-Fund, the fund so called, described at HANOVER, Vol. V. p. 547, was abolished by Caprivi in 1890.

Reptiles, a very large class of Vertebrate animals, including Tortoises and Turtles, Lizards of many kinds, the divergent New Zealand 'lizard' Sphenodon, Snakes, and Crocodilians—five distinct orders with living representatives, but including also at least as many orders of wholly extinct types, such as Ichthyosaurs, Plesiosaurs, and Deinosaurs.

Reptiles occupy a central position in the Vertebrate series: beneath them are Amphibians and Fishes, above them are Birds and Mammals. They begin the series of 'higher Vertebrates,' which at no period of life breathe by gills, which in embryonic life are provided with two birth-robes or fœtal membranes—a protective amnion and a respiratory allantois. Their relationships seem to be threefold, with the Amphibians, with Birds, and with Mammals. But there is no doubt that they are most closely linked to Birds—a fact first clearly recognised by Huxley, who emphasised the deep structural affinities of Birds and Reptiles by linking them together as Sauropsida, in contrast to Mammalia on the one hand and Ichthyopsida (Amphibians and Fishes) on the other.

Referring to the article BIRDS for a contrast between Mammals, Birds, and Reptiles, we shall simply notice that Reptiles are cold-blooded, the temperature of the body not greatly exceeding that of the surrounding medium; that the heart is three-chambered, except in Crocodilians, where four chambers first occur; that mostly venous blood goes from the heart to the anterior viscera, and mixed blood to the posterior region, only the head and anterior regions receiving purely arterial blood; that the body is covered with scales, with which subjacent bony plates or scutes are sometimes associated; that the skull articulates by a single condyle with the backbone, and the lower jaw works against the quadrate bone; that the great majority are oviparous, while in some the eggs are hatched within the mother. The earliest remains of Reptiles are found in Permian strata, and the golden age of Reptiles was in Mesozoic, especially in Jurassic and Cretaceous, times.

Classification of Living Reptiles.—As the orders of Reptiles with living representatives are separately discussed, it will be enough here to give a general classification. Order 1, Chelonia: Tortoises and Turtles. 2, Rhynchocephalia: one form—the New Zealand lizard Sphenodon (q.v.), whose extinct ancestors date from the Permian. 3, Lacertilia: Lizards (q.v.). 4, Ophidia: Snakes (q.v.). 5, Crocodilia: Crocodiles (q.v.), Alligators (q.v.).

EXTINCT REPTILES.—The classification of the extinct Reptilian types is still very uncertain; but many authorities agree in recognising the following orders:

Anomodontia.—Reptiles with lizard-like body, limbs adapted for walking, biconcave vertebræ, and teeth fixed in sockets. The order is restricted to the Permian and Trias, and exhibits affinities with the Labyrinthodont Amphibians and with Mammals. Among the representative genera are Pariasaurus, Galesaurus, Deuterosaurus, Dicynodon, and Placodus.

Sauropterygia.—Reptiles without exoskeleton, with long neck and short tail, limbs adapted for walking or for swimming, biconcave vertebræ, teeth fixed in sockets. All of them seem to have been carnivorous. The order is represented from the Trias to the Upper Chalk, and exhibits affinities with Amphibians. Among the representative genera are Plesiosaurus, Mesosaurus, and Nothosaurus.

Ichthopterygia.—Marine Reptiles, with whale-like body, without exoskeleton, with limbs modified as paddles, with biconcave vertebræ, with teeth implanted in a continuous groove. Many were carnivorous and fed on fishes. Seeley has shown that some were viviparous, the fossilised young being found in the fossilised mothers. The order is represented from the Upper Trias to the Upper Chalk, and exhibits affinities with Labyrinthodont Amphibians and with the New Zealand 'lizard' Sphenodon. Among the genera are Ichthyosaurus and Opthalmosaurus. Some attained a length of 30 to 40 feet.

Rhyncocephalia.—As Sphenodon is the only

surviving representative of the Rhyncocephalia, the order may be almost regarded as extinct. It is represented by Palæohatteria from the Permian, besides Champsosaurus, Hyperodapeton, Rhynchosaurus from later strata. Within or near this order may also be included a remarkable form Proterosaurus from the Permian, a type for which Seeley has established a distinct order, Proterosauria. The special interest of these forms is, according to Baur, that they 'are certainly the most generalised group of all reptiles, and come nearest, in many respects, to that order of reptiles from which all others took their origin.'

Dinosauria.—The largest land Reptiles of crocodilian or more bird-like form, represented from the Trias to the Upper Chalk, exhibiting affinities with crocodiles and with birds. Representative genera are Iguanodon (sometimes measuring about 30 feet), Camptosaurus, Scelidosaurus, Stegosaurus, Ceratops (with long horns on the skull), Megalosaurus, Ceratosaurus (also horned), Brontosaurus (upwards of 50 feet in length), Atlantosaurus (with a femur 6 feet long).

Ornithosauria.—Flying reptiles, often called Pterodactyles, with a fold of skin extended on the greatly elongated outermost finger. The order is represented from the Lias to the Upper Chalk by such genera as Pteranodon, Pterodactylus, Dimorphodon, and Rhamphorhynchus. Some had an expanse of wing of about 25 feet, but many were small. Their affinities are uncertain.

See Huxley, *Anatomy of Vertebrated Animals* (1879); Nicholson and Lydekker, *Manual of Palæontology*, vol. ii. by Lydekker (Edin. 1890); Hoffmann in Bronn's *Klassen und Ordnungen des Thierreichs* (Leip., in progress); Duméril and Bibron, *Erpétologie Générale* (9 vols. Paris, 1834–54); British Museum Catalogues by Boulenger &c.; Holbrook, *North American Herpetology* (Phila. 5 vols. 1836–42).

Repton, a village of Derbyshire, 6½ miles SSW. of Derby and 4½ NE. of Burton-upon-Trent. Here was founded the first Christian church in Mercia, of which Repton for a while was the royal and episcopal capital. It was the seat from before 660 till its destruction by the Danes in 874 of a celebrated nunnery, as afterwards of an Austin priory from 1172 till the Dissolution. Remains of this priory are incorporated in the buildings of the free grammar-school, which, founded in 1556 by Sir John Porte, has risen to be one of the great English public schools, with an endowment of £2000, eight scholarships and several entrance exhibitions, some 20 masters, and 275 boarders. Among former pupils have been Justice Denman, Bishop Piers Claughton, Professor Sanday, and J. E. Sandys, the public orator at Cambridge. The parish church has a graceful spire and a very interesting Saxon crypt, 17 feet square. Pop. of parish, 2060. See Bigsby's *History of Repton* (1854).

Republic (Lat. *res publica*, 'the public good'), a political community in which the sovereign power is lodged, not in a hereditary chief, but either in certain privileged members of the community or in the whole community. According to the constitution of the governing body, a republic may therefore vary from the most exclusive oligarchy to a pure democracy. The several republics of Greece and that of Rome were, at the outset at least, aristocratic communities. The mediæval republics of Venice, Genoa, and the other Italian towns were also more or less aristocratic. The sovereign power was held to be vested in the franchised citizens, and every function—legislative, executive, or judicial—not exercised directly by that body could only be exercised by parties deriving their authority from it. But the extent of the franchise, and the mode of exercising it, varied much in these civic communities; and the most prosperous and long-lived was Venice, which was also the most aristocratic of them all. In the 16th century the Seven Provinces of the Netherlands, on their revolt from Spain, adopted a republican form of government, as did Switzerland on becoming independent of the German empire. Great Britain was nominally a republic for eleven years (from 1649 to 1660). France was a republic from 1793 to 1805, and from 1848 to 1853; and the republic was again proclaimed 4th September 1870. Such government as Spain had between February 1873 and December 31, 1874, was of a republican form. Switzerland is also a republic; since 1848 more democratic than formerly. The other republics of Europe are the diminutive states of San Marino and Andorra, and, in certain respects, the free cities of Hamburg, Bremen, and Lübeck. The most important of modern republics is that of the United States of America, where pure democracy has been tried on a scale unknown elsewhere. Except during the short-lived empire of 1863–67, Mexico has been a republic since 1824. Since the revolution in Brazil in 1890 all the South American states (omitting the three Guiana dependencies) are republics. In the republics of the ancient world the franchised classes exercised their power directly without any system of delegation or representation. The same was at first the case in the Swiss cantons, where, however, representative government has been gradually but generally introduced. Modern republics have been founded on the representative, not the direct, system, which can hardly exist except in a community that is very small and concentrated as to space. Switzerland and the United States of America are *federal* republics, consisting of a number of separate states bound together by a treaty, so as to present to the external world the appearance of one state with a central government, which has the power of enacting laws and issuing orders that are directly binding on the individual citizens. The constitutions of the various republican countries are discussed under their several heads: see especially Athens, Rome, Venice, Switzerland, France, and United States.

Republican, a party name in American politics, which has had at different times different significations. In the first years of the Republic it was the alternative title of the Anti-federalists, who advocated the sovereignty of the states and the rights of the people, and finally secured those amendments and additions to the Constitution which were intended to guarantee state rights, and which declared that all powers not expressly granted to congress by the Constitution are retained by the states or the people. Before the war of 1812, however, the term Democrats (q.v.) had been substituted as the title of the party; and the name of Republicans went out of use until 1856, when it was taken up by the new party which was organised to oppose the Democrats, its original holders. This party was formed to combat the extension of slavery; it appealed to all who were opposed to the repeal of the Missouri Compromise (see Missouri) and the efforts to make Kansas a slave state (see Kansas). It grew out of the Free-soil party (see Free-soilers), and at once took the place, as opponents of the Democrats, that the Whig party, which had died of over compromise, had for some time feebly held. In 1856 it nominated Frémont for the presidency, and made a good fight. The decision in the Dred Scott Case (q.v.) and the progress of events in Kansas greatly strengthened the party, and after the divisions among the Democrats over the same question in 1860 the success of the Republicans was assured. Electing Lincoln in that year, they held office

continuously from 1861 to 1885, the Republican presidents being Lincoln, Johnson, Grant (twice), Hayes, Garfield, and Arthur; and in 1888 they were again successful, electing Benjamin Harrison. The conduct of the civil war was in the hands of the Republican party, although, of course, northern Democrats formed a large proportion of the Union armies. For its history, see UNITED STATES; and see also SLAVERY. The strength of the party is in the north and west. Republicans claim great credit for their management of the finances of the nation, which brought about the resumption of specie payment. The slavery question has passed into history, and, although the actual enfranchisement of the southern negroes may demand the attention of the party, the principal opposition between Republicans and Democrats now is on the question of tariff, the former being strong protectionists, the latter advocating tariff revision and the placing of some articles on the free list.

See *The Republican Party*, edited by J. D. Long (New York, 1892).

Republican Bird. See WEAVER BIRD.

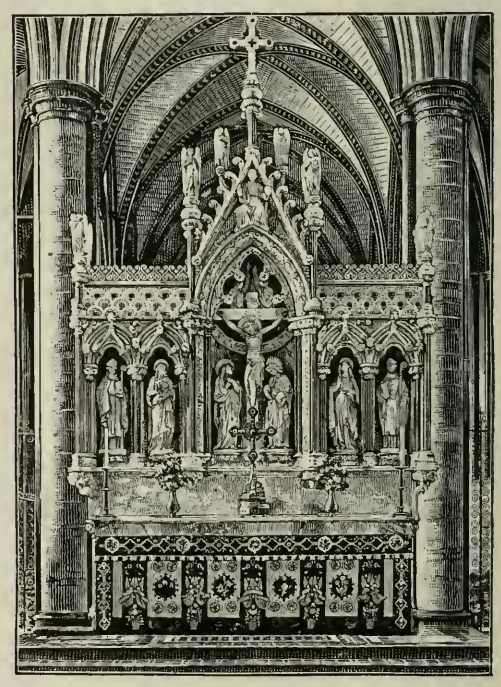
Repudiation, an unprincipled method for the extinguishment of a debt, by simply refusing to acknowledge the obligation, which has been adopted notoriously by several states of the American Union; Hayti has been the next worst offender. The eleventh amendment of the Constitution of the United States prohibits citizens of another or a foreign state from bringing suits against a state in the federal courts; while the individual states, not being independent sovereigns, could only be called to account by a foreign power through the national government. Reprisals or war are thus as impossible as a suit at law, and there is really no means by which the states can be compelled to recognise and meet their obligations. Twice in the history of the country have several states taken advantage of this condition of affairs—once after the commercial crisis of 1839, in which the United States Bank stopped payment, and again in the years following the civil war. In the latter period Virginia, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Arkansas were among the defaulters. Virginia, indeed, refused payment chiefly on the ground that no part of its existing debt had been allocated to West Virginia when the latter was separated as a state in 1863; and later acts of repudiation have found a local justification in the same grievance. But in the other states repudiation is to be traced to the effects of the war and to the unsettled government which ensued. The rebellion had left commerce in these states prostrate and paralysed, and especially was it necessary that railways should be rebuilt and new roads constructed; and to this end the public credit was pledged, often recklessly and at ruinous rates. In most cases the debts created in aid of railways were repudiated on the ground that the money had been obtained collusively and with no proper return of benefit to the states: North Carolina thus wiped off an obligation of more than $12,000,000. The other states mostly based their action on decisions of their own courts or on the action of their own legislatures; but such decisions are to be regarded as *ultra vires*, and in their action the states were not justified by law at all, but were simply taking advantage of the fact that they could not be compelled to pay.

Requeña, a town of Spain, 37 miles W. of Valencia, cultivates silkworms, saffron, and fruits. Pop. 13,527.

Requests, COURT OF, an ancient court of equity in England, inferior to the Court of Chancery, and abolished 1641. Also, a local tribunal (known likewise by the name of Court of Conscience) instituted in London by Henry VIII. for the recovery of small debts. Similar local tribunals elsewhere have all been superseded by the county courts.

Requiem (Lat. *requies*, 'rest'), a dirge or solemn service for the dead in the Roman Catholic Church. It consists in the celebration of the mass *Pro Fidelibus Defunctis* ('For the Faithful Departed'), the first words of the Introit of which are *Requiem æternam*.

Reredos (Fr.), the wall or screen at the back of an altar. It is usually in the form of a screen detached from the east wall, and is adorned with niches, statues, &c., or with paintings or tapestry. In some cases it is attached to the east wall and is of great size, covering the whole of the wall, as at All Souls College, Oxford. That splendid 15th-century reredos had been plastered over at the Reformation, but was discovered and restored in 1872–76. In Durham Cathedral is a very fine example of a reredos in the form of a detached screen; it was brought by sea to Newcastle from London by Lord Neville in 1380, being perhaps of French workmanship, and was restored in 1846. The lofty reredos (*c.* 1480) at St Albans, dividing the presbytery from the retro-choir, is of the same type and age as that at Winchester.



Reredos, Salisbury Cathedral.

Reredoses have frequently been erected in the later half of the 19th century, a good example being that of Salisbury, designed by Sir G. G. Scott, and erected in 1875 at the cost (£1800) of Earl Beauchamp to take the place of one demolished about 1790 by Wyatt. Owing to the imagery they contain, they have been the subject of controversy in the Church of England—e.g. in the case of the Exeter reredos (1873–75), and of that of St Paul's (1889–91), both of which were allowed, after frequent appeal, to remain.

Rescripts (Lat. *rescripta*), answers of the popes and emperors to questions in jurisprudence

officially propounded to them. *Rescripta principis* were one of the authoritative sources of the civil law, and consisted of the answers of the emperor to those who consulted him, either as public functionaries or as individuals, on questions of law. They were often applied for by private persons, more especially women and soldiers, to solve their doubts or grant them privileges. The rescripts directed to corporate and municipal bodies were known as *Pragmaticæ sanctiones*, a name which has found its way into the public law of Europe (see PRAGMATIC SANCTION). Rescripts might gradually come to have the force of law, in so far as their determinations in particular cases were of general application.

Rescue, in English law, is the illegal delivery and discharge of a prisoner or of goods out of the custody of the law. If, for example, a tenant whose goods are distrained for rent take them by force from the bailiff, the distrainer has a right of action against the person who rescues the goods. A person who rescues a prisoner accused or convicted of treason, felony, or misdemeanour is himself deemed to be guilty of treason, felony, &c.; the punishment varies with the gravity of the charge. A person who rescues or attempts to rescue a murderer going to execution is liable to penal servitude for life.

Resedaceæ, a natural order of plants, mostly herbaceous, having alternate leaves and terminal spikes of hermaphrodite irregular flowers. There are some forty known species, mostly natives of Europe and the west of Asia, and mostly mere weeds. Weld (q.v.) and Mignonette (q.v.) are the species most worthy of notice.

Reservation, MENTAL (Lat. *reservatio* or *restrictio mentalis*), the act of reserving or holding back some word or clause which is necessary to convey fully the meaning really intended by the speaker. It differs from equivocation (Lat. *equivocatio* or *amphibolia*) in this, that in the latter the words employed, although doubtful, and perhaps not fitted naturally to convey the real meaning of the speaker, are yet, absolutely speaking, and without the addition of any further word or clause, susceptible of that meaning. Few questions in casuistry have excited more controversy, or have been the subject of fiercer recrimination, than that of the lawfulness of equivocation and mental reservation. In the celebrated *Letters* of Pascal (q.v.) against the Jesuits it was one of the most prominent and, used as he employed it, the most effective topics; and Pascal's charges against the Jesuit casuistry of that day have been repeated in almost every popular controversy on the subject which has since arisen. There are several varieties of mental reservation, differing from each other, and all differing from equivocation. But as regards the morality of the subject all the forms of language calculated to deceive may be classed together. Mental reservation is of two kinds, *purely mental* and *not purely mental*. By the former designation is meant a mental reservation which cannot be detected, whether in the words themselves, or in the circumstances in which they are spoken. Of this kind would be the mental reservation implied if a person, on being asked if he had seen A. B. (whom he really had just seen *walking* by), were to reply: 'I have not seen him,' meaning '*riding on horseback*.' A 'not purely mental' reservation is that which, although not naturally implied or contained in the words, may nevertheless be inferred or suspected, either from them or the circumstances in which they are used. Of this kind would be the mental reservation of a servant, in giving the ordinary answer to a visitor's inquiry for his master: 'Not at home,' although his master were really in the house; or that of a confessor, who, in a country where the privileges of the secret of the confessional are known and admitted, on being asked whether a certain person had committed a crime, which the confessor knew from his confession that he had committed, should answer: 'I do not know,' meaning 'outside of the confessional.' And, in general, all such doubtful forms, whether of mental reservation or of equivocation, may be divided into *discoverable* and *undiscoverable*. Much of the odium which has been excited against the casuists for their teaching on this head has arisen from the confusion of their views as to these two classes of mental reservation.

According to the most approved Catholic authorities, 'purely mental' reservations and 'absolutely undiscoverable' equivocations are held to be in all cases unlawful, such forms of speech being in truth lies, inasmuch as they have but one real sense, which is not the sense intended by the person who uses them, and hence can only serve to deceive. This doctrine is held by all sound Catholic casuists, and the contradictory doctrine is expressly condemned by Pope Innocent XI. (Propp. 26, 27). On the contrary, mental reservations 'not purely mental' and 'discoverable' equivocations are held to be not inconsistent with truth, and in certain circumstances, when there is necessity or weighty reason for resorting to them, allowable. An historical example of such equivocation or reservation is in the well-known answer of St Athanasius to the question of the party who were in pursuit of him, and who, overtaking him, but not knowing his person, asked what way Athanasius had gone. '*He is not far off*,' replied Athanasius, and the party passed on in pursuit. And an ordinary example of discoverable mental reservation is that of a person who, on being asked by one to whom he could not with safety give a refusal, whether he has any money, should reply: 'No,' meaning, 'none to lend to you.' In order, however, to justify the use of these devices of speech, casuists require that there shall be some grave and urgent reason on the speaker's part; as, for example, the necessity of keeping a state secret, or a secret of the confessional, or of a professional character, or even the confidence entrusted by a friend, or the ordinary and fitting privacy which is required for the comfort and security of domestic life and of the peaceful intercourse of society; and that the concealed sense of the form of speech employed, although it may be *actually undiscovered*, and even unlikely to be discovered, may yet be, in all the circumstances, *really discoverable*. Some Protestant moralists admit that in some cases even equivocation is permissible; if any such reservations are allowed it is obvious there must be great difficulty in drawing a line between reservations that are permissible and those that are not. See CASUISTRY; Liguori's works; and Cardinal Newman's *Apologia*.

Reservation of the Sacrament. See LORD'S SUPPER, Vol. VI. p. 717.

Reserved List, in the Royal Navy, a device which formerly existed for expediting the promotion of officers who were still of an age for active service. Under certain Orders in Council of 1851 and 1853, old officers of good service were selected for promotion to the next grade on the Reserved List. This formed a bar to any further promotion; and removed the officer from active employment, except in the remote contingency of the Active List being exhausted, when these 'reserved' officers were liable to be called upon to serve. For all practical purposes, however, the Reserved List was a retired list. The officers placed on it obtained the half-pay of the rank to which they were

promoted, and their removal gave vacancies for the promotion of younger and more efficient men. This list has practically died out; in December 1890 there were only six admirals and six commanders remaining on it, and under the Retirement Scheme of 1870 absolute retirement according to age was substituted.

Reserves. In the organisation of the military resources of most European countries the *reserve forces* are, first, those soldiers who, having served some time in the regular army, are still liable to be called upon to rejoin it when raised from a peace to a war establishment on mobilisation; and secondly, those who are liable to be called upon to follow in second and third lines if the occasion requires. Thus, in Germany and Austria the regular army and its reserves have behind them the Landwehr and Landsturm. In France the Territorial Army and its reserves form the second line, and in Russia the militia takes a similar position. Liability to serve in one or other of these reserves lasts generally from about the age of twenty to forty-two.

In Great Britain there are two reserves—viz. the Army Reserve and the Militia Reserve. The first consists of two classes, but the second class, a few pensioners of Chelsea and Greenwich hospitals, is gradually disappearing, and is practically non-existent. The first-class *Army Reserve* (some 79,000) consists of men who have served from three to eight years in the regular army, and are liable during the remainder of their twelve years' term of enlistment to be called back into the ranks in case of national danger or great emergency. They can be called out for twelve days' training in each year and in aid of the civil power, are paid £9 a year quarterly in arrear, and may re-engage for a further term of four years' reserve service at 4d. a day. They are called to the ranks by proclamation of Her Majesty in council, the occasion being first communicated to parliament if sitting. The *Militia Reserve* (about 30,000) consists of militiamen who, for an extra £1 annual bounty, take the liability to be called upon to serve in the regular army abroad or at home whenever the army reserve is called out on permanent service. The rest of the Militia (q.v.), the yeomanry, and the volunteers form a second line of defence for the United Kingdom in case of invasion. In 1899–1900, during the South African war, the whole of the Army Reserves were called out for active service; the whole Militia and part of the Militia Reserves were also called out for service in Africa, the Mediterranean, and at home; a large force of yeomanry and volunteers also volunteered for active service in Africa, and a special force of men who had passed through the army and reserves were also temporarily raised for home garrison duty during the war. The native army of India has two reserves, active and garrison. The first is formed of men who have served not less than five or more than twelve years with the colours; the second, of those who have completed twenty-one years colour service.

A reserve on the battlefield is a body of troops held back by the commanding officer so as to be ready to meet a counter-attack, to support a success, or cover a retirement. The *Naval Reserve* (q.v.) is the subject of a separate article.

Resetting, or RECEIVING. See THEFT.

Reshd, a town of Persia, capital of the province of Ghilan, stands near the south-west shore of the Caspian Sea, 150 miles NW. of Teheran. Silk is grown and manufactured, and rice and tobacco are cultivated. Pop. 25,000.

Residuary Legatee. See LEGACY.

Re'sina, a town of Italy, on the site of ancient Herculaneum, 4 miles SE. of Naples, at the foot of Vesuvius and facing the sea. Pop. 13,626.

Resins, a class of natural vegetable products composed of carbon, hydrogen, and oxygen. They are closely allied to the essential oils, all of which, when exposed to the air, absorb oxygen, and finally become converted into substances having the characters of resin; and in most cases they are obtained from the plants which yield them mixed with and dissolved in a corresponding essential oil. Like the natural oils, the natural resins are usually mixtures of two or more distinct resins, which admit of separation by their unequal solubility in different fluids.

The following are the general characters of this class of compounds. At ordinary temperatures they are solid, translucent, and for the most part coloured, although some are colourless and transparent. Some are devoid of odour, while others give off an aromatic fragrance from the admixture of an essential oil. In their crude state they never crystallise, but are amorphous and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are usually described as non-volatile, but it has been shown that common resin may be distilled in a current of superheated steam. They are insoluble in water, but dissolve in alcohol, ether, and the essential and fixed oils. They are insulators or non-conductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are divisible into the *hard resins*, the *soft resins*, and the *gum-resins*. The hard resins are at ordinary temperatures solid and brittle; they are easily pulverised, and contain little or no essential oil. Under this head are included copal, the varieties of lac, mastic, and sandarach, and the resins of benzoin (commonly called gum-benzoin), jalap, guaiacum, &c. The soft resins admit of being moulded by the hand, and some of them are viscous and semi-fluid, in which case they are termed *balsams*. They consist essentially of solutions of hard resins in essential oils, or admixtures of the two. They become oxidised and hardened by exposure to the air into the first class of resins. Under this head are placed turpentine, storax, balsam of copaiba, and the balsams of Canada, Peru, and Tolu. The gum-resins are the milky juices of certain plants solidified by exposure to air. For these, see GUM.

The resins are very widely diffused throughout the vegetable kingdom. They are generally obtained by making incisions into the wood of the trees which produce them; sometimes, however, they exude spontaneously, and in other cases they require to be extracted from the wood by boiling alcohol. The crude resins are separated from the essential oils with which they are usually mixed by distillation with water, the resin remaining while the oil and water pass off; and from the gummy and mucilaginous matters by alcohol, which dissolves out the pure resins, which can be precipitated from their alcoholic solution by the addition of water. The resins are extensively employed in medicine and the arts.

Various fossil resins are known, of which the most important is Amber (q.v.). Some chemists place bitumen and asphalt amongst this class; and amongst the fossil resins described by mineralogists may be mentioned Fichtelite, Hartite, Idrialite, Ozokerite, Scheererite, Xyloretin, &c.

The common resin, or rosin, of commerce exudes

in a semi-fluid state from several species of pine, especially *Pinus tæda*, *P. mitis*, *P. palustris*, and *P. rigida* of North America, *P. pinaster*, *P. pinea*, and *P. Laricio* of southern Europe, and *P. sylvestris* of northern Europe. The crude article, consisting of turpentine and resin proper, is subjected to distillation, when the resin alone remains behind. The resin thus procured is used very extensively in the manufacture of common yellow soap, also for sizing paper and various other purposes, including the preparation of ointments and plasters in pharmacy.

The other resins most generally known and used in Europe, and here all treated in separate articles, are Anime, Copal, Dammar, Mastic, Sandarach, Frankincense, Lac, and Kauri Gum.

Res Judicata, in Law, means that the subject-matter of an action has been already decided by a court of competent jurisdiction. A matter so decided cannot again be made a ground of action, as between the same parties.

Resolution, in Music, the relieving of a discord by a following concord; see HARMONY. For the Resolution of Forces, see COMPOSITION.

Resorcin. See DYEING, Vol. IV. p. 141.

Respiration, or BREATHING, is a part of the life of all organisms, animal and vegetable. It is a series of chemical changes, the first of which is the absorption of oxygen into the body, and the last of which is the excretion of carbonic acid. The association of this intake of oxygen and excretion of carbonic acid with the same organs, the lungs, is due to the fact that both the food-stuff and the waste-stuff are gases, and not to any immediate connection between them. Necessarily any organ adapted to the diffusion of a gas from the air into the blood must also be adapted for the diffusion of a gas from the blood into the air; that is, supposing that the living membrane, of which the lung essentially consists, which separates the air from the blood, acts, so far as the diffusion of gases is concerned, as a dead membrane; even if it has any effect arising from the fact of its being a living membrane it is probable that it will behave in a similar way to both the ingoing and outgoing gases. We shall first describe the process as it occurs in man and other Mammalia, and then give a sketch of comparative respiration, the various methods adopted in other types of animals for effecting the same purpose. The respiration of plants is dealt with in the article on VEGETABLE PHYSIOLOGY. For the general relation of the function of respiration to the other bodily functions, see PHYSIOLOGY.

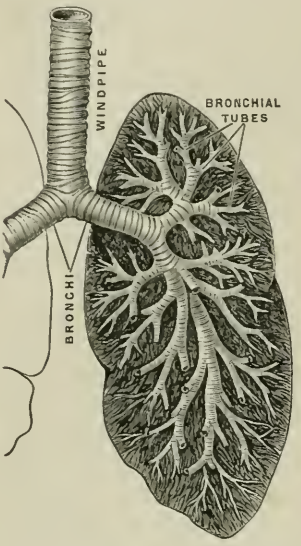
In all animals in which the parts of the body are nourished by the circulation of a stream of food material, the blood, there must always be two distinct sets of processes to consider: (1) the maintenance of the blood in a normal state, by the supply of fresh food-matter from time to time, and by the elimination of waste-matter; (2) the nutrition of the individual tissues and cells of the body by the blood-stream (see CIRCULATION). Applying this to the function of respiration, we shall have to consider (1) the manner in which oxygen is supplied to the blood and carbonic acid gas removed from it; (2) the manner in which the cells are able to take oxygen out of the blood and cast into it their useless carbonic acid; also the changes that take place within the cells between the intake of the oxygen and the output of the carbonic acid. These two sets of processes are usually described as the outer and the inner, or tissue, respiration. Some writers include in the term outer respiration the absorption of oxygen by the cells from the blood, and the excretion of carbonic acid into the blood, and restrict the term inner respiration to the actual changes that take place within the cells. It is evident that outer respiration corresponds to the processes of digestion and absorption to which food materials other than gaseous are subjected. It must be evident, too, that the mass of our present information refers to outer respiration; the changes that take place within the cells, of which inner respiration is a part, are the whole mystery of the objective side of life.

OUTER RESPIRATION.—In all animals which possess a blood-stream the outer respiration is carried on by the simple diffusion of oxygen into and of carbonic acid out of the blood through a thin membrane from and into the air or water in which the creature lives. As already noted, it is possible that the fact of this membrane being a living one may in some ways modify the otherwise simple processes of diffusion. The essential structure, therefore, of all breathing organs, lungs, gills, or tracheæ, must be the same: a thin membrane exposed on the one side to the oxygen—containing medium, air or water, in which the animal lives, on the other side to the blood flowing in a network of thin-walled vessels, so that the gases that have to pass in and out of the blood are only separated from the air or water from which and into which they have to pass by thin partitions—by the membranous wall of the breathing organ, and by the thin wall of the blood-vessels. Animals such as the frog, which have thin skins, can breathe with—i.e. the gases can diffuse through—the whole surface of their bodies if the under skin is well supplied with blood-vessels. A frog for this reason can live for days without its lungs, but if its skin be rendered impervious to gases will die very quickly, even with the lungs intact. But, as all the Mammalia have thick skins, this method of breathing must be reduced to a minimum, if indeed it exists at all.

In outer respiration we have two things to consider: (1) The manner in which fresh supplies of oxygen are pumped into the lungs, while the poisonous carbonic acid gas is pumped out. This may be called the mechanics of respiration. (2) The manner in which oxygen passes from the air in the lungs into the blood, and is held in the blood, and the manner in which the carbonic acid in the blood passes out of the blood into the air-chambers of the lungs. This may be called the chemistry of respiration.

Structure of Respiratory Mechanism.—This mechanism consists of the lungs, a series of minute air-chambers with a network of capillaries in the walls, the air-passages from the air-chambers of the lungs to the outer air, and the chest-walls with their muscles, which act like bellows and change the air in the lungs. The essentials of structure that a *lung* must possess have already been emphasised. The simplest lung that we can imagine would be an elastic membranous bag, well supplied with blood-vessels, and with a pipe connecting it with the air; the most complicated that exist are essentially of that construction, the complications that occur having for their object merely the enlarging of the surface exposed to the air. Let us begin with the air-passages. There are first the nose and mouth; these join the upper part of the gullet, known as the pharynx (see illustration at DIGESTION). From the pharynx arises the windpipe (trachea); this passes through the voice-box (larynx) into the chest-cavity; there it divides into two passages (the bronchi); the bronchi go on dividing again and again, generally into two; the ultimate divisions (the bronchioles) open into clusters of air-chambers. The air-chambers are about $\frac{1}{170}$th inch in diameter. It has been estimated that there are some 725 millions

of them, and that their total surface is about 2000 square feet. The walls of the air-chambers are formed of a thin membrane in which the blood and lymph capillaries ramify. Minute openings lead from the air-chambers into the lymph spaces of the membrane. The membranous walls are partly formed of elastic tissue. It is this that gives to the lungs their elasticity. The larger air-passages (trachea and bronchi) are kept open by horseshoe-shaped plates of cartilage; muscles stretch between the poles of the horseshoe, complete the ring, and permit the size of the passages to vary, at the same time resisting over-distension when the internal pressure rises. These larger air-passages are lined by a mucous membrane, containing mucous glands; the innermost layer is a ciliated epithelium; the cilia lash upwards, and thus keep the passages free from mucus and remove foreign particles. As the passages become smaller they lose their cartilages, and the muscles form a continuous circular layer. The lungs are invested by a membrane (the visceral pleura). At the root of the lungs this membrane is continuous with a membrane which lines the chest-cavity (the parietal pleura). The space between the two is the pleural cavity; it is in reality a large lymph space, and communicates with the lymphatics of the pleura. Owing to the air-pressure within the lungs the two pleurae are closely pressed together, the lungs entirely filling the chest-cavity. If the chest-wall be punctured the lungs partially collapse owing to their elasticity, and the respiratory movements are unable to move the air in the lungs.



The Trachea (windpipe), Bronchi, and one of the Lungs in section.

The *chest* is an air-tight chamber enclosing the lungs and the heart. The walls of the chest are formed of bones (the ribs, sternum, and backbone) and muscles; the bones and muscles are so arranged that the size of the chest-cavity can be altered. In this way the chest acts as a bellows and moves air in and out of the lungs. The ribs are sloped slightly downwards, especially after an expiration; when an inspiration is taken certain muscles fix the upper ribs, and those muscles connecting the ribs to each other contract and the ribs are raised, and thus the size of the chest-cavity is increased. At the same time a flat muscle called the Diaphragm (q.v.), which separates the chest-cavity from the rest of the body-cavity, and which after an expiration is arched upwards (by the pressure of the abdominal viscera upon it, the viscera in turn being pressed upon by the abdominal walls), forcibly contracts, becomes flatter, and therefore enlarges the size of the chest-cavity, forcing the abdominal viscera downwards and causing the abdomen to protrude. (The relation of the lungs to the other main organs will be seen in the illustration at ABDOMEN; see also that at DIAPHRAGM.) In these two ways, then, the size of the chest-cavity may be increased. The result of this enlargement is that the pressure of the air within the cavities of the lungs is lowered; air therefore from without rushes through the nostrils (one ought not to breathe through one's mouth) down the windpipe into the lungs, and thus a fresh supply of oxygen is introduced. The movements which produce this result are known as the inspiratory movements. In making an expiration the reverse effects are produced; the chest-cavity is made smaller, the pressure of the air in the lungs increases, and some rushes out through the nostrils into the air until the pressures inside and outside are equalised. An ordinary expiration is effected by the elasticity of the lungs, by the fall of the ribs, unsupported by the contraction of the muscles that caused an inspiratory movement, by the elasticity of the cartilages of the ribs which were twisted during inspiration, and by the elasticity of the abdominal wall which was forced outwards by those viscera pushed downwards by the diaphragm. An ordinary inspiration is therefore the result of a number of active muscular contractions, while an ordinary expiration is the result of mere passive elasticity of the parts concerned. There are certain other respiratory movements to be considered. During inspiration and expiration the glottis (the opening between the vocal chords of the larynx; see the illustration at LARYNX) undergoes a rhythmical widening and narrowing; this movement is greater in forced than in quiet breathing. And during inspiration the nostrils dilate; in most cases perhaps the inspiration has to be rather a forced one before they do so. Forced respiration occurs when the supply of oxygen is insufficient, or when carbonic acid accumulates in the blood. Any muscle that can aid in enlarging and decreasing the size of the chest-cavity is called into play. The average amount of air, in the case of an individual 5 feet 8 inches in height, that goes in and out of the lungs at each inspiration and expiration is about 20 cubic inches; this is called the tidal air. By means of forced inspiratory movements the ingoing tide may be increased by 120 cubic inches; by means of a forced expiration the outgoing tidal air may be increased by 90 cubic inches. After the most forced expiration possible there always remain within the lungs about 90 cubic inches of air. So that if we take as deep a breath as possible, and then make as forced an expiration as we can, we shall drive out $120 + 20 + 90 = 230$ cubic inches of air. This is termed the respiratory capacity. Since the tidal air is only 20 cubic inches, and 180 cubic inches remain in the chest after an ordinary expiration, it follows the air directly changed during respiration is not that really within the lungs themselves, but is that within the nose, windpipe, and larger bronchi, the pipes that result from the branching of the windpipe. Therefore the changes of the air within the essential parts of the lungs are the result of diffusion between it and the purer air of the bronchi, aided by the rush with which the tidal air flows in.

The ordinary respiratory movements differ in the two sexes and at different periods of life. In young children the chest is altered in size chiefly by the movements of the diaphragm, and the protrusion of the abdominal wall during inspiration is therefore very marked. In men also it is the diaphragm which is chiefly operative, but the ribs are also moved. In women it is the movement of the ribs, especially the upper ones, which is the most extensive. The respiratory rhythm is the relation of the acts of inspiration and expiration to each other as regards time. It may be expressed as follows: In. = 3, Ex. = 4, pause = 3. The number of respirations in a healthy person is about fourteen

or eighteen per minute; it is greater (nearly double) in childhood. It varies according to circumstances, exercise, rest, health, disease, &c.; in disease it may fall as low as seven or rise to a hundred.

The proportion of respiratory movements to heart-beats is about one to four, or one to five; in health they vary together. Since the heart and the lungs are contained in the same air-tight cavity, it follows that the variations in size of the heart as it beats must rhythmically affect the pressure of the air in the lungs, causing a succession of minute puffs of air to leave and enter the nostrils. Similarly the alterations in pressure within the chest-cavity affect the heart. Increase of pressure or expiration must (owing to the arrangement of the valves) help the blood to flow out of the heart. Decrease of pressure or inspiration must, for the same reason, help the flow of blood into the heart. The pressure which the expiratory muscles, aided by the elasticity of the parts concerned, can exert is on the average equal to that of 4 inches of mercury. The inspiratory muscles can lower the pressure within the chest-cavity by a pressure equal to that of about 3 inches of mercury below that of the atmosphere; the greater part of the energy of the inspiratory movements is used in overcoming the elasticity of the lungs, chest-walls, and abdominal walls. The respiratory sounds are two in number: (1) the tubular sound, heard over the windpipe and the larger bronchi, probably due to friction of air in these passages; (2) the vesicular sound, heard over the whole chest during inspiration, probably caused by the sudden dilation of the small air-chambers of the lungs, and to friction in the smaller passages. During a quiet expiration there may be no sound; when present it is very soft and indistinct, probably due to the air passing out of the air-chambers.

The Nervous Mechanism of the Respiratory Movements.—Although all the muscles concerned in the movements of breathing are voluntary muscles—i.e. can be made to contract by an act of will—yet respiration is normally an entirely involuntary act. This is obvious from the fact that during sleep, or during absence of consciousness caused in any way, respiration goes on as well as during wakefulness. Further, although we may at will breathe or cease to breathe, yet we cannot by any effort of the will suspend the respiratory movements for longer than at most a few minutes at a time. We have seen how many are the muscular movements involved in breathing, and it is obvious that the adjustment as to time and intensity of contraction of all these muscles must be a very nice one—in technical phrase, they must be co-ordinated. Such co-ordination must always be the result of a nervous mechanism, and this co-ordination, together with the fact of the rhythmical nature of the respiratory movements, suggests that the whole must be under the dominance of a nervous centre. The position of this centre has been ascertained by experiment; the whole of the upper part of the brain may be removed, and yet breathing will be unimpaired; but if a certain part of the medulla (see BRAIN, and illustration, Vol. II. p. 388) be injured or removed then all respiratory movements cease at once; the centre must therefore be in that part of the medulla. The centre is bilateral, for destruction of one-half of the medulla is followed by paralysis of the respiratory muscles of that side only. Further, we must conclude that, since inspiration is in its muscular movements antagonistic to expiration, there is an inspiratory centre and an expiratory centre in each of the two halves of the respiratory centre; but, as already noted, the expiratory centre is active only in forced respiration. The similar centres on each side are so co-ordinated that they act as one centre. This compound centre then is to be regarded as regulating the respiratory movements. We have said that if the medulla be injured the respiratory movements cease at once, and that from this it is concluded that the respiratory centre is in the medulla; but in young animals it seems that the movements may continue after destruction of the medulla, or may be produced by the reflex stimulation of some centre by irritating the skin. This subsidiary centre must be in the spinal cord; but it almost certainly *is* a subsidiary centre, though the matter is not quite settled yet.

Now is the centre 'automatic' in its discharges of nervous impulses, or is it reflexly stimulated into action by the arrival of stimuli from some other part of the body? We know by ordinary experience that the centre may be influenced from without, by impulses arising from higher parts of the brain, as when by will we alter the respiratory rhythm, or when it is affected by emotions, and also by impulses arising from the stimulation of sensory surfaces, as when cold water is dashed against the skin. It is found by experiment that the centre may be influenced in two distinct ways: (1) by nervous impulses; (2) by changes in the blood.

Nervous impulses may affect either the inspiratory or the expiratory part of the centre. It seems that all afferent nerves—i.e. nerves in which the impulses travel towards and not away from the central nervous system—may influence the respiratory centre (see NERVOUS SYSTEM). But the vagi (nerves that are distributed to all the viscera) seem to be in specially close relation, beginning as they do close to the respiratory centre in the medulla, and ending in the lungs. If one vagus be cut there is not much effect upon the breathing; but if both are cut then the breathing becomes slower and deeper. If the end nearest the centre of one of them be stimulated the respiratory rhythm is *generally quickened;* by a certain strength of stimulus it may be made normal; if the strength of the stimulus be further increased the inspiratory movements may be made before expiration is finished; this effect increased to a certain extent must obviously result in a standstill of all respiratory movements; the chest-walls remain in the inspiratory place. But *occasionally* it happens that stimulation of the central end of a vagus, after both have been cut, produces a further *slowing* of the movements—they may indeed be entirely stopped; in this case the chest-walls remain in the expiratory phase. From these results it is concluded that the vagus contains two kinds of fibres that affect the respiratory centre, one kind that increases the respiratory movements, another that inhibits them; and, further, that when one kind is active in causing increased inspiratory movements the other kind is active in causing depressed expiratory movements. Further, if air be drawn out of the lungs, thus imitating expiration, an inspiratory effort is made; if air be forced into the lungs, thus imitating an inspiratory movement, an expiratory effort is made. Therefore we may conclude that expiration stimulates the inspiratory centre, and that inspiration stimulates the expiratory centre. That the effects from which these conclusions are drawn are due to the stimulation of the vagus endings in the lungs is shown by the fact that they do not occur when the vagi have been divided; and that they are not due to alteration in the state of the essential gases of the blood is shown by the fact that they may be produced by forcing an indifferent gas, such as nitrogen, in and out of the lungs. The respiratory pump is therefore a self-regulating mechanism.

If we cut the vagi the respiratory rhythm usually becomes slower, and the movements are deeper;

therefore normally stimuli are constantly passing up the vagi to the centre, and accelerating the discharge of impulses by the centre. Still, an accelerating effect is not the same thing as an initiating stimulus. Further, since respiration goes on when the higher parts of the brain are removed, impulses proceeding from above are not essential; and since when the spinal cord is cut below the medulla the movements of the nostrils and vocal chords continue (although of course all others cease), the centre works independently of sensory impulses arriving from any nerve, except the cranial nerves; and since these cranial nerves may be divided, if the medulla and spinal cord be left intact, without any effect upon the respiratory movements, we may conclude that the centre is automatic in its action, but may be influenced from without.

The more venous the blood the greater is the activity of the centre; when the blood reaches a certain state of impurity convulsions arise. We may conclude that the state of the blood affects the centre directly, and not reflexly, by stimulating the endings of afferent nerves in various parts of the body; because if the supply of blood be cut off from the medulla alone the same effects are produced. Venous blood differs from arterial blood in containing less oxygen and more carbonic acid. The deficiency of oxygen is the cause of the greater activity of the centre, because if an animal breathe an atmosphere of nitrogen the carbonic acid does not accumulate in the blood, and yet convulsions occur; whereas if the animal breathe an atmosphere containing sufficient oxygen but excess of carbonic acid, then the convulsions do not occur, but the animal may become unconscious through some of the higher centres being poisoned. When in action the centre discharges motor impulses down various nerves to all the muscles concerned in the respiratory movements. If any of the nerves be cut the movements of the muscles supplied of course cease, since they are no longer stimulated by impulses proceeding from the centre.

The Chemistry of Respiration.—We have now to explain the passage of oxygen from the air-chambers of the lungs into the blood that circulates in the vessels of the chamber-walls, and the passage of carbonic acid from the blood into the air within the lungs.

In order to understand what follows we shall have to study the laws of diffusion (see also DIFFUSION). A gas consists of a great number of separate molecules moving with great speed. The number of these molecules in a cubic inch of a gas (at ordinary temperature and pressure) is estimated about 10^{21} or 1,000,000,000,000,000,000,000. Each molecule is so small that the space between adjacent molecules is large compared with the size of the molecules; therefore, each molecule during its movement has a large path free from collision with other molecules. The average speed of a molecule varies with the temperature, increasing as the temperature rises. The molecules lying near the surface of any mass of gas will constantly impinge upon the boundaries; these impacts are so numerous and so close that they produce an apparently continuous *pressure* all over the boundary. This pressure obviously depends only upon the density (number of molecules in unit-space) and the temperature (average speed of the molecules) of the gas. Further, the molecules of a gas are so far apart that when two or more gases are mixed their molecules interfere so little with each other that each gas exerts the same pressure upon the walls of the containing vessel as it would do were it alone present. In such a case the total pressure is the sum of the two or more *partial pressures* of the several gases. If the space in which a gas is enclosed be diminished the molecules are brought nearer to each other, until a point is reached at which many of the molecules apparently act upon each other in such a way as to *become more complex molecules, thus forming a liquid* in the lower part of the vessel with its gas in the upper part. The complex molecules are still in motion, and interchange, or *diffusion*, constantly takes place between the two regions. The number of molecules leaving the gaseous region depends only upon the state (temperature and density) of the gas. The number leaving the liquid depends only upon the state (temperature and density) of the liquid. When the diffusion takes place in a closed space a state of equilibrium of interchange is soon reached. In the lungs the liquid molecules of the oxygen of the blood are being constantly moved past the common surface between the air and the blood; the inflow therefore of oxygen from the air into the blood is greater than the outflow from the blood to the air. On the other hand, the gaseous carbonic acid in the air is constantly removed from the common surface between it and the blood; and therefore the outflow of carbonic acid from the blood into the air is greater than the inflow from the air into the blood. This picture of the state of matters that regulate the interchange of gases in respiration is simpler than the reality. The further complexity will be described immediately.

We must know what are the laws governing the diffusion when the gas *above* the liquid is not the gas of the liquid, as is the case when air rests upon a surface of water. Some of the molecules of the air will become entangled in the liquid, will form the liquid of the particular gases *within* the other liquid, and then the state of affairs will be as before, so far as the gases, and their liquids, of the air are concerned, and a state of equilibrium between each of these gases and its own liquid will be formed. But now suppose that the liquid and the gas have a special chemical affinity for one another, as is the case with the oxygen of the air and a substance in the blood, and as is the case with the carbonic acid of the blood and a substance or substances in the blood. As soon as the gas has diffused into the liquid the chemical compound will be formed; but now the reverse effect will begin, dissociation of the compound will occur, but slowly, because a greater violence of collision is necessary. Therefore, other things being equal, less pressure will be needed to maintain equilibrium, because fewer liquid molecules of the compound will become gaseous, and therefore fewer gaseous molecules need become liquid to preserve equilibrium. Indeed, it is found that at a certain temperature and a certain pressure the dissociation scarcely takes place at all; but if temperature be raised, or if the pressure be lowered to a certain point, then the dissociation will be very rapid.

These laws of diffusion apply to the gases of the blood. In the investigation of these gases a sample of blood is placed under the receiver of an air-pump (thus imitating, though exaggerating, the normal pumping action of the chest-walls), the gases extracted are passed through various solutions which retain the several gases, and thus they may be estimated and examined. The quantity of oxygen obtained from arterial blood is greater than that obtained from venous blood. The arterial blood of a dog yields for every 100 vols. at ordinary pressure and 0° C. 58·3 vols. of mixed gases when the external pressure is reduced to zero. This mixture is composed of 23·2 vols. of oxygen, 34·3 vols. of carbonic acid, and 1·8 vols. of nitrogen.

If blood took up as much of these gases by mere diffusion as water does, it would contain 0·86 vols. of oxygen, 1·2 vols. of carbonic acid, and 1·6 vols. of nitrogen. Therefore it is evident that, while

the nitrogen is merely diffused into the blood, the oxygen and the carbonic acid must be combined with some substance or substances in the blood. If we gradually lower the external pressure of the atmosphere upon the blood we notice that at any given temperature (at which the combination can exist) the pressure may be lowered to a certain point without much gas coming off, and that at that point the gases begin to come off rapidly. This is another proof that the gases are combined and not merely absorbed in the blood; for in case of simple absorption the gases come off in equal amounts for equal lowerings of pressure. The amount of the gases that can be taken from blood-plasma (free from blood-cells) is 0·26 vols. of oxygen, 35·26 vols. of carbonic acid, and 2·24 vols. of nitrogen. The great mass of the oxygen is, therefore, not in the plasma, but in the corpuscles; while the great mass of the carbonic acid is in the plasma. The oxygen is found to be united to the red colouring matter, of which the red blood-cells are chiefly composed. This substance is called hæmoglobin. It is not so easy to determine in what combination the carbonic acid exists in the plasma. A certain amount is found in the red corpuscles (though the above figures do not show it); indeed, some writers consider that the hæmoglobin of these cells is the chief carrier of carbonic acid. The effect of lowered pressure upon blood-plasma, so far as regards carbonic acid, is much the same as it is upon solutions of sodium hydrogen carbonate. Some writers believe that the carbonic acid exists in the plasma in the form of sodium bicarbonate. Others believe that it may be in the form of bisodium hydrogen phosphate. The presence of red blood-corpuscles has a very marked effect upon the disengagement of carbonic acid under lowered pressure; it hastens it considerably. This effect appears to be due to the presence of oxyhæmoglobin.

The total pressure of the atmosphere is 760 mm. of mercury. The partial pressure of *oxygen* in the *air* is 159·6; of *carbonic acid*, practically zero; of *nitrogen*, 600·4. Oxygen does not leave arterial blood until the partial pressure falls to 29·64, nor venous blood until the pressure falls to 22·04; these therefore are the partial pressures of oxygen in arterial and venous blood. Carbonic acid does not leave arterial blood until the partial pressure falls to 21·18, and venous blood until it falls to 41·04. Therefore blood exposed to air would readily gain oxygen and lose carbonic acid. But the air in the part of the lungs where the respiratory interchange takes place is not the same as the air surrounding the body; the partial pressures of expired air will be nearer the true numbers; they are—of oxygen, 121·6; of carbonic acid, 33·4; of nitrogen, 600. But even expired air is not the same as air within the alveoli; for the air taken in and out of the lungs (tidal air) only enters and leaves the larger respiratory passages near the opening into the outer air; from these it diffuses into the air of the alveoli. The partial pressures of this air have been estimated by introducing a collector into the alveoli and taking out samples. Specimens of air collected in this way have been found to have the following partial pressures: Oxygen, 27·44; carbonic acid, 27·06; nitrogen, 705·5. It is difficult to believe that this is a correct estimate, for the difference between the partial pressure in the alveoli and that in the expired air is so enormous. However, assuming it to be correct, the following diagram will show the direction in which diffusion must take place.

	Venous Blood.	Alveolar Air.
Oxygen	22·04	27·44
Carbonic Acid	41·04	21·04

The vertical line represents the alveolar and capillary wall; the arrows show the direction in which the gas molecules must diffuse. But if we compare the partial pressures in venous blood, in arterial blood, and in alveolar air, a very remarkable fact appears.

	Alveolar Air.	Venous Blood.	Arterial Blood.
Oxygen	27·44	22·04	29·64
Carbonic Acid	27·06	41·04	21·04

The venous blood flows through the lungs, and issues as arterial blood, and yet the partial pressure of oxygen in arterial blood is *higher than it is in alveolar air, the place from which it must have come;* while the pressure of carbonic acid in arterial blood is *lower than it is in alveolar air, the place to which it has passed.* We must therefore conclude that the living alveolar wall has exercised some influence upon the gases in virtue of its secreting and excreting activity; it has done work against the molecular energies that produce diffusion. But the numbers given by various authors for the partial pressures of the gases in the various places differ, so that perhaps no thoroughly reliable conclusion can be drawn from them. Still in any case the slight differences of partial pressure, especially of oxygen, render the validity of any explanation of the rapidity of gaseous interchange within the lungs in terms of ordinary diffusion extremely doubtful. A possible aid to the interchange has recently been suggested in the sudden stroke of the heart, which would have an accelerating effect upon the liberation of gases from a fluid under low partial pressure; just as a tap upon the sides of a glass containing soda-water will cause bubbles of carbonic acid to be given off. Further, as already stated, some carbonic acid is combined with hæmoglobin. This combination is, like oxyhæmoglobin, dependent upon the partial pressure of the carbonic acid, and is easily given off when that pressure is lowered. Possibly the hæmoglobin may be an important carbonic acid carrier in the blood.

Effects on Respiration of the Quality and Quantity of the Gases of the Atmosphere.—The respiratory mechanism, as well as the whole body, is adapted to work with air of a certain composition, and at a certain pressure. The mechanism can adapt itself, within certain limits, to variations of composition and pressure. We have to state what these limits are, and what happens when they are overstepped. We shall study first of all, because of its practical importance, the results of breathing in a confined space, or in one insufficiently ventilated. The effect upon the air of course is that the proportion of oxygen is lowered, and that of carbonic acid increased. The first effect upon a person experiencing such a state of affairs is that a sense of mental and muscular fatigue occurs when the proportion of carbonic acid rises to 0·1 per cent., the normal proportion being 0·04 per cent.; and this is not due to the carbonic acid, but to the presence of organic matter, derived probably from the clothes, of the amount of which the carbonic acid happens to be a measure; for if pure carbonic acid be introduced into the air of a room, until the proportion rises to 1 per cent., no disagreeable sensations are experienced in breathing it. If the proportion of oxygen be still further diminished, or if by shutting the trachea of an animal all supply of oxygen to its blood be cut off, the oxygen of the blood begins to be used up, and carbonic acid begins to accumulate, and asphyxia sets in. There are three stages of asphyxia. (1) The breathing becomes deeper and more rapid, the blood-pressure rising at the same time. (2) The respiratory movements continue to increase in force and

rapidity, extra muscles are called into play, the expiratory movements are especially marked; then all the muscles that can possibly aid in expiration are used, the excitement spreads to nearly all the muscles of the body, and convulsions set in; these violent efforts exhaust the body. (3) A stage of quiet, due to exhaustion, occurs; a few long-drawn inspiratory gasps are made, these die out; the whole body is convulsively stretched out, and death intervenes. When the trachea of a dog is artificially closed these events run their course in from four to five minutes; the convulsions appear at the end of the first minute, and cease suddenly within the second minute. In drowning death is often hastened by the entrance of water into the lungs. The time at which death from drowning occurs varies with the state of the animal at the time of the occurrence. Young animals—e.g. a puppy—in which the respiratory changes are less active than in adults, may survive an immersion of fifty minutes; but a full-grown dog rarely recovers after having been 1½ minute under water. For man, see below, p. 667. By training, as in the case of divers, the respiratory centre may be accustomed to bear the scarcity of oxygen for much longer than it can normally.

We next consider the effects of changes in the partial pressures of the gases of the atmosphere, the total pressure remaining more or less unchanged. *Lessened* partial pressure of *oxygen*, as already noted, results in asphyxia. *Increased* partial pressure of *oxygen* results in the phenomenon known as *apnœa*. After several very deep inspirations the state known as *apnœa* occurs, and it is easy to hold the breath for a longer time than usual. The usual explanation of this has been that the oxygenation of the blood is so complete that there is enough to last some time, and the centre is not stimulated by its absence or by the presence of the reducing stuff in the blood. Later authorities regard the cessation of respiratory movements which occur when oxygen is rapidly forced into the lungs by rapidly succeeding respiratory movements as due to fatigue of the respiratory apparatus. *Increased* partial pressure of *carbonic acid* tends to the accumulation of carbonic acid in the blood, ultimately producing a state of narcosis without convulsions. *Decreased* partial pressure of *carbonic acid* results merely in the carbonic acid of the blood being able to leave the blood with greater readiness. Alterations in the partial pressure of nitrogen have no effect. *Ozone*, instead of making the blood more arterial, as one might expect, makes it more venous, and causes irritation of the respiratory passages. *Carbonic oxide* combines with the hæmoglobin with more avidity than oxygen; consequently it interferes with due respiration. *Sulphuretted hydrogen*, acting as a reducing agent, has ultimately the same effect. *Nitrous oxide* (laughing gas) produces narcosis, and is used as an anæsthetic. Some gases—*hydrogen*, *marsh-gas*, and other neutral gases—have no effect. Some—*chlorine*, *ammonia*, &c.—cause spasm of the glottis, and so cannot be breathed.

Another point to attend to is the effect of variations in external pressure, the proportional composition of the atmosphere remaining unchanged. Sudden and great diminution of pressure will cause fatal convulsions, due to the sudden liberation of bubbles of the gases of the blood within the vessels; these plug up the smaller vessels, and affect the working of the valves of the heart, and cause asphyxia. If the pressure be gradually *diminished*, as in ascending a mountain, no effect even at considerable heights is experienced beyond a feeling of 'distress' often accompanied by bleeding at the nose. This is due to a derangement of the vascular system, the walls being constructed to meet a certain external pressure. If only the respiratory interchange of gases were concerned, the total external pressure might be reduced from 760 mm. to 300 mm., corresponding to a partial pressure of oxygen of 76 mm., and to an altitude of 17,000 feet, before the combination of oxygen with hæmoglobin, at the temperature of the blood, would be seriously affected. In various parts of the world there are people living at an altitude of 11,000 feet. If the pressure be still further reduced asphyxia occurs, but it is not quite the same asphyxia as that which results from absence of oxygen; the characteristic convulsions are often absent, while a rapid onset of feebleness amounting almost to paralysis occurs. Increase of pressure up to a pressure of several atmospheres is followed only by symptoms of drowsiness, due probably to increased pressure upon the whole organism rather than to a direct derangement of respiration. At a pressure of fifteen atmospheres, which corresponds to a partial pressure of oxygen of three atmospheres, the animal dies of asphyxia with convulsions as though from a deficiency of oxygen. The production of carbonic acid is diminished with increase of pressure—i.e. the oxidations of the whole body are lessened. At a certain point these oxidations cease, and the animal dies. All living things are killed by a too great pressure of oxygen. The oxidations of some other substances—e.g. phosphorus—are analogous; at a certain pressure they will not burn.

The effect of variations in temperature must not be overlooked. By variations in temperature we mean of course variations in the temperature of the body and of the blood, and not merely variations in the temperature of the surrounding medium, for these have normally, in warm-blooded animals (the temperature of cold-blooded animals varies with that of the surrounding medium), no effect upon the temperature of the body, owing to the regulating mechanism afforded by the vessels of the skin and vaso-motor system (see CIRCULATION). The temperature of an Eskimo is nearly the same as that of an African; and in a Turkish bath the temperature only rises a very little. In cold-blooded animals the oxidative and chemical processes of the body decrease with a lowered temperature, and increase with increase of temperature; but the reverse is the case with warm-blooded animals, for the temperature of the body in an atmosphere of low temperature is partly kept up by increased oxidation; but in fever—i.e. when the temperature of the blood is actually raised—the chemical activity of the body of a warm-blooded animal rises. Such an animal dies when the temperature of its blood rises to 45° C. or 50° C., a mammal at 45° C., and a bird at 50° C. Death is due to the fact that when the temperature rises to this point the partial pressure of the oxygen of the air is no longer sufficient to maintain the combination of oxygen with hæmoglobin. Theoretically a higher temperature might be survived if the external partial pressure of oxygen were proportionally increased.

INNER OR TISSUE RESPIRATION.—We now come to the last and most interesting part of our subject—the manner in which the oxygen of the blood enters the tissues, the use made of this oxygen by the cells of the tissues finally resulting in the formation of carbonic acid, and the manner in which this carbonic acid leaves the tissues and enters the blood. The term 'inner respiration' is by some writers restricted to the interchange of the gases between the tissues and the blood; but it is usual and more convenient to include in that term what is known of the uses made of the gases by the cells. We have spoken with confidence of this respiratory action of all the cells of the

body, but we must not forget that it has not always been believed in, and even now is doubted by some. The original theory was that the oxygen was used, and the carbonic acid formed, in the lungs only. This was disproved when it was shown that there is more oxygen and less carbonic acid in the blood coming from the lungs than in that going to them. Next it was, and still is by some, thought that the oxidations take place within the blood; the cells of the tissues were imagined as pouring oxidisable matters into the blood. Usually very little matter capable of taking oxygen away from a loose combination can be found in the blood, but in that of asphyxiated animals more of such matter was found; this was explained by supposing that in asphyxia the oxidisable excreta from the cells accumulated in the blood through insufficiency of oxygen; but it has recently been shown that this reducing stuff only exists in the red blood-cells—i.e. in the reduced hæmoglobin—while lymph, which we might expect to find rich in such matters, it being into the lymph that most of the excreta of the cells are poured, is totally devoid of it. Lastly, the supposition that the cells of the tissues use the oxygen directly is so much in harmony with all our present ideas of animal physiology and with the facts of comparative respiration (one-celled animals breathe, and plants breathe, and in these there is no circulating blood) and of embryology (the embryo mammal breathes though its blood-vessels are not connected directly with those of its mother) that one is disposed to believe it without further proof.

The mode of interchange of gases between the blood and the tissues must be the same as that with which we are already familiar—viz. the diffusion from a place of high partial pressure to one of lower partial pressure. The fact that a low partial pressure of oxygen is constantly maintained within the tissues is one of the phenomena that constitute the mystery of life. We have already seen that even in outer respiration the living cells of the essential membrane of the lungs may apparently do work against partial pressure, absorbing more oxygen and excreting more carbonic acid than the differences of pressure will account for; it is therefore extremely probable that a similar state of activity is characteristic of the cells of the other tissues. Taking the more obvious facts first, we know that with any weight of body—i.e. with a given amount of tissue to be supplied with oxygen—the amount of oxygen taken in and of carbonic acid excreted varies with the activity of the organism and with the amount of work that it is doing; it is greater in youth than in old age, in wakefulness than in sleep, during the activity of secreting glands than when these are at rest, during the performance of muscular work than in repose; in this case it is the excretion of carbonic acid rather than the intake of oxygen which is especially marked. This last peculiarity brings us face to face with a remarkable state of affairs. The partial pressure of oxygen within muscular tissue is always practically zero—i.e. however low the external pressure of oxygen may be, none will leave the muscle. The effect of this of course will be, so far as ordinary diffusion is concerned, that oxygen will always be leaving the blood and entering the tissues. This oxygen is in some way stored up within the muscle-cells, so that a muscle will work for a considerable time without any fresh supplies of oxygen, even in an atmosphere of nitrogen. This explains the fact noted above, that during muscular work the excretion of carbonic acid is in excess of the absorption of oxygen. A supply of oxygen, however, is necessary for the maintenance of the *irritability* of the muscle, which soon falls off without it, probably before the supply of stored oxygen used for the performance of its *work* has been exhausted. This is about all that is known of the chemical changes connected with respiration within a cell. The oxygen enters it by diffusion, possibly aided by some vital activity; the rapid storing away of the oxygen and consequent readiness to absorb more is in reality an example of such activity; the oxygen is made use of within the cell for maintaining its life, for producing heat, for producing rapid decompositions which supply the energy of muscular contraction; finally the carbonic acid leaves the cell and enters the blood, possibly aided in this process by some process other than a simple diffusion. The respiratory changes of other tissues are probably similar to those of muscle; within them, within the lymph that bathes them, and within their secretions there is practically no free oxygen, while the pressure of carbonic acid, owing to its constant production within the cells, is greater within the cells, their secretions, and the lymph that bathes them than it is in venous blood.

There is another fact about respiration which is still a puzzling matter, and, since it results from the changes within the cells, is likely to remain so for some time. All the food of a meal, or its equivalent, is in about six hours oxidised into carbonic acid, water, and urea. This is obvious without any elaborate calculations from the fact that we may eat every six hours and yet not gain in weight, while, apart from the indigestible parts of the food, which do not affect the problem, the chief matters that leave the body are those mentioned above. Yet food-stuffs outside the body are not affected by oxygen at the temperature of the body. Various suggestions as to the possible reason for this have been made; but, since the phenomenon is obviously dependent upon the vital processes of cells, suggestions in terms of the principles of ordinary chemistry cannot carry us far.

Further information regarding respiration will be found in the last editions of the text-books of physiology recommended at the end of the article upon that subject. The diseases of the respiratory organs are dealt with in separate articles, BRONCHITIS, CONSUMPTION, PLEURISY, PNEUMONIA, TUBERCLE, &c.

Historical.—Aristotle (384 B.C.) thought that the object of respiration was to cool the body. He observed that the warmer the animal the more rapid the breathing, and transposed cause and effect. Galen (131 203 A.D.) experimented upon the mechanics of respiration, and knew something of the nervous mechanism. He believed that 'soot' and water were excreted from the body by the lungs. Malpighi (1661) described the structure of the lungs. Van Helmont (1664) discovered carbonic acid; Black (1757) observed that carbonic acid is breathed out of the body. Priestley (1774) discovered oxygen. Lavoisier (1775) discovered nitrogen, found the composition of the air, and taught that the formation of carbonic acid and water resulted from the combustion that took place in the lungs. Vogel proved the existence of carbonic acid in the venous blood; Hoffmann found oxygen in arterial blood. Magnus extracted and analysed the gases of the blood in both states.

Comparative.—Most of the Protozoa, all the sponges and stinging animals, and many simple worm-types live in water, which washes their surface and saturates their substance, the oxygen dissolved in the water serving the same purpose as that mixed with the air. While many worms breathe simply through their skin, many of the aquatic forms have structures specialised for respiration—modifications of the legs or tentacles or vascular outgrowths of the body-wall. In Echinoderms respiration is effected by the tube-feet, and

sometimes by hollow 'skin-gills' as well. The crustaceans usually breathe by gills or through the skin; in Peripatus, Myriopods, and insects air-tubes or tracheæ ramify throughout the body. Scorpions have plaited sacs or 'lung-books,' which many regard as modifications of tracheæ; and these are developed in spiders also, with or, rarely, without the addition of ordinary air-tubes. The king-crab has a unique arrangement, consisting of plaited sacs or 'gill-books,' adapted for breathing in water. Some molluscs breathe simply by the skin, others have external gills, most have gills sheltered by the mantle, and air-breathing forms like snails have a mantle-cavity which serves as a lung. In Balanoglossus there are numerous respiratory clefts opening from the pharynx to the exterior; Appendicularia and young Tunicates have a pair of these; in adult Tunicates the primitive clefts are replaced by numerous secondary slits on the wall of the pharynx, through which water drawn in by the mouth passes into an atrial or peribranchial chamber and thence to the exterior; the same is true of Amphioxus. Clefts from the wall of the pharynx to the exterior are, indeed, characteristic of vertebrates, but beyond amphibians they are transitory embryonic structures, never used for breathing. This loss of functional gill-clefts is associated partly with the development of an embryonic birth-robe known as the allantois, which secures the aeration of the embryo's blood, and partly with the transition from aquatic to terrestrial life. In the hagfish the nasal sac opens into the mouth; in fishes this is only true of the double-breathing Dipnoi; in all other vertebrates air passes through the nostrils in and out of the mouth and lungs. In the hag and lamprey there are purse-like gill-pockets, and the respiratory arrangements are otherwise peculiar. In fishes gill-filaments are borne on the skeletal arches separating the gill-clefts, and the blood-vessels spread out on the filaments are washed by currents of water. Young Elasmobranchs have at first external gills and afterwards the internal gills characteristic of all fishes. The Dipnoi have gills, but they also come to the surface and gulp air, using their air-bladder as a lung, and thus pointing the way to amphibians. For, while almost all amphibians have gills in their youth, all the adults are lung-breathers, though some retain their gills as well. Among higher vertebrates there are many peculiarities, such as the single lung of most serpents, the balloon-like air-sacs around the lungs of birds, and the adaptations of cetaceans as aquatic lung-breathers, but the essential characteristics of pulmonary respiration are the same in all. The hæmoglobin, so important in respiration, occurs first in Nemerteans, and is present in some other worms, some Echinoderms, a few Arthropods, some molluscs, and in all vertebrates except the Tunicates, Amphioxus, and a few exceptional fishes. But though hæmoglobin is not present in most invertebrates, analogous pigments are common, especially one called hæmocyanin, which turns bluish when oxidised.

ARTIFICIAL RESPIRATION.—When death is imminent owing to a cessation of the natural respiration movements, it may sometimes be averted by an imitation of them carried on regularly for some time. Such a condition may occur in disease (e.g. asthma, epilepsy), though very rarely; it is most common in suffocation, either by drowning, choking, or strangulation, and is sometimes met with also in poisoning by noxious vapours (e.g. carbonic acid, carbonic oxide, coal-gas, chloroform, &c.). In order that any method may have a chance of being successful it is of course necessary that the entrance of air into the lungs be not impeded, either by a piece of food or by water in the windpipe, or by the tongue falling back and closing the upper opening. A piece of food may sometimes be removed through the mouth by the finger; if this fails the windpipe should be opened (see TRACHEOTOMY). In those apparently drowned the body should first be laid on the face, with the head low, and the thorax and abdomen pressed upon in order to expel fluids which may have been drawn into the trachea and bronchial tubes. The tongue may need to be held forward; this may be done by an assistant, or an elastic band passed round the tongue and the chin will effect the object.

Numerous different methods have been devised for effecting the objects aimed at, and no general

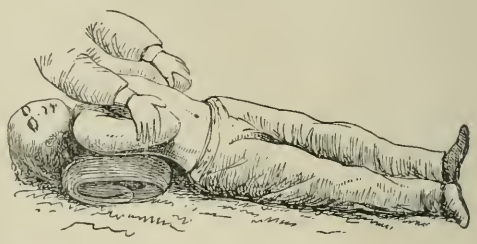


Fig. 1.

consensus of opinion has yet been arrived at as to which is the best. The methods fall into three divisions: (1) insufflation, or blowing of air into the lungs, either by the mouth or by means of bellows; (2) manual methods, in which external manipulations of the chest-walls are made to effect the entrance and exit of air; (3) electrical stimulation of the respiratory muscles. In all cases where artificial respiration is required every moment is of importance. It is doubtful whether life can ever be restored when the heart has ceased to beat for more than a few seconds; and when breathing has stopped failure of the heart's action is always imminent. That method is therefore best which can be applied with the least possible loss of time, so that under ordinary circumstances the methods which require bellows or electric batteries are out of the question. Direct insufflation, or blowing of air into the patient's lungs by the mouth applied to his mouth, is now hardly ever used except in the case of very young children. Of the manual methods those most in use

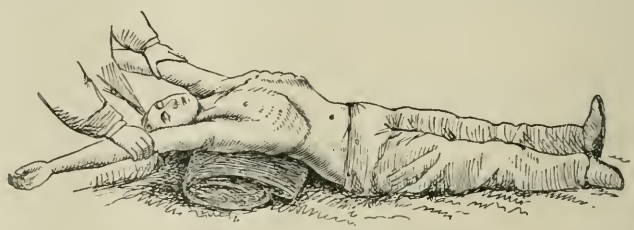

Fig. 2.

are Marshall Hall's (1856), Silvester's (1857), and Howard's (1877). The second is certainly the most easy to learn, but is more fatiguing to carry out for a length of time than either of the others. In Marshall Hall's method the body is laid upon its face and rolled 'in what may be termed cradle fashion' from this position on to one side and a little beyond it (inspiration), and then back on to the face (expiration). In Silvester's method the

patient is laid on his back on a plane, inclined a little from the feet upwards, and the shoulders are gently raised by a firm cushion placed under them, which also throws the head back. The operator then grasps the patient's arms just above the elbows, and raises them till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down, and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated. In Howard's method the patient is laid on his back with a cushion below the middle. The operator kneels astride his hips, places his hands with fingers spread outwards over the lower part of the chest-wall, and alternately bends forward, throwing his weight on the chest to imitate expiration, and springs back to allow the elastic recoil of the chest-wall to imitate inspiration.

Whatever method be adopted, the movements must be gently, regularly, and perseveringly carried on, at the rate of from ten to fifteen times in the minute; and when the faintest natural effort at respiration is observed they must at once be timed so as to reinforce and not to oppose it. In some cases life has been restored under artificial respiration when no respiratory movements have occurred for an hour or even several hours. In all cases, but especially in that of persons apparently drowned, artificial respiration should be conducted in a warm atmosphere, 90° F., or even more if possible, and should be supplemented by warmth applied to the body and by vigorous friction. In those apparently drowned recovery is very rare after complete immersion for five minutes or more. If stunning or fainting has occurred at the moment of immersion, so that the respiratory movements have been annulled or much diminished for the time, less water will have entered the lungs, and the chance of recovery may be greater. In other modes of death by suffocation, such as choking or strangulation, the action of the heart may continue longer, and restoration to life be therefore possible after a longer deprivation of air.

See the publications of the Royal Humane Society and Royal National Lifeboat Institution; various handbooks on ambulance work. A résumé and discussion of the various methods is given by Dr B. W. Richardson in the *Asclepiad* for 1890, p. 201.

Respirators are worn over the mouth (oral) or mouth and nose (ori-nasal) for changing the properties of the air inspired. The name was first given by Mr Jeffreys to an apparatus he contrived about 1835 for the purpose of warming the air, formed of numerous layers of fine perforated metal with wire soldered to them. Their value in diminishing the risk of catching cold, which in many cases is undoubted, probably depends at least in part on their affording protection to a sensitive portion of the skin; they act, in fact, as an additional article of clothing. But they are of most value to those who are not able to breathe through the nose in the natural way. Respirators have been largely used of late years in diseases of the nose, throat, lungs, &c. for impregnating the inspired air with medicated vapours; for this purpose they are constructed with a chamber containing a sponge or cotton-wool which is kept charged with the substance whose action is desired (carbolic acid, creasote, eucalyptus, or pine-oil, &c.). Respirators have been also devised for freeing the inspired air of impurities—e.g. in the case of firemen, who have to go into an atmosphere strongly charged with smoke; of needle-grinders and others whose work gives rise to much irritating dust; of those who are exposed to foul gases, &c. See FILTER.

Respite, a temporary delay of the execution of a criminal. See REPRIEVE.

Respondentia is a loan raised by the master of a ship, when he has no other means of doing so, upon security of the cargo or goods on board the ship. The contract has reference to a particular voyage, and the conditions are that if the subject on which the money is advanced be lost by sea, risk, or superior force of the enemy the lender shall lose his money; and that if the goods arrive in safety the loan shall be repaid with a greater than ordinary rate of interest, called marine interest. When the ship herself is hypothecated the contract is called Bottomry (q.v.). As a matter of fact the term respondentia is now seldom used, and generally the expression bottomry is employed whether the vessel or her cargo or both be the security.

Responsibility. See INSANITY, INFANT, HUSBAND AND WIFE, EVIDENCE, CAPACITY (LEGAL), LIABILITY.

Responsions. See OXFORD.

Rest-harrow (*Ononis*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, having a 5-cleft bell-shaped calyx, the standard of the corolla large and striated, the keel beaked, the pod turgid and few-seeded. There are many species, chiefly natives of Europe, and generally herbaceous or half-shrubby. The Common Rest-harrow (*O. arvensis*) is abundant in pastures and by waysides in Britain. Its lower leaves have three leaflets, the upper are simple; the flowers are axillary and rose-coloured, or occasionally white. The plant is half-shrubby, with somewhat spiny stems; viscid; and its smell strong and unpleasant. The roots are tough and woody, whence its English name. It is sometimes a troublesome weed, but only in neglected pastures, and disappears before careful cultivation.

Restiaceæ, a natural order of plants, nearly allied to Cyperaceæ, mostly natives of the southern hemisphere, and abounding at the Cape of Good Hope and in Australia. They are herbaceous plants, or sometimes half-shrubby, have simple stems and narrow leaves, and are hard, wiry, and rush-like. They have generally a creeping root-stock.

Restigouche, a river of Canada, rises in eastern Quebec, flows south-east into New Brunswick, then east and north-east into the Bay of Chaleurs, forming part of the boundary between the two provinces. Its length is about 200 miles.

Restoration, the resumption of monarchical government on the return of Charles II. to his kingdom, May 29, 1660. A form of prayer for that day was annexed to the Common Prayer-book from then until 1859; and, in commemoration of Boscobel (q.v.), 'Oak-apple Day' was long also celebrated by the displaying and wearing of branches and sprigs of oak, with gilded oak-apples.

Restoration, in its true sense, means bringing back or replacing what has gone; but of late years the word has come to have a new meaning. Restoration now means making new imitative work to take the place of decayed or fractured work, and in this sense it applies to pictures, sculpture, furniture, and architecture; but as applied to architecture it is allowed a still wider meaning—viz. the building up anew and with new materials portions of buildings which have ceased to exist, such new work being designed afresh in imitation of what was supposed once to have existed. The new meaning of the word restoration only applies to works of art, including all the decorative arts. The 'restoration' of pictures and sculptures has long ago been condemned as diminishing the value of such works of art. For instance, at the British Museum and other public galleries it used to be the custom to employ a sculptor to

'restore' antique statues by making new arms, legs, or noses, or even heads, to replace such features as were missing; and, although sculptors of note were employed to do this, it was eventually decided that the results were not satisfactory. The truth is that up to that time it had not been understood that a work of art is the creation of an individual—his rendering of an idea—and that another artist, even if living at the same time and in the same mental atmosphere, would hardly grasp that idea so completely as to be able to supply a portion of the work if missing, and much less could one living hundreds of years afterwards be successful in so supplying the missing portion.

It is, however, with reference to building that restoration in this new meaning is chiefly concerned. Roughly speaking, by the end of the 17th century all appreciation of the artistic qualities of our mediæval buildings had ceased, the art had died out, and given place to the Renaissance (q.v.) style of architecture. But about the middle of the 18th century the artistic qualities of mediæval architecture began slowly again to obtain a hold upon the people. It seemed to be looked upon as quaint and romantic, and strange rude imitations of it were made, such as Strawberry Hill, which was built by Horace Walpole. Such work is now generally described as 'Carpenter's Gothic,' perhaps because the restorers often put in wood-framed windows with pointed arches in feeble imitation of mediæval work.

The first attempts to reproduce Gothic work followed upon the decay of the Renaissance style of architecture, and constituted the germ of the modern restoration movement, or Gothic Revival, as it is generally called. This movement began to work actively about the beginning of the 19th century, and was largely accelerated by a revival of activity in the Established Church of England. An impulse was given to the restoration movement by a society called the Camden Society, and afterwards the Ecclesiological Society, which was composed of churchmen and clergy, and started at Cambridge in the year 1840. The members of this society studied the history and usages of the church before the Reformation, and by that means found out why our mediæval churches were constructed in the form in which they have come down to us, and what was the use to which their furniture, such as rood-screens and rood-lofts, sedilia, piscina, credence tables, aumbries, and the like, was put. Before the formation of this society men had already studied mediæval architecture, and had recognised that there are five distinct styles following one upon the other—viz. Saxon work, Norman work, Early English, Decorated, and Perpendicular work (see ARCHITECTURE, GOTHIC ARCHITECTURE). This classification was first made by Thomas Rickman, and these terms which he gave have been adhered to. Our mediæval churches are generally composed of two or three and sometimes of all the styles; but the modern Gothic revivalists desired, and in many cases still desire, to see the buildings complete in one style, and consequently, if an ancient building is composed chiefly of one style, they would destroy all the subsequent work and replace it by work designed in the same style. The subsequent work thus destroyed is generally spoken of as 'debased' work.

Under the influence of the Camden Society the Perpendicular clerestory and flat roof were taken off the Round Church at Cambridge, and the present high-pitched roof, which was thought to be more correct, was put on. Each one of the styles was in fashion in its turn, strangely enough, each becoming fashionable in the order in which they were naturally developed. As might be expected, the movement produced specialists, of whom Sir Gilbert Scott was the most noted. Into his hands was placed nearly every cathedral church in England, as well as a countless number of parish churches; however, he did but follow in the steps of the elder Pugin. Long before his death a cry of discontent arose. Even those who had felt that it might be possible to imitate the mediæval work accurately, so as to replace missing features, saw that this was a hopeless task, for not a single successful example of 'restoration' could be pointed to. Ruskin wrote strongly against 'restoration,' urging the folly of attempting to reproduce a lost work of art or any portion of it, and giving it as his opinion that the only right method of treating our ancient buildings—such indeed as had not been destroyed by 'restoration'—was to repair them structurally by propping leaning walls and mending leaky roofs. His words did but sound the note which was in the minds of many, and in 1877 a society was formed in London calling itself the Society for the Protection of Ancient Buildings, and having among its members men of all professions, including the clergy. This society has done its best to point out to those who still believe in the possibility of 'restoration' the destructive character of such work—destructive both of works of art and historical evidences—and it has urged the importance of keeping our ancient buildings in thorough and constant repair so as to avoid the necessity of wholesale renewal or rebuilding. The society also urges that no purely ornamental feature should ever be renewed any more than the antique statue should have its missing features replaced, and that where new features have of necessity to be introduced every effort should be made to keep them harmonious with, but dissimilar from, the ancient work. As examples of 'restoration' works we may give the north transept of Westminster Abbey and the west side of Westminster Hall, nearly the whole of St Alban's Abbey, the west front of Salisbury Cathedral (where an attempt has even been made to produce mediæval sculpture), Chester Cathedral, Worcester Cathedral; and, in fact, not a cathedral remains in England that does not bear marks of the movement. As has been shown, the 'restoration' movement had its origin in England, it has met a check, and shows signs of dying out; although it has spread to Scotland, the Continent, and even to India. Fortunately government has put a check upon it there, and we may hope that restoration as understood by the school of Sir Gilbert Scott is now ancient history.

Restoration of Pictures. The restoration and the cleaning of pictures may be considered together: though cleaning, of course, more strictly applies to the removal from their surface of the accretions of dust or discoloured varnish which obscure their beauties, while restoration refers to the reparation of actual flaws in their surfaces of paint, or in the canvas or wood upon which the paint is laid. When a mastic varnish has been used by the painter, and has become discoloured and opaque, it may be removed by careful and gentle friction with the points of the fingers, previously covered with a resinous powder, which frays off particles of the hardened coating in the form of a fine white dust. When copal varnish has been applied, its removal is more difficult and dangerous, and is usually effected by an application of weak alcohol, spirits of turpentine, and oil. A pad of cotton wool is saturated in this mixture, and passed over the surface of the varnish, which it dissolves and removes; a similar pad steeped in pure oil being applied at intervals to stop the action of the spirit when it threatens to disturb the colour beneath the varnish. When portions of the paint or of the ground of priming on which it has been laid have been removed,

these are sometimes filled up to the level of the remaining portions with glue, size, and chalk, and then carefully repainted with dry colour to match the surrounding portions of the surface.

The injuries of time to the various materials upon which colours are laid are very various, and require careful and skilful treatment. In panel pictures worm-holes must be carefully filled up with the last-named composition, and matched with the adjacent portion as just described. If the wood has split, its edges must be carefully brought together, and fastened securely with 'buttons' of hard wood; or the entire back may be protected with a kind of grating of mahogany spars, so adjusted as to admit of a slight contraction and expansion of the panel in varying temperatures. If the panel be too far gone to admit of this treatment, the wood is carefully removed by tenon-saws, planes, and files, till only the surface of priming and colour remains, which can then be remounted on canvas or a fresh panel. If the picture is on canvas which has become decayed, it may be 'relined' by having its back securely fastened, by paste or glue, to a new canvas, and afterwards ironed, a process which has the effect of restoring evenness to a cracked surface of paint; though if the artist has worked with a thick impasto the raised points of colour are apt to become flattened, and the character of the handling to be slightly altered. When a fresco has to be removed from a wall this is usually effected by pasting its surface on paper, and then with a chisel slowly detaching the mortar which bears the colour from the stones upon which it has been laid, each portion, as it is gradually withdrawn, being coiled on a large cylinder. All the operations to which we have referred require extreme caution and great practice for their successful accomplishment. When they are entrusted to careless and untrained hands damage is certain, and it is impossible to estimate the immense amount of injury to works of art that has been effected by ignorant picture-restorers. Proper care of a picture, however, and preservation from damp and dust, will obviate the necessity for its being subjected to restoration; and such protection may be most simply effected by carefully closing in its back, and by covering its surface with glass, which answers all, and more than all, the preservative purpose of varnish, with the additional advantage that it does not chill and discolour with time. Glass is being largely adopted in the great public galleries, for covering even oil-pictures, and it has only one disadvantage—its tendency to reflect the objects placed opposite it, and so to interfere with the ready and complete examination, as a connected whole, of the entire surface of a large, and especially of a dark, painting.

Restorationists, a general name for those who hold the belief in a general *apocatastasis*, or 'restoration' of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men would be restored to the favour of God. The title itself is especially associated with a body of Universalists which flourished at Boston, U.S., in the first half of the 19th century; but for the doctrine, see the article HELL, Vol. V. p. 631, and the articles APOCATASTASIS, and UNIVERSALISTS.

Resurrection. This expression denotes the revival of the human body in a future state after it has been consigned to the grave. We find traces of this doctrine in other religions, in Zoroastrianism, and especially in later Judaism, but the doctrine is peculiarly Christian. In the earlier Hebrew Scriptures there is no mention of it. It is not to be found in the Pentateuch, in the Psalms, nor even in the earlier prophecies. It is supposed to be alluded to in Isaiah (xxvi. 19), and in Ezekiel (xxxvii.) in the well-known chapter as to the revival of dry bones in the valley of vision; and in the last chapter of Daniel (xii. 2) there is the distinct affirmation that 'many that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt.' There is also a well-known passage in Job (xix. 25-27) which was long thought to refer to the doctrine of the resurrection of the body; but all recent criticism denies the validity of this reference. It is therefore not till the later Judaism that the doctrine appears, and it is sometimes said, doubtfully, to have been derived from Persia or elsewhere. In the time of our Lord it had become a formal doctrine of the Pharisees. The general body of the Jewish people seem also to have believed in it; the Sadducees alone disputed it. It appears, in fact, to have become bound up in the Jewish mind with the idea of a future life, so that an argument which proved the one proved the other. It should be added that Mohammedanism (q.v.) cherishes gross beliefs on this head.

It remained for Christ and His apostles to reveal clearly the doctrine of the resurrection of the body, and to connect it with the fact of Christ's own resurrection as its special evidence and pledge. The following may be stated as the main points involved in the doctrine as revealed in the New Testament: (1) The resurrection of the dead is ascribed to Christ Himself; it will complete His work of redemption for the human race (John v. 21; 1 Cor. xv. 22 *sq.*; 1 Thess. iv. 14; Rev. i. 18). (2) All the dead will be raised indiscriminately to receive judgment according to their works, 'they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation' (John v. 21-29; 1 Cor. xv. 22; Rev. xx. 11). (3) The resurrection will take place at 'the last day,' by which seems to be meant the close of the present world (John vi. 39, 40, xi. 24; 1 Thess. iv. 15). (4) The great event is represented as being ushered in by the sound of a trumpet, a representation probably borrowed from the Jewish practice of convening assemblies by sound of trumpet (1 Cor. xv. 52; 1 Thess. iv. 16). (5) As to the character of the change through which our bodies are raised after the lapse of ages, and yet retain their identity preserved, there is nothing distinctly made known. The possibility of such a change was evidently a subject of argument in the primitive Christian age, and the apostle argues strongly in its favour (1 Cor. xv. 32 *sq.*) from occurrences which are scarcely less mysterious in the natural world.

The Gnostics denied the resurrection of the body, and made the change a purely spiritual one. The Catholic belief was greatly developed by Tertullian, Jerome, and Augustine, who, however, insisted that the resurrection body, though identical with the original one, is a glorified body. A third view, represented in ancient times by Origen, and recently by Rothe, affirms that the spirit must always have a bodily organism, and that the perfected personality necessarily assumes a spiritualised embodiment; in this view resurrection is limited to perfected spirits.

See the articles IMMORTALITY, CONDITIONAL IMMORTALITY; also those on HEAVEN and HELL. There is a full bibliography in Alger's *History of the Doctrine of the Future Life* (Phila. 1864); and see the Excursus in Godet's Commentary on St John; Westcott's *Gospel of the Resurrection* (1866; 5th ed. 1884); and Macan's essay on the *Resurrection of Jesus Christ* (1877).

Resurrectionists, or BODY-SNATCHERS, the names popularly given to those who made it their business to dig corpses out of their graves and sell

them as 'subjects' to lecturers on anatomy. Gradual progress in the science of anatomy led to its more thorough study by greatly increased numbers of medical students: and from about the middle of the 18th century professors of anatomy found that the supply of subjects, heretofore mainly obtained from the bodies of executed criminals, was altogether inadequate to meet the wants of the surgical and medical schools. The resurrectionists invented a new profession to supply the lack, and in the first quarter of the 19th century drove a most flourishing trade—the graveyards in the outlying parts of London being especially the happy hunting-grounds of the confraternity. As the business became organised, grave-diggers and sextons were bribed to leave graveyards unlocked and keep out of the way when a body was being raised. A very short time, usually at dead of night, sufficed; an expert pair of resurrectionists being able in about forty-five minutes to prise up the coffin out of a newly-made grave by means of a peculiar crowbar for the purpose, to burst in the lid, and remove the corpse. Corpses resurrected after this fashion seem to have been worth £8 or £10—offering large profits and quick returns to this precarious and risky trade. The body-snatchers carefully replaced the clothing in the coffin; the stealing of the naked corpse being by the law of England a misdemeanour only, whereas the removal of the clothes was of course a felony, punishable by transportation. So notorious did the practice of resurrectionism become that in many parts of the country painful precautions against it were regularly taken. Heavy gratings were securely fixed over new-made graves, spring-guns were set, and often the relatives of deceased persons sat armed by their graves night after night until it was assumed that the corpses would be no longer serviceable to 'the doctors'—a custom that survived in some places till far on in the century. Guard-houses or towers were sometimes built for the accommodation of the watchers. To the popular horror of this degraded calling, recruited from the worst classes, was added a strong suspicion that resurrectionists would on occasion manufacture corpses—a suspicion confirmed in the notorious case of Burke and Hare (see BURKE, WILLIAM). The passing of the Anatomy Acts of 1832 and 1871 rendered the lucrative trade of the resurrectionist superfluous; but in out-of-the-way places there are still traces of the old terror of body-snatchers supposed to drive out silently at nights in gigs with india-rubber tires, the horses being also shod with india-rubber, and the occupants of the gig provided with pitch-plasters to clap on the mouths of any likely victims. Single instances of a special kind of resurrectionism have occurred more recently; it is practised expressly with the hope of obtaining a reward from the relatives of the person whose body is stolen. Thus, the American millionaire, A. T. Stewart, died in April 1876, and was embalmed and duly buried in a triple coffin in the family vault in a New York graveyard; two and a half years afterwards the body was removed, and a reward of $25,000 was offered by advertisement for its restoration. The body-snatchers, represented by a regular practising lawyer, demanded $200,000, then $100,000, and after three years restored the body on payment of $20,000. The body of the Earl of Crawford, who died at Florence in December 1880, was removed from the mausoleum at Dunecht, near Aberdeen, a year afterwards; the body was found in a wood close by in July 1882, and the malefactor condemned to five years' penal servitude.

See Lonsdale's *Life of Dr R. Knox* (1870); Mrs H. B. Rodger, *The Aberdeen Doctors* (1893); and J. Blake Bailey, *The Diary of a Resurrectionist* (1896).

Retainer is, in English law, the act of engaging an attorney or counsel to attend to a certain suit or case. The retainer of an attorney may be either verbal or in writing; but the retainer of counsel is usually by written memorandum handed to his clerk, together with a small retaining fee. A general retainer is given by a party who wishes to secure the services of counsel in all actions brought by or against him. The term retainer is also used to denote the right of an executor to retain a debt due to himself from his testator's estate.

Retford, EAST, a market-town of Nottinghamshire, on the right bank of the Idle, an affluent of the Trent, 24 miles E. by S. of Sheffield and 138 NNW. of London by the Great Northern Railway. It has a handsome town-hall (1867), a grammar-school (1552; rebuilt 1858), paper-mills, iron-foundries, &c. It was first formally incorporated by James I., the municipal boundary being extended in 1878. The parliamentary borough was extended in 1829 to take in the whole wapentake of Bassetlaw—since 1885 one of the four county divisions. Pop. of municipal borough (1851) 2943; (1881) 9748; (1891) 10,603. See Piercy's *History of Retford* (1828).

Rethel, a town of France (dept. Ardennes), prettily situated on the right bank of the Aisne, 24 miles NE. of Rheims, has woollen and other manufactures. Pop. 7377.

Retimo (*Rhithymnos*), a seaport of Crete, on its north coast, 40 miles W. of Candia; pop. 8000.

Retinospora. See CYPRESS.

Retirement of officers from the British army is governed by royal warrants issued from time to time. The rules of 1889 permit officers to retire voluntarily with gratuities or pensions, and oblige them to retire at certain ages, or after a period of non-employment, on half-pay. Voluntary retirement on a gratuity of £1200 is allowed to officers other than those of the Coast Brigade Royal Artillery, Coast Battalion Royal Engineers, Royal Malta Fencible Artillery, Riding-masters and Quartermasters (q.v.), after twelve years' service, and to others on a pension according to rank and service. With certain modifications, the maximum rates are captains, £150 a year; majors, £250; lieutenant-colonels, £450. The age for compulsory retirement is forty-five for captains and officers of lower rank, with the exceptions named above, forty-eight for majors, fifty-five for lieutenant-colonels and colonels, sixty-two for major-generals, and sixty-seven for lieutenant-generals and generals. Non-employment for five years in any rank also entails retirement. Officers of the Indian Staff Corps and captains of the Royal Engineers do not come under these rules. The pensions granted in cases of retirement for age are, generally speaking, £50 more than those cited above, but for the three ranks of general officers they are £600 to £700, £750 to £850, and £900 to £1000 according to age.

Certain additions, generally in the form of gratuities, are allowed to purchase officers and officers of the late East India Company's Artillery and Engineers, in consideration of their altered prospects. The pensions of officers of the Indian Staff Corps are subject to regulations laid down from time to time by the Secretary of State for India. They are considerably larger in amount than those granted to the other branches of the service, and are affected by numerous rules as to furlough, length of service in India, &c., but no pension can be earned by less than twenty years' service.

Officers of the Coast Brigade Royal Artillery and

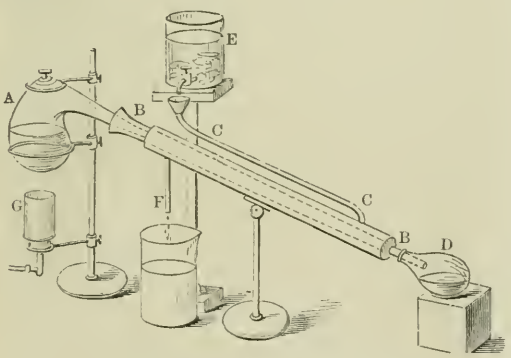
Coast Battalion Royal Engineers, inspectors of army schools, riding-masters, and quartermasters can earn a maximum pension of £200 a year, or the two first-mentioned classes if retired for age (fifty-five years) may receive the full pay of their rank. For the Royal Malta Fencible Artillery the maximum rates of retired pay are captains, £200 a year; majors, £300; lieutenant-colonels or colonels, £365.

Departmental officers receive retired pay at rates corresponding to those granted to other officers and on similar conditions as to age. Some of the highest rates are chaplain-general, £600; commissary-general, £800; director-general, Medical Staff, £1125.

The army estimates for 1891–92 provide for a total of £1,853,632 on account of retired pay and gratuities (£1,543,950), half-pay (£75,550), allowances to widows, &c. (£164,563), rewards for distinguished services (£12,400), pensions for wounds (£15,200) for officers; for warrant officers and non-commissioned officers, £1,856,207. In 1898–99 the corresponding figures were £1,938,206 for officers, and £1,802,335 for warrant officers, &c.

In the navy officers are placed on the retired list at sixty-five years of age if admirals or vice-admirals, sixty for rear-admirals, fifty-five for captains, fifty for commanders, and forty-five for lieutenants, with the option in each case of retiring five years earlier. Lieutenants and commanders are also retired compulsorily if they have not served for five years afloat, captains after seven years without service, and flag-officers after ten years. In 1891–98 there were some 2500 naval and marine officers on the retired list, costing about £760,000 a year. See Pensions, Discharge.

Retort, a vessel employed by chemists for the purpose of distilling or effecting decomposition by the aid of heat. It may be made of glass, earthenware, or metal, according to the purposes for which it is to be employed. Glass retorts are the most common, and their ordinary form is seen in the figure. They may be employed for the production



Retort fitted with Liebig's Condenser:

A, bulb of the retort, into which the liquid to be distilled is put; D, the receiver, into which the end of the retort is placed; BB, the condenser, receiving a supply of cold water from E by means of the pipe C, the heated water escaping at F; G, the heating apparatus, a Bunsen burner in this case.

of such products as do not require any extraordinary degree of cold for the condensation of their vapour—as, for instance, for the production of hydrocyanic or nitric acid. The globular vessel in which the neck of the retort is inserted is from its function termed the *receiver*. Cold may be applied to the neck of the retort—for the purpose of condensing the vapour—in various ways, as by the application of a cold wet cloth, by a current of water, or by a special apparatus known as *Liebig's Condenser*, shown in the figure at BB.

In ordinary cases requiring a higher temperature than glass could bear earthen retorts are used; for the preparation of hydrofluoric acid retorts of lead are employed; while for the preparation of strong sulphuric acid platinum is the best material for the retort. Iron retorts are employed in the laboratory for the preparation of oxygen from black oxide of manganese and some other processes, and in gas-works for the destructive distillation of coal. See Distillation.

Retours. See Records (*Scotland*).

Retreat, a period of retirement to a religious house, for self-examination, meditation, and prayer. Retreats commonly last either three or seven days, and are conducted by a cleric, who delivers addresses daily. They are in use both in the Roman and, among the High Church party, in the Anglican Church.

Retriever. As the name implies, the retriever is a breed of dog trained to find out and bring back any killed or wounded game. The work of the retriever was long done by various breeds of dogs, such as the pointer, setter, or spaniel, but, in addition to it spoiling these dogs for their regular work, they were found to be too hard-mouthed, the worst fault possible in a retriever, as he wastes more in game injured than would have been lost without him. Crosses with the Newfoundland were tried, and gradually two kinds of retriever were introduced. One variety, known as wavy-coated, was probably the result of a cross with the setter; and the other, known as curly-coated, is from the water-spaniel or poodle. Not much attention was paid to the retriever until the introduction of dog shows, about 1850, but since that time the breed has been kept free from any fresh cross, with a great improvement in the appearance. The two varieties of retriever differ only in coat; the curly coat should curl closely and firmly all over the body, the wavy coat should fall straight and thick. An intelligent large head, with a full clear eye, should always be seen in the retriever. Legs and feet need to be large and strong. The retriever should not be too small, as it needs a powerful dog to retrieve a hare successfully. The retriever makes a very good watch-dog, and numberless bad specimens of the breed are to be found fulfilling this vocation only. The pure retriever is gentle in temper and easy to command.

Retrograde, in Astronomy, a term applied to the motion (real or apparent) of a celestial body when that is opposite in direction to the yearly course of the sun from west to east. The superior Planets (q.v.) retrograde when in opposition (see Conjunction). As their motion is then nearly parallel to the earth's, they, moving more slowly than it, appear to *fall behind* for a time. This period of retrogradation is of course longer for the planets whose motion is slower, and less for those whose speed more nearly approaches that of the earth. The inferior planets, which move faster than the earth, retrograde when in inferior conjunction. Their course being then nearly parallel to the earth's, they gain upon it, and appear to pass the sun from east to west. Thus Venus, when nearing the end of her appearance as an evening star, descends each night nearer to the western horizon, until so near the sun as to be lost in his rays. Passing then to his west side, the planet reappears as a morning star.

Retz, Jean François Paul de Gondi, Cardinal de, was born at Montmirail in 1614, of a family originally Italian, that had acquired great estates in Brittany and formed connections with the noblest families of France. His uncle was Archbishop of Paris, and he was early destined for the church in spite of amours, duels, and every

form of unclerical behaviour. A friend reproaching him with his debts, 'Cæsar,' said the splendid young prodigal, 'at my age owed six times as much as I do.' Retz was entangled in political intrigues from his childhood up, even under the watchful eye of Richelieu, and, having at length in 1643 obtained the coadjutorship with reversion of the archbishopric of Paris, he skilfully used the position to make the Paris populace devoted to himself. He plotted actively against Mazarin, and was one of the main instigators of the outbreak of the Fronde in October 1648. During the next four years he rose and fell with the fortunes of his party, receiving, however, a cardinal's hat from Rome, until 1652, when he was flung into prison, first at Vincennes, then at Nantes. After two years he made his escape, wandered in Spain and England, appeared at Rome—where, it is said, he secured the election of Pope Alexander VII.—and at length in 1662 made his peace with Louis XIV. by resigning finally his claim to the archbishopric in exchange for the abbacy of St Denis and restoration to his other benefices, with arrears. He spent the rest of his life mainly in quiet at Paris, at Commercy, and St Mihiel in Lorraine. His enormous debts, reaching to four millions of francs, he provided for in 1675 by determining to 'live for his creditors,' making over to them his whole income save 20,000 livres. He died at Paris, 24th August 1679.

Retz was connected by marriage with Madame de Sévigné, and figures in a perhaps too pleasing light in her delightful letters. His *Mémoires*, coming down but till 1655, throws much light on the dark and troubled intrigues of the Fronde, and displays quite remarkable skill in narrative and elaborate character-drawing. His own character has been sketched with faithful, if unkindly, truth by his great antagonist, La Rochefoucauld, and the sum of the whole is contained in the words: 'He has raised up the greatest disorders in the state without having formed any plan how to profit by them.'

The earliest edition of his masterpiece in a kind peculiar to French literature appeared at Nancy in 1717, but the first adequate edition was given in the 24th vol. of Michaud and Poujoulat's collection (Paris, 1836). Later and better editions are by Géruzez (1844) and Champollion-Figeac (1859); but the best is that in the series of 'Les Grands Écrivains de la France,' edited successively by A. Feillet, J. Gourdault, and R. Chantelauze (10 vols., i.–ix., 1872–88). See works by Curnier (2 vols. 1863), Topin (3d ed. 1872), Chantelauze (3 vols. 1878–79), and Gazier (1876).

Retz, Rais, or Raiz, Gilles de, a 15th-century monster of iniquity, was a Breton of high rank and family connections, who distinguished himself under Charles VII. in the struggle with the English, fighting by the side of the Maid at Orleans, and bearing the alms-dish at the coronation. Born in 1404, he was made marshal of France at twenty-five, but soon retired to his estates, where for over ten years he is alleged to have indulged in the most infamous orgies, having kidnapped or enticed to his castle as many as 150 children, who were sacrificed as victims to his unnatural lusts or his sorceries. He was at length hanged and burned at Nantes in 1440, after a trial closed by his own confession. It should be noted that the whole story is by no means free from suspicion, and, moreover, that both the Bishop of Nantes and the Duke of Brittany were active personal enemies of Retz. Attempts have been made to find in him an historical original for 'Bluebeard' by persons ignorant of the world-wide diffusion of stories of forbidden chambers and punishments for curiosity. See Baring-Gould's *Book of Were-Wolves* (1865).

Retzsch, Friedrich August Moritz, painter and engraver, was born in Dresden, 9th December 1779, and studied at the academy of his native city, where he became a professor in 1824. He died 11th June 1857. He has acquired great celebrity by his etchings in outline of Schiller and Goethe—those of Goethe's *Faust* being particularly well known—Fouqué's tales, and Shakespeare. His masterpiece is 'The Chess-players' (Man against Satan). Retzsch likewise painted admirably in oils.

Reuchlin, Johann, also known by his Græcised name of *Capnio*, humanist and one of the first promoters of Hebrew studies in Germany, was born at Pforzheim in the Black Forest, 28th December 1455. He received his earliest education at Schlettstadt, and in 1473 was appointed travelling companion to Prince Friedrich of Baden. In this capacity he visited Paris, where he studied Greek under Hermonymus of Sparta, besides assiduously practising the composition of Latin. Two years later Reuchlin went to Basel, where he continued his study of Greek, and wrote his Latin dictionary, *Vocabularius Breviloquus* (1476). In the same year he paid a second visit to France, studied law at Orleans (1478) and at Poitiers, then, returning to Germany (1481), set up as lecturer at Tübingen. In 1482 and again in 1490 he was in Italy on the business of Duke Eberhard; in 1492 we find him studying Hebrew under a learned Jew, Jacob Jehiel Loans, the imperial physician. In 1496 Reuchlin went to Heidelberg, where he became the main promoter of Greek studies in Germany, though not a public lecturer. In 1498 he was sent to Rome by Philip the Elector-palatine, and applied himself more vigorously than ever to the study of Hebrew and Greek. Reuchlin returned to Stuttgart in 1499, and in 1500 obtained a judicial appointment. In 1506 appeared his *Rudimenta Linguæ Hebraicæ*. His Hebraic studies, which embraced the post-biblical Jewish literature, were drawing him into bitter strife with learned Jews, Jewish proselytes, and the Dominicans, and directly and powerfully helping on the Reformation. It was in 1510 that Johann Pfefferkorn, a Jewish proselyte, in the true spirit of a renegade, called upon princes and subjects to persecute the religion of his fathers, and especially urged the emperor to burn or confiscate all Jewish books except the Bible. Reuchlin remonstrated, maintaining that no Jewish books should be destroyed except those directly written against Christianity. This tolerant attitude drew upon Reuchlin the enmity of the Dominicans, and particularly the inquisitor, Jakob von Hoogstraten. These enemies of Reuchlin held possession of the universities of Paris, Louvain, Erfurt, and Mainz; but all the distinguished and independent thinkers in Germany were on the side of the brave and humane scholar. Among the Reuchlinists we may especially mention the names of Ulrich von Hutten (q.v.) and Franz von Sickingen (q.v.); and to this controversy we owe the *Epistolæ Obscurorum Virorum* (q.v.). A quarrel broke out between Ulrich Duke of Würtemberg and the Swabian League, in the course of which Reuchlin became a prisoner of Duke Wilhelm of Bavaria, who, however, in 1520 appointed him professor at the university of Ingolstadt. In 1522 the plague broke out at Ingolstadt, and Reuchlin taught once more for a term at Tübingen, but soon after fell sick and died at Liebenzell, near Hirschau, on the 30th of June.

Reuchlin edited various Greek texts, published a Greek grammar, a whole series of polemical pamphlets, and a satirical drama (against the Obscurantists), and in *De Verbo Mirifico* and *De Arte Cabbalistica* shows a theosophico-cabbalistic tendency. See Lives by Barham (Lond. 1843), Geiger (1871), Horawitz (1877), and a work on him by Holstein (1888).

Reumont, Alfred von, a German historian, was born at Aix-la-Chapelle on 15th August 1808, and died there on 27th April 1887, having from

1829 to 1860 followed a diplomatic career, chiefly in Italy. His numberless works deal mainly with Italian history, and one of the best known, his *Lorenzo de' Medici*, appeared in English in 1876.

Réunion, formerly called ÎLE DE BOURBON, an island belonging to France, and lying in the Indian Ocean, 115 miles SW. from Mauritius and 350 E. from Madagascar. An ellipse in shape, it has an area of 764 sq. m., being 38 miles in length and 28 in breadth. Pop. (1894) 171,750, mostly Creoles, but including 15,000 negroes and nearly 30,000 natives of India. The backbone of the island is a volcanic range, culminating in two highest peaks, the Piton de Neiges (10,069 feet) in the centre of the island, and in the south-east Piton de Fournaise (8612 feet), one of the most active volcanoes in the world. The central parts of the island between these volcanic peaks consist of plateaus and terraces, separated by deep cauldron-shaped valleys and narrow, but profound, gorges and ravines. Piton de Fournaise is surrounded by a vast dreary desert called the *Pays Brûlé* ('Burnt Land'). Except in the mountainous parts the soil is in general very fruitful. The scenery is often beautiful. Streams, although not large, are very numerous, and fall in cascades to the sea. The climate is hot, but on the whole not unhealthy. Rainfall averages 45½ inches in the year. Cyclones sometimes occur during the hotter and rainy part of the year (November to April), and high spring-tides occasionally do serious damage during the remaining drier months. One-third of the island is cultivated, one-third under timber, and one-sixth is grass-land. Tropical fruits, sugar (the staple crop), coffee, vanilla, cinchona, maize, vegetables (potatoes, &c.), spices, tobacco, and similar products are grown. The total trade is estimated at 1½ million sterling—exports, £650,000; imports, £700,000 to £900,000. By far the most important article of export is sugar (£450,000); coffee, vanilla, rum, potatoes, and tapioca are the other chief exports. The imports consist principally of rice, claret, and in a secondary degree lard, live cattle, fish, grain, coal, oils, flour, and cloth. The capital of the island is St Denis, on the north coast, with 33,000 inhabitants, a college, a botanic garden, &c.; it is a bishop's seat. The remaining towns are St Paul, on the north-west, with 29,000 inhabitants, and with marine workshops; St Pierre, on the south-west coast, pop. 25,009; Pointe des Galets, the new port, between St Denis and St Paul; and Salazie, with warm mineral springs, a health-resort of 6000 inhabitants. The coast towns are connected by a railway 78 miles long. The colony costs France some £170,000 every year, and is administered by a governor and a council of thirty members. Réunion and Mauritius were discovered by the Portuguese navigator, Mascarenhas, and named after him the Mascarene Isles. The French took possession of this island in 1649, and called it Bourbon, which was changed to Réunion at the Revolution, and to Isle Bonaparte in 1809. Réunion has been the official name since 1848. The island was in the possession of Britain from 1810 to 1815.

See Bory de St Vincent, *Voyages* (1804); Maillard, *Notc sur la Réunion* (1862); Roussin, *L'Île de la Réunion* (4 vols. 1882–90); and W. D. Oliver, *Crags and Craters: Rambles in Réunion* (1897).

Re'us, a town of Spain, 58 miles by rail SW. of Barcelona and 4 N. of its seaport, Salou. The prosperity of the place dates from about 1750, when a number of English merchants settled there. It is a busy centre of the cotton, silk, and silk ribbon industries, prepares wine, and manufactures soap, brandy, and leather. Pop. 27,505.

Reuss, a tributary of the Aar in Switzerland, rises on the northern face of the St Gothard, flows northwards past Andermatt and Amsteg, between which places its bed lies at the bottom of a wild and narrow gorge, spanned by the Devil's Bridge and other wonders of Swiss roadmaking, and enters the southern end of the Lake of Lucerne. This it leaves again at its northern end, at the town of Lucerne, and, still going nearly due north, reaches the Aar near Windisch (Aargau). Its length is 90 miles; its basin, 1317 sq. m.

Reuss, the name of two sovereign principalities of Germany, lying between the kingdom of Saxony on the E., the Prussian duchy of that name on the N., and Bavaria on the S. Since 1666 the possessions of the House of Renss have been divided between the Elder and the Younger lines. The principality of Reuss-Greiz (the Elder Line) is 122 sq. m. in extent, and had (in 1890) 62,759 inhabitants. The chief town is Greiz (q.v.). The principality of the Younger Line is Reuss-Schleiz-Gera. Area, 319 sq. m.; pop. (1890) 119,555. Capital, Schleiz (q.v.). Of both principalities the surface is hilly, being traversed by the Frankenwald (Thüringer Wald), whose summits reach upwards of 2000 feet in height. The chief rivers are the Saale and the White Elster, the valleys of which are well cultivated. More than a third of each state is covered with forests; cattle are fattened on the extensive meadows; and woollen, cotton, and silk goods are woven. The reigning prince of each state is a hereditary sovereign, and in each state always bears the name of Heinrich (Henry). He is the executive. Reuss-Greiz has a legislative assembly of twelve members, of whom nine are chosen by the people for six years; Renss-Schleiz-Gera has an assembly of fifteen members, of whom twelve are chosen for three years by the people.

Reuss, EDUARD, a learned Protestant theologian, was born at Strasburg, July 18, 1804. He first studied philology at Strasburg, then theology there, at Göttingen, and at Halle, and oriental languages at Paris under Silvestre de Sacy; next qualified as *privat-docent* in the theological faculty at Strasburg, and filled a chair as ordinary professor from 1836 to 1838, and again after the re-establishment of the university from 1872 to 1888. He died April 15, 1891.

His chief works are *Geschichte der heiligen Schriften Neuen Testaments* (1842; 6th ed. 1887; Eng. trans. Boston, 1884); *Geschichte der heiligen Schriften Alten Testaments* (1881); and *Histoire de la Théologie Chrétienne au Siècle Apostolique* (1852; 3d ed. 1864; Eng. trans. 1872); *Histoire du Canon des Saintes Ecritures dans l'Église Chrétienne* (1862; Eng. trans. Edin. 1884); and *La Bible, Traduction nouvelle avec Commentaire* (19 vols. 1877–79). With Baum and Cunitz he commenced in 1863 the publication of a monumental edition of Calvin's works (44 vols. up to his death).

Reuter, FRITZ, German humorist, was born at Stavenhagen ('Stemhagen') in Mecklenburg-Schwerin, on 7th November 1810. His father, the burgomaster, sent him to Rostock and Jena to study law. But in 1833 he was arrested and condemned to death—in common with other members of the Jena *Burschenschaft* (q.v.) *Germania* he had indulged in wild students' talk about the fatherland and national unity; that was his only offence. The capital sentence was, however, commuted to one of thirty years' imprisonment. Young Reuter was dragged from one fortress prison to another in Silesia, Prussia, and Mecklenburg, and often subjected to great hardships and even wanton cruelty, and did not regain his freedom until Frederick-William IV. ascended the throne of Prussia in 1840. Although a general amnesty gave him back his liberty after seven years of imprisonment, his career was spoiled and his health incurably ruined; an affection of the

stomach created in him an abnormal craving for strong drink, which he never conquered. It was eleven years more before he settled down to his life's work. His father, a stern and severe man, having in the meantime turned his back upon him as a good-for-nothing, he tried to resume his legal studies, learned farming, taught pupils, but lived chiefly on the kindness of a friend and on a small annuity left him by his father, who died in 1845. Reuter began to write first in High German; but having thrown into rough verse form, in Low German, the jokes and merry tales of the countryside, he published them—*Läuschen un Rimels* (1853; 18th ed. 1889), and the book became at once a great favourite with all who spoke and read Low German. Two years later he wrote an equally successful Low German poem, *Reis' nah Belligen* (12th ed. 1884), describing in broad humorous fashion the journey of certain peasants to Belgium in search of culture. The next seven years (1856–63), passed at Neubrandenburg, were the period in which he wrote his greatest books. The first of these were a second volume of *Läuschen un Rimels* (1858; 15th ed. 1889), and the deeply tragic poem *Kein Hüsung* (1858; 11th ed. 1891), picturing the wretchedness of the semi-serfs on the great Mecklenburg domains. The rest, except *Hanne Nüte* (1860; 13th ed. 1884), a poetic narrative in which birds figure prominently as speaking characters, were all written in prose in Low German (*Platt-Deutsch*), and were published under the general title of *Olle Kamellen*, which may be given in English as *Old-time Stories*. These books, more especially *Ut de Franzosentid* (1860; 17th ed. 1891; Eng. trans. as *The Year '13*, 1873), *Ut mine Festungstid* (1862; 15th ed. 1891), and his masterpiece, *Ut mine Stromtid* (1862–64; 17th ed. 1891), spread Reuter's fame abroad through all Germany, and lifted him to the proud position of Germany's greatest humorist next after Jean Paul; as a literary artist he ranks in many respects above Jean Paul. These tales have the indubitable flavour of real life: they deal with the characters and doings of rural Mecklenburg, are told with the verve of the born story-teller, and are bathed in the purest and sunniest humour. Like every true humorist, Reuter is master of a tender pathos. Uncle Bräsig in *Stromtid* is one of the greatest creations of German literature. The best witness to Reuter's own character is the history he wrote (*Ut mine Festungstid*) of the miserable seven years he spent in prison: the book has not one word of bitterness or a single trace of revengeful feeling throughout; good-nature and humour are its dominant notes. Besides the works quoted, Reuter also wrote *Schurr Murr* (1861; 11th ed. 1886), sketches of country life, partly autobiographical; *Dörchläuchting* (1866; 11th ed. 1886), a kind of humorous historical novel; the satirical *Urgeschicht von Meckelnborg* (1874), and others. Reuter lived at Eisenach in Thuringia, at the foot of the Wartburg, from 1863 till his death on 12th July 1874.

His *Sämmtliche Werke* were published in 13 vols. at Wismar in 1863–68; to these Adolf Wilbrandt added two more in 1875, together with a biography. The 7 volumes of a popular edition (1877–78) have each gone through several editions. Other biographies of him have been written by Glagau (2d ed. 1875) and Ebert (1874). See also Gaedertz, *Fritz-Reuter-Reliquien* (1885) and *Reuter Studien* (1890), and consult M'Callum's *Studies in Low German Literature* (1884).

Reuter, Baron Paul Julius, well known from the familiar newspaper heading 'Reuter's Telegram,' was born at Cassel, 21st July 1821. In Aix-la-Chapelle he formed in 1849 an organisation for collecting (partly by pigeon post) and transmitting by telegraph commercial and financial news; and in 1851 he transferred his headquarters to London. As telegraphs extended throughout the world he multiplied the ramifications of his system till it embraced the remotest regions. He even maintained couriers where the telegraphs did not reach—e.g. between Pekin and Kiachta. In 1865 Reuter converted his business into a limited liability company, and in 1871 he was made a baron of Germany. In 1872 the Shah of Persia gave him the sole right of making railways, working mines, forests, &c.—a monopoly never made effective, and annulled in 1889, when the concession of the Imperial Bank of Persia was conferred on him. He died 22d February 1899.

Reutlingen, a town of Würtemberg, 8 miles E. by S. of Tübingen and 20 S. of Stuttgart. Many of its houses are old and picturesque. The church of St Mary (1247–1343), with a tower 243 feet high, is a noble Gothic edifice. Woollen and cotton yarns are spun, and cloth, leather, cutlery, hosiery, paper, &c. are manufactured. Reutlingen was formerly a free imperial town and a member of the Swabian League; it came to Würtemberg in 1802. Pop. (1890) 18,542.

Reval, or Revel, a Russian seaport, capital of Esthonia, stands on a small bay on the south side of the Gulf of Finland, opposite Helsingfors (52 miles distant), and 232 miles by rail WSW. of St Petersburg. It is divided into the (old) upper and (new) lower towns. The former contains the cathedral, the castle, governor's residence, and the houses of the (German) nobility. The new town extends outside the city walls. There are several mediæval guild-houses, in some of which are preserved valuable archives, and an important museum of antiquities. Reval exports cereals (chiefly oats), spirits, flax, and other commodities to the value of more than 2½ millions sterling; and imports cotton, coal, and other goods to the value of 6½ millions. There is little industry, brandy, vinegar, and wool being manufactured to a small extent. Pop. (1897) 64,578, of whom more than one-half were Esthonians, and nearly one-fourth of German descent. Reval was founded by Waldemar II. of Denmark in 1219, and became a flourishing Hanse town. It was long held (from 1346) by the Livonian Knights, was made over to Sweden in 1561, and was besieged by Peter the Great and annexed to the Russian empire in 1710. In 1713 a naval harbour was founded. See works by Bunge (1874), Amelung (1884), and Hansen (3d ed. 1885).

Revalenta Arabica. See Lentil.

Reveillé (the true French form being *réveil*), the morning call for troops. See Bugle.

Revelation is a familiar theological expression, commonly applied to the knowledge of Himself which God has given to man in Holy Scripture. In itself, however, the word is properly used not merely of the divine knowledge communicated to us in Scripture, but of all divine knowledge communicated through whatever source. Conscience and reason are in themselves modes of revelation, in so far as they witness to us of the divine laws which bind our moral life, and in harmony with which the health and happiness of that life can alone be found. History is also a species of revelation, unfolding, as it does, the same divine laws collectively in the race. Then nature reveals the divine power, wisdom, and goodness; and science, the interpreter of nature, in so far as it makes known the great laws governing the material universe, truly makes known the divine will to us. But it is with the Scriptures of the Old and New Testament that the idea of revelation has come to be especially associated. The Holy Scriptures are by all Christians regarded as in a special sense the medium of divine revelation to the human race; God having therein made known more fully and

clearly than elsewhere His will and character. But at the same time we must not confound revelation, in its fact and essence, with the books of Scripture. These books are only the highest or most distinguished form or *medium* of revelation, which, in itself, and essentially, must always imply communication from one mind to another, and, in a religious sense, from the divine to the human mind. Scripture is, in its several books, regarded as the pre-eminent medium of this contact or interchange of the divine and human, as the record of special communications which God made in time past to holy men, 'who spake as they were moved by the Holy Spirit.' It *contains*, in short, a revelation for us; but the revelation is not the record, but the knowledge which the record conveys to our minds. See BIBLE, INSPIRATION.

Revelation, BOOK OF, the last book of the New Testament canon. *Tradition.*—In the oldest extant MSS. the title is simply 'Apocalypse [i.e. Revelation] of John' (*Apokalypsis Ioannou*), and thus does not go beyond what the book itself declares. The further designation of the author in the *textus receptus* (followed by the Authorised Version) as John 'the divine' has no good MS. authority, but is an echo of the undoubtedly early tradition which identifies him with the author of the fourth gospel (who was called *theologos*, translated 'the divine,' first by Eusebius, because he begins his gospel not with the earthly genealogy of Jesus but with the doctrine of the divinity of the Logos), and of the tradition which identifies the author of both works with John, the son of Zebedee, one of the twelve apostles. Other comparatively ancient forms of the title, still more explicit in this sense, are 'The Revelation of John the Divine and Evangelist,' and 'The Revelation of the Apostle and Evangelist John.'

The 'Apocalypse of John' is included in the Muratorian canon; it was also reckoned by Origen among the 'homologoumena' or 'acknowledged' books of New Testament Scripture. It was held in high esteem by Irenæus, Hippolytus, Clement of Alexandria, and Tertullian. Justin Martyr (*circa* 147) makes reference to it as the work of the apostle John, and it was used by Theophilus of Antioch (*circa* 180) and Apollonius, and commented on by Melito of Sardis (*circa* 170). Outside the Catholic Church it was accepted by the Montanists. On the other hand, it was rejected by those whom Epiphanius calls Alogi and by the Marcionites, while within the Roman church its claims were disputed by an ecclesiastic named Gaius or Caius; his arguments in turn were controverted in an apologetic writing by his contemporary, Hippolytus. It is mentioned as one of the 'antilegomena' or 'disputed' works by Eusebius; it is absent from the Syriac, and from the Memphitic and Thebaic (Egyptian) versions of the Scripture, and from the lists of Cyril of Jerusalem, Gregory Nazianzen, and Chrysostom, as well as from the canon of the Council of Laodicea, and from the so-called 'apostolic canons.' There is no trustworthy evidence that Papias knew it.

As regards authorship, the book itself claims to be written by 'John, the servant of Jesus Christ,' 'who bare witness of all things that he saw;' and it is to be observed that many of the incidental references to it in early writers are evidently mere repetitions of this statement. But the reception of the Apocalypse into the canon was no doubt partly determined by the belief that this John was the son of Zebedee. This belief is implied in the Muratorian canon, and that he was the apostle is categorically stated by Justin Martyr and Irenæus. Dionysius of Alexandria (*circa* 250), however, while not disputing the canonicity of the book, found himself unable to overcome the arguments of certain who had preceded him against its apostolic authorship, and he accordingly assigned it to 'some other' John—perhaps (he thought) John the Presbyter. Eusebius with some definiteness assigned it to the last named.

As to the time of its composition tradition is far from consistent. The author of the Muratorian fragment, for example, incidentally places it earlier than the Pauline epistles; but Irenæus expressly states that it 'was seen towards the close of the reign of Domitian.' This statement of Irenæus is sometimes interpreted as implying that the book was also written then; but more probably he intended his readers to understand that it was written after Domitian's death—under Nerva, or perhaps even in the reign of Trajan, to which period, according to Irenæus, the apostle survived. But Tertullian seems to suggest the time of Nero as the date. Jerome dates the supposed banishment of John certainly, and the writing probably, in the 14th year of Domitian; but in this, perhaps, he is only repeating Irenæus. There is some reason to think that this date is partly derived from an interpretation of Rev. i. 9 which is not now usually accepted. Epiphanius mentions the time of Claudius. The place where the revelation was received is professedly Patmos, and ancient writers usually assumed that it was also committed to writing there.

The discussions of the Apocalypse by Melito and others have not been preserved; but from the earliest extant commentary—that of Victorinus (*circa* 300)—it may be inferred that no systematic attempt at a consistent interpretation of the work as a whole was undertaken by any ancient writer. Attention was for the most part confined to two or three isolated points. It need hardly be said that, as regarded the millennium, the ancient church was entirely of the 'futurist' school, and that in those quarters where the Apocalypse was most prized as an authentic vision of the future the interpretation always tended to be literalist and 'chiliastic.' As for another conspicuous feature—the beast and the number of the beast (see APOCALYPTIC NUMBER)—it is surprising how early the key to this enigma seems to have been lost. Irenæus confesses ignorance, and can only resort to timid and tentative conjecture. Victorinus, however, explained Rev. xiii. 3 as having reference to Nero; and so also did Sulpicius Severus. To Origen and the Alexandrians, with their allegorising methods of interpretation, the problems of the Apocalypse were of comparatively little interest. Later, after the time of Constantine, the 'beast' was identified with pagan Rome, or the seven heads of the beast with seven world-empires, and Augustine was one of the first to give currency to a form of 'preterism,' holding that the millennium began with the Christian era—a belief which again became active in the 11th century. With the lapse of time came almost inevitable modifications, both of the preterist and of the futurist view, alike among those who held that the threefold series of visions (seals, trumpets, vials) in the book related to chronologically successive events, and to those who, with Augustine, viewed them as parallel (theory of 'recapitulation'). Mediæval sects recognised the papacy in the woman on the scarlet beast, an interpretation which afterwards in one form or another became widely current throughout the Protestant domain, and still holds its ground in many quarters.

Modern Criticism.—The modern criticism of the Apocalypse may in a sense be said to have begun with Luther, who in the preface to the first edition of his New Testament (1522) declared that for many reasons he was unable to accept this book as either apostolic or prophetic—'My spirit cannot adapt itself to the book.' The chief reasons he alleged

were the little prominence it gave to Christ, and the peculiar manner of its teaching, so unlike the rest of the apostolic teaching or that of Christ himself. In 1530 he somewhat modified the language he had used, but he never withdrew his unfavourable opinion. The prevailing view of the Lutheran divines of the 16th and 17th centuries (Carlstadt, Flacius, and others) was that the Apocalypse can claim at best only the third and lowest degree of canonical authority. Zwingli in 1528 refused to regard it as Scripture or to admit the validity of doctrinal proofs derived from it. Calvin abstained from commenting on it. Its 'deutero-canonical' character, however, was never made prominent in Britain, and was gradually lost sight of even in Germany. Mention may perhaps be made of the English work of Abauzit on the Revelation (1730), which called forth some controversy at the time of its appearance; but, strictly speaking, the discussion of the critical problems of the book did not enter upon its modern phase until the time of Semler, 'the father of modern biblical criticism,' who in 1769 and following years, from a comparison of the fourth gospel with the Apocalypse, argued that an apostolic authorship could not possibly be claimed for both, and, starting from this canon, denied it to the latter. The same view was taken up by Schleiermacher and his immediate disciples, the most brilliant of whom—De Wette—ultimately gave out this 'disjunctive canon' as one of the most firmly established conclusions of modern criticism (1826); so also Ewald (1828). To obviate the force of some at least of Semler's arguments, those who wished to maintain the apostolic origin of both works found it important to make out an earlier date for the Apocalypse than the currently accepted tradition, following Irenæus, had assigned to it. In their efforts to do so they were powerfully supported from 1845 onwards by the Tübingen school, which had also accepted the 'disjunctive canon,' though choosing the opposite alternative to that adopted by Schleiermacher, and maintained the apostolic character of the Apocalypse, ranking it indeed as one of the five undoubtedly genuine remains of the apostolic age (Baur, followed by Schwegler, Zeller, S. Davidson, &c.). Various opponents of the Tübingen school followed Semler and De Wette in arguing for the non-apostolic authorship of the Apocalypse at least. Thus, Lücke and Neander attributed it to some unknown John; Ewald, Bleek, Düsterdieck to the presbyter John; Hitzig to John Mark. Meanwhile all sections of the historical school of exegesis were at one in the effort to see and if possible understand the book in the light of the actual circumstances of its writer. Among the details that came into greater clearness were the historical references in the beginning of chapter vi., the indication of date supplied by xi. 1, 2, and a very probable explanation of the number of the beast ('Nero Cæsar') which was first given by Fritzsche in 1831 and afterwards rediscovered, independently it is said, by Benary, Hitzig, and Reuss in 1837. Much of the evidence pointing to an early date for the book was, as already indicated, specially welcome to those who still maintained the apostolic authorship alike of the Gospel and of the Revelation, for it was becoming increasingly plain that the differences of language and conception between the two works were peculiarly inexplicable if both were assumed to belong practically to the same period in the life of their common author.

On the other hand it was felt to be difficult wholly to set aside the traditions which pointed to a later date, especially as these best explained some of the doctrinal peculiarities of the book, and many of the phenomena presented by the condition of the 'seven churches' to whom the book is primarily addressed. The two-sided character of the evidence, both external and internal, as to date is indeed obvious when one looks at it with any care; and as early as the middle of the 17th century it had occurred to Grotius (1644) that the problem raised by it might perhaps be solved by the assumption that the book was written by its one author at different times, partly in Patmos and partly at Ephesus. Vogel in the beginning of the 19th century (1811–16) offered a different solution—that it was written partly by the apostle John and partly by the presbyter John, a theory which seems to have had some attraction for Schleiermacher, and, temporarily at least, for Bleek. The theory of a composite origin of the work has in a variety of forms come into very great prominence quite recently. Thus, according to the acute analysis of Völter in his singularly able and instructive work *On the Origin of the Apocalypse* (1882; new ed. 1885; compare the appendix to Simcox's *Commentary*), the original Apocalypse as written by the apostle in 65–66 A.D. consists of i. 4–6; iv. 1–v. 10; vi. 1–vii. 8; viii.; ix.; xi. 14–19; xiv. 1–7; xviii. 1–xix. 14; xiv. 14–20; xix. 5–10. To this the apostle himself three years later (68–69 A.D.) added x. 1–xi. 13; xiv. 8; xvii. It received subsequent additions by other hands in the time of Trajan (xi. 15, 18; xii.; xix. 11, 12; xx.; xxi. 1–8), of Hadrian (v. 11–14; vii. 9–17; xiii.; xiv. 4, 5, 9–12; xv. 1–xvii. 1), and of Antoninus Pius (prologue, the epistles to the churches, &c.). A new line of investigation in the same direction was opened by Vischer, who (*The Revelation of John a Jewish Apocalypse*, 1886) sought to show that the groundwork of the composite book was primarily not Christian but Jewish, written in Hebrew, but translated and freely adapted by a Christian redactor. This view was accepted by Harnack (1886), and substantially, though with large modifications, by Pfleiderer (1887) and Weyland (1888). Schön also (1887) and Sabatier (1888) maintained the composite character of the work, holding it, however, to be essentially of Christian origin (end of 1st century), but with incorporation of Jewish fragments. The most powerful and suggestive of recent works based on the theory of composite origin is that of Spitta (*The Revelation of John*, 1889), who distinguishes a Christian Apocalypse, dating from about 60 A.D., which he attributes to John Mark (i. 4–6, 9–19; ii. 1–6, 8–10, 12–16, 18–25; iii. 1–4, 7–11, 14–20; iv. 1–4, 5*a*, 6*a*, 7–14; v.; vi.; viii. 1; vii. 9–17; xix. 9*b*, 10*a*; xxii. 8, 10–13, 16–18*a*, 20*a*, 21) and two Jewish Apocalypses dating respectively from Pompey's capture of Jerusalem in 63 B.C. (x. 1*b*, 2*a*, 8–11; xi. 1–13; xiv. 14–20; xv. 2–4, 6, 8; xvi. 1–12, 17, 21; xvii. 1–6; xviii. 1–xix. 8; xxi. 9–27; xx. 1, 2, 3*a*, 15) and from Caligula's time, about 40 A.D. (vii. 1–8; viii. 2–13; ix.; x. 1*a*, 2*b*–7; xi. 15, 19; xii. 1–14; xiii.; xvi. 13–16, 17*b*–20; xix. 12–21; xx. 1–15; xxi. 1, 5, 6). These three sections of the work correspond roughly, it will be seen, to the visions of the seals, the trumpets, and the vials. The work of redaction, Spitta holds, was done towards the end of the 1st century. He finds the original number of the beast (616) in the name of Caligula (Gaius Cæsar), and considers that it was only afterwards adapted to that of Nero (666). The treatises on the Revelation by Erbes (1891) and Schmidt (1891) are in tendency similar to that of Spitta. The subject they deal with is still under active discussion; but it is already felt by all competent judges that the investigation thus inaugurated is likely to lead to valuable results, and ultimately perhaps may be found to afford an approximate solution of most of the still unsolved problems connected with the Apocalypse, and so make it,

instead of being the obscurest, one of the clearest documents relating to the development of thought and feeling in primitive Christian times.

Literature.—For the text of the Apocalypse, which is more unsettled than that of any other New Testament book (the five uncial MSS. present the unusually large proportion of 1650 various readings in somewhat over 400 verses), B. Weiss's edition, with critical notes (Leip. 1891), ought to be consulted. On the modern critical questions, besides the recent works of Völter, Spitta, and others already named, the best introductions are those of Reuss (6th ed. 1887), Weiss (2d ed. 1889; Eng. trans.), and Holtzmann (*Einl.* 2d ed. 1886; also special introduction to his *Hand-Commentar* on Revelation, 1891). Of older works see also Bleek's *Lectures on the Apocalypse* (1862; Eng. trans. 1875). Much useful information is given in Gloag's *Introduction to the Johannine Writings* (1891); also in Farrar's *Early Days of Christianity* (1882), Renan's *L'Antechrist* (1873; Eng. trans.), and Chauffard's *L'Apocalypse et son Interprétation historique* (1888). Of commentaries the most important or useful are those of Ewald (Latin, 1828), Lücke (1832), De Wette (1848), Ewald (German, 1862; Eng. trans.), Reuss (1878), Holtzmann (1891), and Spitta (1889; this work being specially useful for the account it takes of the mass of current apocalyptic material which presumably was at the disposal of authors and editor). The number of authors on the fulfilled and unfulfilled prophecies of the Apocalypse has been very great; most of them until very recently wrote on the assumption that every one of these either has received or is destined to receive a fulfilment recognisable as exact, and they can be classified according to their views of the manner of this realisation. Those, for example, who, following the indication of Augustine, think that the millennium has already come or even is already past, may fairly be called preterists. Of those we may mention Grotius, who identified Gog and Magog with the Turks in Europe, and Hengstenberg, who judged the millennium to have ended in 1848. All those, on the other hand, who think that the millennium, in any definite sense that can have been intended by the author, is yet to come, may equally justly be called 'futurists,' but they are of very various degrees, some holding that none of the special preliminary events which are described as leading up to the millennium have as yet taken place; while others, sometimes referred to as the 'continuous historical' school (of which Bengel is perhaps the most brilliant example), read into the book (with very wide divergences as to detail) what they consider to have been the leading incidents in the political or ecclesiastical history of Europe for the last eighteen centuries. Of the first description are most of the so-called 'millennarian' writers; to the second belong the followers of Mede (1627). Apart from these definite schools ought to be classed those interpreters of the spiritualising or idealising order who were represented in ancient times by the Alexandrians, and whose method has often been found in modern times a convenient refuge for exegetical timidity or helplessness. Recent commentators with any character for sobriety to lose have, as a rule, been exceedingly cautious in dealing with the predictive element in the Apocalypse, some maintaining that its prophecies admit of a variety of fulfilments, but without attempting concrete interpretations of the past, and still less definite forecasts of the future, by their light; while others go so far as to deny that the book is predictive in the strict sense at all, and hold that it was from the very first intended to be read as a more or less imaginary picture of the kind of vicissitudes through which the church militant has passed and may be expected to pass before it reaches its final triumph. See Düsterdieck (in Meyer's *Commentary*, 1859; new ed. 1887), Lee (in *Speaker's Commentary*, 1881), Boyd Carpenter (in *New Testament Commentary for English Readers*, 1883), Milligan (in Schaff's *Commentary*, 1883, and in *Expositors' Bible*, 1889), and Simcox (in *Cambridge Bible for Schools and Colleges*, 1890).

Revels, Master of the, the name of an officer, also called 'Lord of Misrule,' formerly attached to royal and other distinguished houses. It was his function to preside over the amusements of the court, or of the nobleman to whose house he was attached, during the Christmas holidays. The universities of Oxford and Cambridge and the Inns of Court had also their Lord of Misrule. This officer became a permanent appendage to the English court in the reign of Henry VIII., and his duties included the keeping of the tents and pavilions which accompanied the sovereign on a royal progress, as also the keeping of the dresses and masks used in entertainments given at court, and the providing of new ones when required. In Queen Elizabeth's time the Mastership of the Revels was divided into several distinct offices. The office practically fell into desuetude about the end of the 17th century. See Fools (Feast of); and Chambers's *Book of Days*.

Revenue. The public revenue of the civilised states of the world is in every case treated of in the articles on the several countries in the section dealing with finance; thus, the various elements of the British revenue at different periods, as compared with the expenditure, is somewhat fully given at Great Britain, Vol. V. p. 376. The inland revenue is distinguished from the Customs Duties (q.v.), and includes (1) the Excise (q.v.), comprising alcohol duty, liquor and luxury licenses; (2) Stamps, with the 'death duties'—probate, account, legacy, and succession duty; (3) Taxes—property and income tax, land-tax, inhabited house duty (see Taxes). The right of the Commons to regulate taxation and the outlay of the national income is treated at Parliament, Vol. VII. p. 774. Below is a comparative table of the gross revenue of the principal civilised states for the years 1889 or 1890:

France	£123,424,000	United States	£80,616,000
Russia	94,787,000	Italy	65,405,000
Great Britain	89,304,300	German Empire	62,692,000
Austria-Hungary	87,581,000	Spain	31,886,000

The revenue of Canada is £7,970,000; Cape Colony, £4,340,000; New South Wales, £9,063,397; Victoria, £8,676,081; British India, £56,166,000. In 1895–96 the revenue of Great Britain exceeded £100,000,000; in 1897–98 it was £106,614,000, besides £8,000,000 from local taxation; and with that of all the dependencies was well over £200,000,000. —For Revenue Officers, see Coastguard.

Reverberatory Furnace, a furnace so constructed that ores and other materials may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts—viz. a fireplace at one end; in the middle a flat bed or sole, on which the material to be heated is placed; and at the other end a chimney to create a draught and to carry off the smoke or fume. Between the fireplace and the bed a fire-bridge is placed, and the whole built over with a flat arch, dipping towards the chimney. The flame plays over the fire-bridge, and the heat is reflected, or *reverberated*, on the material beneath; hence the name. See Copper, Lead, and Iron (puddling furnace).

Revere. Paul, famous for his midnight ride, was born in Boston, Massachusetts, 1st January 1735, the son of a goldsmith from Guernsey, whose trade he followed after serving as a lieutenant of artillery in the expedition against Crown Point (1756). He also engaged in copperplate printing, and before the Revolution constructed a gunpowder-mill. A keen patriot, he was one of the party that destroyed the tea in Boston harbour, and he was at the head of a volunteer committee, consisting of thirty young mechanics, who formed a secret society to watch the British. When it was known that the latter intended to move, Revere crossed over to Charlestown, and on April 18, 1775, the night before Lexington and Concord, at a signal rode on to Lexington and to Lincoln, rousing the minute-men as he went; at Lincoln he

was stopped, but a companion succeeded in reaching Concord. During the war he rose to lieutenant-colonel of artillery; afterwards he returned to his goldsmith's work, and in 1801 founded the Revere Copper Company at Canton, Massachusetts. He died 10th May 1818. His ride is the subject of a well-known poem by Longfellow.

Reverend (Lat. *reverendus*, to be respected), a title of respect given to the clergy. In the Anglican Church deans are 'Very Reverend;' bishops, 'Right Reverend;' and archbishops, 'Most Reverend.' In Scotland the clergy in general are 'Reverend,' while it is the practice to apply 'Very Reverend' to the moderator of the General Assembly for the time being, and to the principal of a university, being a clergyman. The style Reverend is generally adopted by and given to the clergy of the different dissenting bodies; and in 1876 the Privy-council decided on appeal that there is no law restricting it to ministers of the Church of England. There have, however, been instances in which some dissenting ministers have repudiated it. See ADDRESS (FORMS OF).

Reversion is the right to the enjoyment of money, or of any kind of property, postponed until or contingent on the happening of a given event. Reversions are usually divided into three classes: Absolute Reversion, in which the emergence of the rights is certain, Contingent Reversion, and Reversionary Life Interests. In the first case, when the date of the emergence is also fixed, the value of the reversion is dependent merely upon the operations of interest (see INTEREST). When the date of the emergence of the reversionary right is uncertain, the purchase in an individual case must always be a speculation; but if there are a sufficient number of such rights, postponed to events of which there are sufficient observations from which to deduce laws of average, then the marketable value is easily calculated. For example, it is required to know what is the immediate value of £100 payable certainly on the death of a man aged sixty. Here the value of the reversion is £100, under deduction of the prior life interest, which in this case is the present value of annuity equal to the interest of £100 on the life of a male aged sixty. When an assurance company buys a reversion, it is simply buying that which it sells when it grants a policy of life assurance. In the former case, however, an office, to secure its expenses and profits, will assume a high rate of interest and a long life; in the latter case, for the same reason, it will assume a low rate and a short life. By the Sale of Reversions Act, 1867, no purchase of a reversion is challengeable on the ground of undervalue merely. Where the reversion is contingent, problems arise whose solution requires the utmost skill on the part of the actuary. For instance, B, aged thirty, wishes to borrow £100 on the security of a sum payable to him *in the event* of his surviving A, aged fifty-eight. Here the security being doubtful, it could only be rendered marketable by assuring a sum to be paid in the event of B dying before A; and there would remain the important question of what this sum should be, so as to cover the loan and the premiums of assurance with yearly accumulations on both. The value of a reversionary life interest is found by deducting the value of a joint life annuity from the value of the annuity on the life of the survivor (see the Institute of Actuaries' text-book, part ii.).

In law a reversion is that right to property which remains after some particular estate has ceased which had been granted by the owner. Thus, if A has a life estate in B's property, and after he dies the property returns to B, B is said to have the reversion or to be the reversioner. The landlord of property let to a tenant is called the reversioner, because the moment the lease determines, the whole of the property and possessions vest in him. In Scots law reversion means the right of redemption retained by a borrower over an estate disponed in security.

Reversion, a term used to describe the tendency of animals and plants to show characteristics of some ancestral form. Thus, horses have occasionally transverse bars on the legs and shoulders, and a blue pigeon like the wild rock-dove (*Columba livia*) sometimes appears even in a perfectly pure breed. See ATAVISM, and DEGENERATION.

Review. See PERIODICAL.

Revilla-Gigedo, a rocky and uninhabited island group in the Pacific, 400 miles west of the coast of Mexico, to which it belongs. The largest of the islets is 20 miles long.

Réville, ALBERT, a French Protestant theologian, was born at Dieppe, November 4, 1826, studied at Geneva and Strasburg, and was pastor of the Walloon Church at Rotterdam in 1851–72. Then he lived near Dieppe until his call in 1880 to the chair of the History of Religions in the College of France.

His numerous books include *Manuel d'Histoire comparée de la Philosophie et de la Religion*, based on Scholten (1859; Eng. trans. 1864); *De la Rédemption* (1860); *Essais de Critique Religieuse* (1860); *Manuel d'Instruction Religieuse* (1863); *Histoire du Dogme de la Divinité de Jesus Christ* (1869; Eng. trans. 1870); *Prolégomènes de l'Histoire des Religions* (1881; Eng. trans. 1884); *The Native Religions of Mexico and Peru* (the Hibbert Leetures for 1884); *Les Religions des Peuples Non-civilisés* (1883); and *La Religion Chinoise* (1889).

Revising Barrister. See BARRISTER.

Revival, or REVIVAL OF RELIGION, a term employed to denote an increase of faith and piety in individual Christians, particularly after a period of religious declension, and also an increase of religion in a community or neighbourhood, both through the revival of those who are already religious, and through the conversion of the previously irreligious. Such religious movements frequently extend, more or less generally, over a neighbourhood, or sometimes over a country. Instances of a similar kind are recorded in the Scriptures as occurring both in the history of the Jews and in the early history of the Christian church, particularly in the effusion of the Holy Spirit on the day of Pentecost, and afterwards in connection with the ministry of the apostles, when many were converted through a single discourse, or, in other cases, evidently within a short time. In the middle ages revivals took place in connection with the Crusades and under the auspices of the monastic orders (see CHURCH HISTORY); and sometimes with repulsive adjuncts, as in the case of the Flagellants (q.v.) and the Dancing Mania (q.v.). The Reformation of the 16th century, and the more partial movements of the same kind which preceded it, are also regarded as essentially revivals of religion—the Reformation itself the greatest which has taken place since the apostolic age. In Scotland there were notable 'works' in 1625 at Irvine and Stewarton, in 1630 at Kirk-of-Shotts, and in 1638. After the Reformation the next wide-spread movement of the kind was that in the first half of the 18th century from which the Methodist churches originated. It was accompanied with many circumstances similar to those which have attended later revivals of religion. The term revival did not begin to be commonly employed till after this period; and the revival which took place in New England and other parts of North America about the same time under Edwards, Bellamy, and the

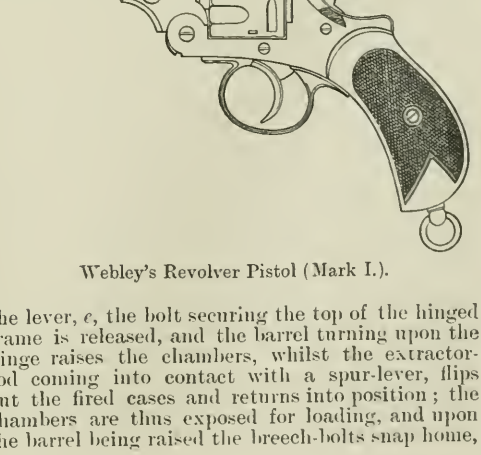
Tennents was generally designated the Great Awakening. The beginning of this revival seems to have had no connection with the Methodist movement in England, although subsequently they became connected through Whitefield's visits to North America. There were revivals at Cambuslang in 1742, and at Moulin in Perthshire in 1798–1800. A very extensive revival in Wales resulted in the formation of the Welsh Calvinistic Methodist Church, but was not confined in its effects to those who became connected with that church. Local revivals also in some instances attended the ministry of evangelical ministers of the Church of England; and in America there were revivals in 1796, in 1812–15, and again in 1827–32. In 1839 the attention of all Scotland was drawn to a religious movement at Kilsyth, originating in the preaching of Mr William C. Burns (q.v.), and this was followed by similar occurrences in a number of other places, more or less evidently connected with it. The great American revival of 1859–61 began in New England, particularly in Connecticut and Massachusetts, and rapidly extended to New York and over the middle and western states. It was not generally attended with scenes of great excitement; strong but calm religious feeling was its general characteristic. It spread all over the United States, and it was believed that in a single year half a million converts were received into the churches. A similar movement took place in Ireland, and rapidly extended over the whole north, and subsequently to Scotland, Wales, and some parts of England. As a rule it was free from excitement, and characterised by little else than the intensity of religious feeling displayed. Another remarkable revival, which extended over the greater part of Great Britain in 1874–75, originated in the efforts of two American evangelists, Messrs Moody and Sankey, and was characterised by the almost entire absence of sensationalism. The Salvation Army carries on its work largely by methods known as revivalistic. Revivals of religion have occurred also in other parts of the world. Though evangelical Christians generally recognise revivals as in the main divine works of grace, they agree in deploring the extravagances and irregularities that have not unfrequently accompanied them and done grievous harm to the cause of religion.

See Fleming's *Fulfilling of the Scripture* (1681); Edwards, *The Work of God in Northampton, Massachusetts* (1736); Robe's *Narrative* (1742); Pringle, *Surprising Accounts of the Revival of Religion in the United States* (1802); lectures on the subject by Sprague (1833) and Finney (1835); Mrs Lundie Duncan, *History of Revivals of Religion in the British Isles* (1840); Fish, *Handbook of Revivals* (1874); Porter, *Revivals of Religion* (1877); Overton's *Evangelical Revival of the 18th Century* (1886); and the journals and biographies of the Wesleys, Whitefield, the Haldanes, and other eminent evangelists.

Revival of Learning. See RENAISSANCE.

Revolution, any extensive change in the constitution of a country suddenly brought about. The most important events in modern history specifically known under this name are the English revolution of 1689 (Guizot by 'Revolution' means the 'Great Rebellion'); the American revolution of 1776; the French revolution of 1789; the revolution of 1830 ('the July revolution'), which deposed Charles X. and raised Louis-Philippe to power; the revolution of 1848 ('the revolution of February'), which established the second republic; and the revolutions by which the existing South American republics (including that of Brazil in 1890, and of Chili in 1891) were established or are from time to time modified. The revolutionary period *par excellence* is the years 1848 and 1849. The French change of constitution in 1871 is not usually spoken of as a revolution, though in effect it was one. For the Revolutionary Tribunal, see DANTON.

Revolver, in Firearms, is a weapon having barrels or chambers which revolve upon a common centre, and are fired in turn by one lock mechanism. Revolving firearms date from the commencement of the 17th century, when hand-guns having two or more barrels were mounted to turn upon an axis, and so arranged that the powder-pans came successively under the action of the lock; the barrels were not rotated by pulling the trigger, but were turned by the hand. The celebrated Marquis of Worcester invented several such. In 1815 Le Norman, a Parisian gunsmith, produced a pistol with five barrels, Devisme one with seven, but neither proved successful. The 'Mariette,' made with from four to twenty-four barrels, was the first to become popular, although from its weight, cumbrous mechanism, and short range, it could have been of little use except at close quarters. This pistol was the precursor of the 'pepper-box' pistol, to which it was closely allied; the barrels of both were bored in a solid mass of metal, and made to revolve as the hammer was raised to full cock. Not so old as the principle of revolving barrels, but still an invention of past generations, is that of a revolving chamber or breech-piece, pierced with cylindrical apertures to contain the charges, and so arranged that each chamber came successively into line with the barrel and lock common to all. E. H. Collier in 1818 patented an improved carbine with three revolving chambers, which appears to have been an efficient weapon. Colonel Samuel Colt produced his world-renowned revolver in 1835. This consists of a rifle barrel, a revolving cylinder with six or seven chambers, each furnished with its own nipple and cap, and a lever trigger, which operates the mechanism required to turn the chambers and fire the weapon. The double-action revolver is one in which by simply pulling the trigger the hammer is raised and released, and the chambers turned; whilst in the single-action revolver the hammer is raised by the thumb of the firer and released by the trigger. Breech-loading revolvers are of two kinds —the solid frame revolver, which requires the empty cases to be forced out by a diminutive ramrod (generally attached to the pistol by a swivel), and the self-extracting revolver, of which there are many kinds. The regulation pistol of the British army is that illustrated here. By pressing



Webley's Revolver Pistol (Mark I.).

the lever, *e*, the bolt securing the top of the hinged frame is released, and the barrel turning upon the hinge raises the chambers, whilst the extractor-rod coming into contact with a spur-lever, flips out the fired cases and returns into position; the chambers are thus exposed for loading, and upon the barrel being raised the breech-bolts snap home,

and the pistol is ready for firing by pulling the trigger. This principle is the most popular of any employed for self-extracting revolvers, and it has proved efficient. There are many types of revolvers, self-extracting and other, but, with the exception of cheap weapons and some single-action solid-frame revolvers popular in America, the principle adopted by the British and other governments is that most generally used. Messrs Smith & Wesson of Worcester, Massachusetts, were the first to popularise the hinged self-extracting revolver, and amongst many other models they now make one in which the hammer is covered, and the pistol can only be fired when firmly grasped by the hand; as a safety bolt, which effectually and automatically bolts the firing mechanism, projects through the haft, and has to be pressed in before the trigger can be drawn back to raise the hammer and fire the weapon. This pistol is perfectly safe, and insures immunity from such accidents as arise from careless handling. For military purposes the revolver is generally made of half-inch calibre, and such a weapon has a range of from 100 to 300 yards, whilst at 50 yards ten consecutive shots have been placed in a 4-inch bull's-eye. At shorter ranges its precision is equal to that of the finest duelling pistol. Revolving arms of large size are used as Cannon (q.v.) and Machine Guns (q.v.); and for further particulars of revolving firearms consult Galand, *Le Revolvre de Guerre* (2d ed. 1873); Gould's *Modern American Pistol and Revolver* (Boston, 1888); and British service publications.

Revue des Deux Mondes, the best known of the French magazines devoted to literature, art, and general criticism, was founded in Paris in 1831 by François Buloz. It had appeared during 1829, but was languishing until purchased by Buloz, who firmly established it. Many of the best French writers have contributed to its pages.

Rewa, a state of India, called also Baghelkhand (q.v.).—Rewa Kantha is the name of a political agency under the government of Bombay, containing sixty-one small states, of which five are tributary to the British government, and most of the remainder to Baroda. The territory included, covering an area of 4792 miles, with a total population of 543,452, lies mainly along the south bank of the lower Nerbudda with patches north of it, and on the west borders on Broach, Baroda, and Ahmadabad.

Reward, in a legal sense, means some encouragement which the law holds out for exertions in bringing certain classes of criminals to justice. By statute 7 Geo. IV. chap. 64, the courts of assize may order the sheriff of the county, in which certain offences have been committed, to pay to persons who have been active in securing the apprehension of offenders charged with murder, or with feloniously shooting, cutting, stabbing, wounding, or poisoning, or with rape, burglary, housebreaking, robbery, arson, or cattle-stealing, or with being accessary before the fact to any of such offences, or to receiving any stolen property, a reasonable sum to compensate them for expense, exertion, and loss of time. So by a later statute (14 and 15 Vict. chap. 55) courts of quarter sessions are authorised, in the case of any of the above offences which they have jurisdiction to try, to order such compensation; but the payment to one person must not exceed £5. If any one is killed in endeavouring to apprehend a person charged with one of these offences, the court may order compensation to be made to the family. The amount to be paid in all such cases is subject to regulations which may be made from time to time by the Secretary of State. By statute (24 and 25 Vict. chap. 96) it is a felony, punishable by penal servitude to the extent of seven years, to corruptly take any reward for helping a person to property stolen or embezzled, unless all due diligence to bring the offenders to trial has been used. In Britain an advertisement offering a reward for the return of stolen or lost property, using words purporting that no questions will be asked or inquiry made after the person producing the property, renders the advertiser, printer, and publisher liable to forfeit £50. For several years the offering of rewards by the government has in England been discontinued on grounds of public policy. For example, during the series of murders in Whitechapel in 1888-90, the Home Office, though urgently requested to offer a reward for the discovery of the criminal, steadily refused to do so.

Rewari, a town of the district of Gurgaon, in the extreme south of the Punjab, 50 miles SW. of Delhi by rail, an important centre for trade between Punjab and Rajputana. Pop. 23,900.

Reybaud, Marie Roch Louis, a clever French writer, was born at Marseilles, 15th August 1799, travelled in the Levant and India, and returned to Paris in 1829 to write for the Radical papers and edit the *Histoire scientifique et militaire de l'Expédition Française en Égypte* (10 vols. 1830–36), Dumont d'Urville's *Voyage autour du Monde* (1833), and Orbigny's *Voyage dans les deux Amériques* (1836). His studies in social science bore fruit as *Études sur les Réformateurs ou Socialistes modernes* (2 vols. 1840–43; 7th ed. 1864), which gained him the Montyon prize (1841) and a place in the Academy of Moral Sciences (1850). His unusually original satiric novel, *Jérôme Paturot à la recherche d'une Position sociale* (1843), became widely popular, and was followed by the less successful *Jérôme Paturot à la recherche de la meilleure des Républiques* (1848). Reybaud took an active part in politics, first voted with the Left, but after the July revolution with the Right, and was sent by the Assembly to Algeria to visit the agricultural colonies established there. His last thirty years were devoted to studies in economics. From 1850 a member of the Academy, he died at Paris 28th October 1879. Among his later works were *Marines et Voyages* (1854), *Scènes de la Vie moderne* (1855), *L'Industrie en Europe* (1856), and *Études sur le Régime des Manufactures* (1859).

Reyk'javik. See Iceland, Vol. VI. p. 62.

Reynard the Fox, a well-known popular epic the characters of which are animals instead of men. It belongs to the series of Beast-fables (q.v.) which have delighted the popular imagination from early ages and in all lands, from India to the Bushmen's country in South Africa (see Fable). The stories that relate the knaveries of Reynard the Fox seem to have originated for the most part in northern France and Flanders from the 10th century onwards, and to have been composed and recomposed repeatedly in various forms in the 12th and following centuries. The authors or editors, so far as they are known, belonged chiefly to the ecclesiastical orders. The several versions differ not only in respect of language and of style, but also in the choice and arrangement of the episodes and incidents narrated. All turn upon the knaveries of Reynard the Fox, as practised by him in his quarrel with Isengrim the Wolf, who in all encounters generally comes off second best. The best versions, as the typical Flemish and Low German (to be referred to in detail lower down), reach a high level of literary excellence. The episodes are woven together into a veritable epic; the versification is agreeable and easy; the characters are consistent and well-sustained; the contemporary manners, and the localities and circumstances, that make the background of

the story are true and realistic; and the story is told without any other obvious purpose beyond that of affording honest amusement. These features do not, however, characterise all the versions: some have been clearly written for a satirical purpose, some are loosely-connected strings of ill-told adventures, others drag out a long and weary length through innumerable indifferent verses, whilst in others still the characters are simply men disguised as animals. The earliest versions were in Latin; but they seem to have been soon supplanted by French in the 12th century, and in their new dress the stories attained a much wider popularity. Since the beginning of the 16th century nearly all the editions printed can be traced back to one of two sources, a Flemish or a Low German, both of which, however, are based upon French forms of the epic. The task of tracing the connections between the numerous versions that exist in the different tongues is one of great complexity and difficulty. It will suffice in this place to enumerate the more important, with mention of one or more trustworthy recent editions. The best Latin version, *Isengrimus* (ed. by Mone as *Reinardus Vulpes*, Stuttgart, 1832; and by Voigt, Halle, 1884), which possesses considerable literary merit, was written in Flanders about 1146–48 by an unknown author. The *Isengrimus* printed in J. Grimm's *Reinhart Fuchs* (Berlin, 1834) is not an older, but a later and abbreviated, form of the same poem. The best French versions that survive were edited by Méon (4 vols. Paris, 1826), with a supplement by Chabaille (1835), and by Martin (4 vols. Strasburg, 1882–88). They were written between the middle of the 13th and the middle of the 14th century, and run to enormous length, the separate cycles or groupings of the episodes being called 'branches.' Méon's work includes three cycles: (1) *Roman du Renart*, apparently the work of three if not more authors, Pierre de St Cloud, a priest of Lacroix in Brie, and a Norman priest Robert de Lison; (2) *Le Couronnement de Renart*, attributed to Marie de France; and (3) *Renart le Nouvel*, by Jacquemars Gielée of Lille, about 1290. The last two are transparent satires upon certain of the monastic orders. There is a fourth cycle, a voluminous compilation or imitation by a priest of the neighbourhood of Troyes, made near the middle of the 14th century, and entitled *Le Renart Contrefait* (ed. F. Wolf, Vienna, 1861). The oldest extant High German version, *Reinhart Vuhs* or *Fuchs* (ed. Reissenberger, Halle, 1886), more usually called *Reineke Fuchs*, was adapted by some one unknown, early in the 13th century, from a still older version, *Isengrimes Nôt*, itself a translation made from old French sources about 1180 by an Alsatian, Heinrich der Glichesaere. The Flemish version which has been the basis of most of the translations, continuations, and editions that have been made since the invention of printing is entitled *Reinaert de Vos* (ed. Martin, Paderborn, 1874). It was written by one William, but whether William de Matoc, William Utenhove, or more probably an unknown William, is uncertain, and dates apparently from the middle of the 13th century. The source upon which it is built is the nineteenth 'branch' in the *Roman de Renart* (last in vol. i. of Méon). The text that has been almost exclusively used in the later translations, &c., is that of a second edition, deviating in some respects from William's own, notably in the infusion of a didactic, satirical tendency; the author of this second edition is not known. It was from a prose version of this second edition, published at Gonda in 1479, that Caxton made his translation of *The History of Reynard the Fox* (1481; reprinted Edin. 1884). Upon this same edition was based the Low German version, *Reinke de Vos* (ed. Prien, Halle, 1887), which has been more often translated perhaps than any other version. Who the Low German translator was is not known, in spite of the question having greatly exercised many specialists. The *editio princeps* of *Reinke* is that of Lübeck (1498), and next to it stands that of Rostock (1517). There are Danish (by A. H. Weigere, Lübeck, 1555), Swedish (Stockholm, 1621), and several other High and Low German editions, for which, however, see the bibliography prefixed to Prien's *Reinke*. Nevertheless special mention must be made of Gottsched's High German prose version (1752) and Goethe's well-known High German poem, with Kaulbach's scarcely less known illustrations to the same. Popular High German translations are contained in Simrock's *Deutsche Volksbücher* (vol. i. 1845) and Marbach's *Volksbücher* (vols. xv.–xvii.).

The outline of the story, according to the Flemish *Reinaert*, is as follows: Nobel the Lion, king of animals, was holding court one Easter-tide. All the animals, great and small, came and paid homage to him except Reynard the Fox. Several amongst them complained of the knaveries of Reynard, the loudest being Isengrim the Wolf, Reynard's old comrade and enemy. He was followed by Tibert the Cat and Pancer the Horse; but Grimbart the Badger spoke up for his uncle Reynard. Then came Chanticleer the Cock, bringing his dead daughter slain by Reynard. For this and his other misdeeds the Fox shall, it is resolved, be cited to appear before the Lion and be tried. Bruin the Bear is sent to summon him. Reynard received him with soft words, told him of some honey hidden in a split tree, and contrived to get Bruin caught fast in the cleft of the tree; there the peasants found him and nearly beat him to death, but at last he got away and went back to court. The next messenger sent was Tibert the Cat. Him, however, Reynard persuaded to catch mice in a place where a noose hung, in which the Cat got caught; and he too was terribly beaten before he got away. At last Grimbart the Badger offered to undertake the office of messenger; and he persuaded Reynard to go with him to court. On the way the Fox makes a sort of private confession of his rascalities and misdeeds to his relative the Badger, especially of the tricks he has played off upon the Wolf. The animals again came forward with their accusations. Reynard defended himself, but was condemned to death. As he was about to be hanged on the gallows, he begged leave to make a public confession of his evil deeds. In the course of his speech he dropped a hint that he knew where an immense treasure was hidden, and then, at the Lion's request, tells all about it. His father, old Reynard, and Isengrim the Wolf, and Bruin the Bear had conspired together to slay the Lion and make Bruin king in his stead; but he (Reynard) had stolen their treasure, with which they thought to hire soldiers, and had gone and hidden it. He could not suffer the noble Lion to be slain and the wicked Bear to be made king in his place. The Lion thereupon pardoned him, and caused Bruin and Isengrim to be seized and evilly entreated. But when he asked Reynard to go and show him where the treasure was, Reynard excused himself, saying he was under an oath to make a pilgrimage to Rome. The Lion then let him go; and Reynard, taking with him Cuwaert the Hare and Belin the Ram, set out on his pilgrimage. On the way he passed his own home, and induced Cuwaert to go into the house with him, and there killed him. And he put his head in a satchel (made from the skin of the Bear) and gave it to Belin, and bade him carry it back to the Lion, telling him it contained valuable letters. When the Lion saw Cuwaert's head he was exceeding wroth, and bade them let the Wolf

and the Bear go free out of prison; and he gave the Ram into their power, and decreed Reynard to be an outlaw.

To this the Low German version adds a continuation, partly a repetition of the same incidents under disguise and partly an actual continuation of the story, ending in a single combat between the Fox and the Wolf, in which the former by trickery beat his antagonist. Finally he returned to his own home, honoured with the favour and protection of the Lion.

English readers should consult the Introduction to W. J. Thoms' edition of Caxton's *Reynard* (1845), Carlyle's *Miscellaneous Essays* (not quite accurate), and F. S. Ellis's *History of Reynard the Fox* (1894). See also L. Sudre, *Les Sources du Roman de Renart* (1893).

Reynolds, John Fulton, an American general, was born in Lancaster, Pennsylvania, 20th September 1820, graduated at West Point in 1841, and became commandant there in 1859. As brigadier-general he fought at Mechanicsville and Gaines's Mills, and was taken prisoner at Glendale, but exchanged in August 1862. At the second battle of Bull Run his own bravery induced his brigade to stand fast, and so prevented a complete rout. In November he was commissioned major-general, and in 1863 commanded a corps at Fredericksburg. He was killed at Gettysburg, where he commanded the left wing, on 1st July 1863. The state erected a granite shaft on the spot where he fell, and his men a bronze heroic statue on the field; and in 1884 an equestrian statue was unveiled in Philadelphia.

Reynolds, Sir Joshua, P.R.A., portrait and subject painter, was born at Plympton Earls, near Plymouth, on 16th July 1723, the year of Kneller's death. His father, a clergyman and master of Plympton grammar-school, intended him for the medical profession; but he developed a strong aptitude for painting, was continually studying the plates in Cats's *Book of Emblems*, Dryden's *Plutarch*, and the other volumes that came in his way, and at the age of eight had mastered the *Jesuit's Perspective*, and applied its principles to drawings executed by himself. In October 1740, accordingly, he was sent to London to study art, and placed in the studio of Thomas Hudson, a portrait-painter, of very moderate abilities, much employed at the time. In 1743 he returned to Devonshire, and some of the portraits of local worthies which he then produced still exist. In the following year he was again in London pursuing his art; but in the beginning of 1747, after the death of his father, he settled in Plymouth Dock, now Devonport, where he learned much from a study of the works of William Gandy of Exeter. In 1749 he made the acquaintance of Commodore, afterwards Lord, Keppel, who invited him to accompany him on a cruise in the Mediterranean; and, after painting many of the British officers in Minorca, he made his way to Rome, where he studied Raphael and Michael Angelo, and in the Vatican caught a chill which permanently affected his hearing, and necessitated his use of an ear-trumpet during the rest of his life. He also visited Bologna, Genoa, Florence, Parma, and Venice. Returning to England in October 1752, he soon afterwards established himself in a studio in St Martin's Lane, London, and attracted notice by his portraits of the second Duke of Devonshire and Commodore Keppel. Before long he was in excellent practice, and in the year 1755 he had no fewer than a hundred and twenty sitters, of whom he produced portraits in which the influence of the Italian masters, and especially of Correggio, is clearly visible; works in which he was certainly aided by such assistants as Marchi, but which he impressed with his own character and individuality. He soon removed to Great Newport Street; and finally, in 1760, he purchased a mansion on the west side of Leicester Square, to which he added a studio and reception-room.

He was now at the height of his fame, and a valued friend of his most celebrated contemporaries. In 1764 he founded the famous literary club of which Dr Johnson, Garrick, Burke, Goldsmith, Boswell, and Sheridan were members; all of whom were portrayed by his brush. He was one of the earliest members of the Incorporated Society of Artists, and contributed to its exhibitions till 1768, when, on the establishment of the Royal Academy, he was elected its first president; and in the following year he received the honour of knighthood from the king. In 1769 he delivered the first of his Discourses to the students of the Academy, fifteen of which have been published. They are full of valuable and well-considered instruction, and, along with his papers on art in the *Idler*, his annotations to Du Fresnoy's *Art of Painting*, and his *Notes on the Art of the Low Countries* (the result of a visit to Belgium and Holland in 1781), show a correct and cultivated literary style. He contributed his picture of Miss Morris as 'Hope nursing Love' to the first exhibition of the Royal Academy, along with his portraits of the Duchess of Manchester, Mrs Blake, Mrs Crewe, and Mrs Bouverie; and in 1771 completed his subject of 'Count Ugolino and his Children in the Dungeon,' usually regarded as his most successful effort in the direction of historical art. In 1784 he succeeded Allan Ramsay as painter to the king; in the same year he finished and exhibited his portrait of Mrs Siddons as the 'Tragic Muse,' in the possession of the Duke of Westminster, undoubtedly his greatest portrait, a work existing in several versions, of which one is in the Dulwich Gallery; and in 1787 he undertook three subjects for Boydell's Shakespeare Gallery, executing 'Puck,' 'The Witch Scene from Macbeth,' and 'The Death of Cardinal Beaufort.'

Hitherto he had devoted himself with little interruption to his art, having speedily recovered from a slight attack of paralysis from which he suffered in 1782; but in July 1789 his sight became affected, and he ceased to paint, though he was still able to enjoy intercourse with his friends. The following year was embittered by an unfortunate dispute with the Academy regarding the appointment of a professor of Perspective, which led to his resignation of the presidentship, a resolution which he afterwards reconsidered and rescinded; and on the 10th of December 1790 he delivered his last Discourse to the students. Gradually his strength sank—for, unknown to his physicians, he was suffering from a painful form of liver complaint—and he peacefully expired on the 23d February 1792.

It is in virtue of his portraits that Reynolds ranks as the head of the English school of art. In the dignity of their style, the power and expressiveness of their handling, the variety and appropriateness of their attitudes, in the beauty of their colouring and the delicacy of their flesh-painting, his portraits have never been surpassed. He was at home alike in portraying the strength of manhood and the grace of the gentler sex; and his pictures of children have an especial tenderness and beauty which have given a world-wide celebrity to works like 'Master Bunbury,' 'The Strawberry Girl,' and 'Simplicity.' His efforts in the higher departments of historical and imaginative art were less successful, and too often these can be regarded only as among the failures of a great artist. In his technical methods Reynolds was unfortunately most careless and uncertain. He was continually experimenting in new processes

and untried combinations of pigments, with the result that even in his own lifetime his works deteriorated, especially in their flesh-tints.

Personally Reynolds was a man of fine and varied culture, and he was distinguished by an exquisite urbanity, the expression of a most amiable and equable disposition, which was exceptionally fitted to win and retain friendship. His dignified gentleness, his mild reasonableness, tamed even the fierceness of Dr Johnson; and there was more of truth than is usual in poetic panegyric in the lines of Goldsmith which speak of this painter as

> Still born to improve us in every part,
> His pencil our faces, his manners our heart.

The first great collection of the works of Reynolds was brought together by the British Institution in 1813, and numbered 142 pictures; another gathering was formed by the same body in 1823; 154 examples of his art were included in the South Kensington Portrait Exhibition of 1867; and 231 were exhibited in the Grosvenor Gallery in 1883–84. His authentic works have been estimated by Taylor to number between two and three thousand; and from these some 700 engravings have been executed, some of them—such as the mezzotints of J. R. Smith, John Dixon, William Dickinson, Valentine Green, and James M'Ardell—ranking among the finest examples of the art.

Conway, *Artistic Development of Reynolds and Gainsborough* (1886); and the monograph by Claude Phillips (1894).

Rhabdomancy. See DIVINATION, DIVINING ROD.

Rhadamanthus, in Greek Mythology, the son of Zeus and Europa, and brother of Minos of Crete. He settled in Bœotia, where he married Alcmene. So great was his reputation during life for the exercise of justice that after death he was appointed a judge in the under-world, along with Minos and Æacus.

Rhætia, an ancient Roman province embracing a large part of the Alpine tract between the basins of the Po and the Danube, now included in the Grisons and the Austrian Tyrol. Its inhabitants were brave and turbulent, and were only subdued by Drusus and Tiberius after a desperate resistance. The province was then formed, to which Vindelicia was soon added; but later Rhætia was subdivided into Rhætia Prima and Rhætia Secunda (Vindelicia). The only important town in Rhætia was Tridentinum (*Trent*); the colony of Augusta Vindelicorum (*Augsburg*) was in its northern part. —For Rhætic Beds, see TRIASSIC SYSTEM.

Rhamnaceæ (*Buckthorns*), a natural order of exogenous plants, consisting of trees or shrubs; often spiny; with simple, generally alternate leaves, and stipules minute or wanting. This order contains about 250 known species, natives of temperate and tropical countries, and very generally distributed over the globe. The prevailing principle in the buckthorns is a bitter extractive which is acrid or astringent, tonic and antifebrile. Some of them are used in dyeing (see BUCKTHORN, and FRENCH BERRIES), some in medicine (see RED ROOT), and the fruit of some is pleasant (see JUJUBE); whilst *Hovenia dulcis*, a native of China and Japan, is remarkable for the thickening of its flower-stalks after flowering, so as to form a succulent sweet red pulp, with a flavour resembling that of a pear. The lotus of the ancient Lotophagi, celebrated by Homer, is the fruit of *Zizyphus lotus*, a small shrub abundant in Spain, Sicily, Barbary, Tunis (see LOTUS). The wood of *Rhamnus frangula* yields a superior charcoal for the manufacture of gunpowder.

Rhampsini'tus, a Grecised form of the Egyptian name Ramses, apparently Ramses III., the builder of the pavilion of Medinet Abu at Thebes. Brugsch makes Rhampsinitos a Greek form of *Ramessu pa nuter* ('Ramses the God'); Maspero, *Ramsis-si-nit* ('Ramses, son of Neith'), a title never borne by the Theban kings, but first used by the Saitic princes, which fixes the date of the tale to the period of Psammetichus and his dynasty. Of him Herodotus (II., 121 *et seq.*) relates a story substantially the same as one of the most widespread folk-tales of the Aryan world. The king acquired an enormous treasure, and to secure it built a treasury of stone. The architect left one stone loose, so nicely adjusted as to be unnoticed, yet capable of being taken out and replaced without difficulty. Before death he entrusts the secret to his two sons, who from time to time plunder the king's treasure at their will, until at length the elder is caught in a snare set by the king. According to his desire, the younger brother cuts off and carries away his head, so that he may remain unknown. The king now orders the headless body to be exposed unburied, protected by a guard of soldiers, but the younger brother lades an ass with skins of wine, allows some of it to run out, and is relieved in his distress by the soldiers, to whom in gratitude he gives his wine so freely that they all sink into a drunken sleep. Thereupon he shaves the right half of all their beards, and carries his brother's body to his mother. The king next sends his daughter to find out the clever thief. She promises her love to those who reveal to her the most extraordinary things that have ever happened to them, and when the young man in his turn relates the strange passages of his life she seizes him; but he cunningly slips his brother's dead hand into hers, and so escapes. The king is so much struck with wonder and admiration that he promises the clever thief his daughter in marriage, since he surpassed all mankind in knowledge; for, while the Egyptians surpassed all the world, he surpassed the Egyptians.

Such is the oldest recorded version of Asbjörnssen's 'Master-thief' and Campbell's 'Shifty-lad,' Dr Barbu Constantinescu's Roumanian gypsy story of 'The Two Thieves,' a variant of the story of Trophonios and Agamedes in the treasury of Hyrieus at Hyria (Paus. ix. 37), of Augeias in Elis, and of Hermes (ἀρχὸς φηλητῶν), as well as of the Hindu legend of Karpara and Gata, or that of Ali Baba and the Forty Thieves in the *Arabian Nights*. The story occurs in the oldest version (12th century) of the romance of the 'Seven Wise Masters,' the *Dolopathos, sive de Rege et Septem Sapientibus*, from which Ser Giovanni probably derived the story as found in his *Pecorone* (written *circa* 1378), where it is related of an architect named Bindo who stole a golden vase from the treasury of the Doge of Venice. It will be found, more or less perfect, in every collection of European folk-tales, whether Norse, Gaelic, modern Greek, French, Breton, Albanian, Sicilian, Hungarian, Dutch, Tyrolese, Danish, or Russian, as well as Kabyl, Mongolian, Tibetan, and Singhalese.

Maspero defends the story as fundamentally Egyptian, or at least Egyptianised long before Herodotus, in spite of the Greek dress in which the historian has clothed it. It has been objected by some that the idea of a movable stone is not Egyptian, and is but ill adapted to the size of the stones used in building; but at Dendera have

been found a series of crypts communicating with the temple by narrow passages formerly opened and closed in a similar manner, the stone sculptured like the rest of the wall. Again, Wilkinson objected that the soldiers wore no beards; but basreliefs and statues show that Egyptians of pure race wore beards according to individual taste; and besides the soldiers of police in question belonged to a tribe of Libyan origin, named Maziou, who usually wore the beard.

See Liebrecht's translation (1851) of Dunlop's *History of Prose Fiction*; A. Schiefner in vol. xiv. of the *Bulletin* of the St Petersburg Academy of Sciences; W. A. Clouston's *Popular Tales and Fictions* (1887); and Maspero's *Contes Populaires de l'Égypte Ancienne* (2d ed. 1889).

Rhapsodists (Gr., from *rhaptein*, 'to stitch together,' and *ōidē*, 'an ode'), a class of men in ancient Greece who travelled from place to place reciting poetry. They are distinct from the professional minstrels (*aoidoi*) of the *Odyssey*, although their legitimate successors; but they also seem, at first at least, to have been composers of epic poetry, although it is hardly probable that this was often the case after the 6th century B.C. We find distinct traces of the public recitation by rhapsodists of the Homeric poems as early as 600 B.C., at places so far apart as Sicyon, Syracuse, Delos, Chios, Cyprus, and Athens. Indeed at Athens ancient law prescribed the recitation of Homer once every four years at the festival of the Great Panathenæa. To the early rhapsodists mainly belongs the credit of the wide diffusion of the Homeric poems throughout the Greek world. They themselves were held in high esteem and richly rewarded; but in later days the art came to be practised in a mere mechanical manner, and the influence of the rhapsodists ebbed accordingly. In Plato's *Ion* we get a picture of the rhapsodist as he was about the middle of the 4th century B.C. Ion is a native of Ephesus who goes from city to city reciting Homer to crowds of hearers, appearing on a platform in a richly-embroidered dress, a golden wreath on his head. He adds dramatic force to his declamation, and brings Homer home to his hearers' hearts, being himself *possessed* by Homer. Moreover, he interprets Homer in a continuous exposition, and is proud of his fluency of ideas. Ion is described as devoted exclusively to Homer, but there were a few of his brethren who gave themselves also to Orpheus, Musæus, Hesiod, Archilochus, or Simonides. It is unlikely that Homer was ever sung to music, although in earlier times there were heroic lays which were sung to the accompaniment of the lyre. As lyric poetry became more distinctly cultivated, such epic lays came to be simply declaimed, the rhapsodist holding a branch of bay in his hand instead of a lyre.

Rhatany, or RATTANY, a half-shrubby plant, of the natural order Polygaleæ, a native of the cold sterile tablelands of the Andes in Peru and Bolivia. It is called *Ratanhia* in Peru. It is valued for the medicinal properties of the root, which are shared more or less by other species of the same genus, also natives of South America. In the British Pharmacopœia the dried roots of two species (*Krameria triandra*, Peruvian Rhatany, and *K. ixina*, Savanilla Rhatany) are officinal under the name Krameriæ Radix. The roots vary a good deal in size and thickness, but are always rough-looking, and reddish in colour. The bark has a strongly astringent taste, and when chewed tinges the saliva red; the wood is nearly tasteless. The dried root is a powerful astringent, and is employed in diarrhœa, mucous discharges, passive hæmorrhages, and cases where an astringent or styptic action is indicated. The finely-powdered root is also a frequent constituent of tooth-powders. Rhatany root is imported from various parts of South America, but chiefly from Lima. It is extensively imported into Portugal in order to communicate a rich red colour to wines. Its peculiar properties are due to rhatany-tannic acid, found in the root-bark to the extent of 20 per cent.; it also contains a red colouring matter.

Rhazes, or RĀZI, Persian physician and alchemist. See MEDICINE (p. 117) and ARABIA (p. 366).

Rhé, ILE DE. See RÉ.

Rhea, an ancient Cretan earth-goddess, daughter of Uranus and Gæa, wife of her brother the Titan Cronus, and by him mother of the Olympian deities Zeus, Hades, Poseidon, Hera, Hestia, Demeter. She was early identified with the Asiatic nature-goddess Cybele, the Great Mother, who was worshipped on mountains in Mysia, Lydia, and Phrygia. Her Cretan *Curetes* corresponded to the Phrygian *Corybantes*, many of whom mutilated themselves like Attis in the frenzy of their orgies. The regular priests of Cybele, the Galli, made themselves eunuchs for conscience' sake. A Sibylline oracle decreed the introduction of the worship of the Great Mother at Rome in 204 B.C., and in 217 a temple was dedicated on the Palatine. The cult became widely extended under the Empire. In the 2d century A.D. the rites of the *Taurobolia* and *Criobolia* were added, in which candidates were baptised for purification and regeneration with the blood of sacrificial bulls and rams. See the article CYBELE.—RHEA SYLVIA was the mother of Romulus (q.v.).

Rhea, also called Nandu and American Ostrich, a genus of South American birds, which form, according to the most recent researches, a somewhat isolated group, though nearer to the ostriches than to any other birds. They are incapable of flight, but the wings are rather better developed than in any other of the so-called 'Struthious' birds; they present an interesting archaic character in the persistence of a claw upon each of the three digits, thus recalling very forcibly the origin of the wing from a prehensile forelimb. As in the ostrich and the apteryx, the feathers have no aftershaft, and the colour of the eggs is white. The male bird incubates. There are three distinct species—viz. *R. americana*, *R. macrorhyncha*, and *R. Darwini*, which are to be distinguished by their geographical range as well as by external and internal differences of structure. The first-named species inhabits the southern half of the continent. *R. macrorhyncha*, which is darker coloured, especially on the head, is found in north-east Brazil. *R. Darwini*, in which most of the feathers have white tips, is found in south-eastern South America. They all prefer grassy plains (*campos*), herd in troops, and run with great rapidity.

Rhea Fibre. See BŒHMERIA.

Rhegium. See REGGIO.

Rheims, or REIMS, a city in the French department of Marne, situated on the Vesle (a tributary of the Aisne), 100 miles ENE. of Paris by rail. Strongly fortified with detached forts since the Franco-German war, when it was for a time the German headquarters, it is well built, and from the material employed in building, which is the chalkstone of the district, and from the prevalence of the older style of domestic architecture, has a picturesque appearance. It is built on the site of *Durocortorum*, which is mentioned by Cæsar as the capital of the Remi, from which people it subsequently took its present name. Christianity may have found an entrance into Rheims at an earlier period, but it was not till about 360 that it became a bishop's see. Under the Frank rule it was a place of much importance, and it acquired a deeply religious

interest from its having been the scene in 496 of the baptism of Clovis and his chief officers by the bishop, St Remy (*c.* 438–533). In the 8th century it became an archbishopric, and from 1179, when Philip Augustus was solemnly crowned here, it became the place for the coronation of the kings of France, who were anointed from a vessel of sacred oil, called the *Sainte Ampoule*, which a dove was said to have carried to St Remy from heaven. Joan of Arc brought the dauphin hither, and the only sovereigns in the long series, down to 1825, not crowned at Rheims were Henry IV., Napoleon I., and Louis XVIII. In 1793 the cathedral was attacked by the populace, and the sainte ampoule smashed by a sans-culotte; and in 1830 the ceremony of coronation at Rheims was abolished. The cathedral, although the towers of the original design are still unfinished, is one of the finest extant specimens of Gothic architecture. It was built between 1212 and 1430, and in 1877 the government voted £80,000 towards restoration. Its nave is 466 feet long by 99 in breadth, with a transept of 160 feet, and the height is 144 feet. Its grandest features are the west façade, which is almost unrivalled, with its magnificent doorway (figured in Vol. IV. p. 59), and the so-called Angel Tower, which rises 59 feet above the lofty roof. The stained glass is remarkable for its beauty; the organ is one of the finest in France; and two survive out of six magnificent tapestries. The Romanesque church of St Remy (mainly 1160–80), with the saint's shrine, is nearly of equal size, but of less architectural pretension. Also noteworthy are the hôtel-de-ville (1627–1880); the ancient 'Maison des Musiciens' and archiepiscopal palace; the Porta Martis, a Roman triumphal arch; the Lycée, representing a former university (1547–1793); and statues of Louis XV. and two natives, Colbert and Marshal Drouet. Rheims is one of the principal entrepôts for the wines of Champagne (q.v.), and the hills which surround the town are planted with vineyards. It is one of the great centres of the woollen manufacture in France, and its manufactures, embracing woollen goods (especially merinoes), mixed fabrics in silk and wool, &c., are known in commerce as *Articles de Reims*. Pop. (1872) 71,397; (1891) 101,699. See the article DOUAY; and Justinus, *Rheims, la ville des sacres* (1860).

Rheingau, a district, 14 miles long, stretching along the right bank of the Rhine, from opposite Mainz to the village of Lorch, 8 miles below Bingen, formerly belonged to the archbishopric of Mainz, and now forms part of the administrative district of Wiesbaden in Prussia. Protected by mountains from the north and east winds, and exposed to the mid-day sun, the Rheingau produces wines of the best quality, as Johannisberger, Rüdesheimer, Marcobrunner, Assmanshäuser, &c.

Rhenish Architecture, the style of the countries bordering on the Rhine when the arts first revived after the fall of the Roman empire. They and Lombardy being at the time of Charlemagne part of the same empire, Lombard Architecture (q.v.) has considerable affinity with those north of the Alps. Some very early examples of this style are still to be found in Switzerland. Architecture received great encouragement from Charlemagne and his successors, and the Rhenish style made great progress up to the beginning of the 13th century, when the fashion of copying the Gothic architecture of France superseded it. It is, however, a well-marked style, and is complete and perfect in itself. Like the Lombard style, it is round-arched, and has some remarkable peculiarities. Many of the earliest churches seem to have been circular (like the cathedral at Aix-la-Chapelle, built by Charlemagne), but in course of time the circular church was absorbed into the Basilica, or rectangular church (see ROMANESQUE ARCHITECTURE), in the form of a *western* apse. Most German churches thus have *two apses*—an eastern and a western. They also have a number of small circular or octagonal towers, which seem to be similar in origin to the Round Towers of Ireland. They exemplify in a remarkable manner the arrangements of an ancient plan of the 9th century, found in the monastery of St Gall, and supposed to have been sent to the abbot, as a design for a perfect monastery, to aid him in carrying out his new buildings. The arcaded galleries at the eaves, and the richly-carved capitals, are among the most beautiful features of the style. Examples are very numerous from about 1000 to 1200 A.D. The three great specimens of the style are the cathedrals of Mainz, Worms, and Spires. The last is a magnificent building, 435 feet long by 125 feet wide, with a nave 45 feet wide, and 105 feet high. It is grand and simple, and one of the

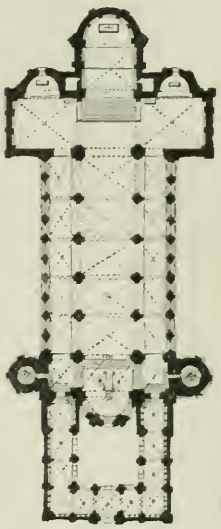


Fig. 1.—Plan of Church at Laach.

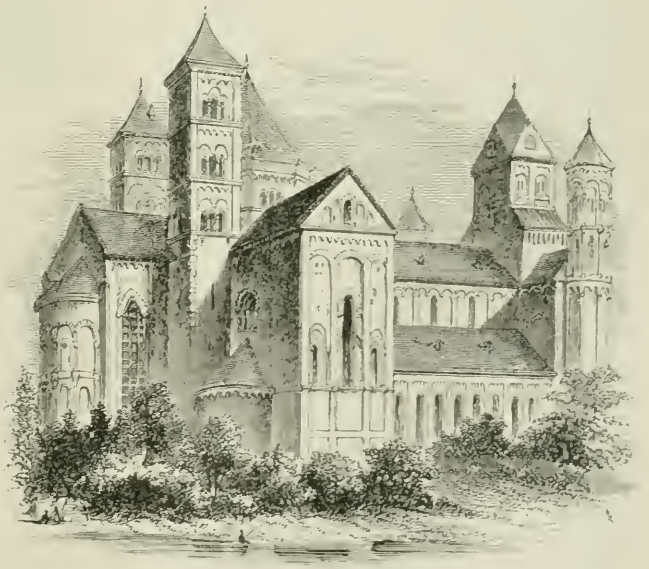

Fig. 2.—Elevation of Church at Laach.

most impressive buildings in existence. There are also numerous fine examples of the style at Cologne —the Apostles' Church, St Maria im Capitol, and St Martin's being amongst the most finished examples of Rhenish architecture. The illustrations of the famous church of the Benedictine abbey at Laach, near Coblenz, explain the peculiarities of plan and elevation above referred to. The vaults in this case being small, the different spans were managed (although with round arches) by stilting the springing; but in great buildings like Spires and Worms the vaults are necessarily square in plan, in this round-arched style, and the nave embraces in each of its bays two arches of the side aisles—a method also followed by the early Gothic architects. From the use of the round arch and solid walls, the exteriors are free from the great mass of buttresses used in Gothic buildings, and the real forms are distinctly seen (see APSE).

Rhenish Prussia (Ger. *Rheinprovinz, Rheinland*, or *Rheinpreussen*), the most western and most thickly peopled of the provinces of Prussia, lies on both sides of the Rhine and the Lower Moselle, and is bounded on the W. by Luxemburg, Belgium, and the Netherlands. Long and narrow, it extends from Cleves in the north to Saargemünd in the south, has Cologne near the middle of its area, Aix-la-Chapelle (Aachen) and Treves near its western boundary, and Coblenz (the capital), Elberfeld-Barmen, and Essen near its eastern boundary, whilst Bonn lies south-east of Cologne, and Düsseldorf and Crefeld N. by W. of it. Area, 10,419 sq. m.; pop. (1885) 4,344,527; (1890) 4,710,313, of whom about 3,400,000 are Roman Catholics, and 10,000 Walloons. The surface is everywhere more or less mountainous, except in the extreme north, reaching 2500 feet on the west of the Rhine, but only 1800 on the east side. The soil of the higher tracts is not very fertile, and is largely forest land; but the valleys of the Rhine, Moselle, and Nahe are very fruitful, and so are the flat districts in the north. Of the total area, 64 per cent. is cultivated, including meadows and vineyards, and nearly 31 per cent. under forest. Grain, potatoes, beet-root, tobacco, hops, flax, &c. are the more important crops. Much wine and large quantities of vegetables are grown. More than sixteen million tons of coal are mined in the year, also large quantities of iron, zinc, and lead ore. The sulphur-springs of Aix-la-Chapelle and Burtscheid have a European reputation. Industry and manufactures are prosecuted with the greatest energy and success, this province ranking first in all Prussia in this respect. Iron, lead, zinc, and sulphuric acid (at Essen, Solingen, Remscheid, &c.); cloth and buckskin (Aix-la-Chapelle and Burtscheid); silk, velvet, and similar wares (Crefeld, Elberfeld-Barmen, Mülheim), cottons (Cologne, München-Gladbach, and Elberfeld-Barmen), linen (Gladbach and Neuss), leather (Malmedy), glass and pottery, paper, chemicals (Duisburg, Aix-la-Chapelle), soap, sugar, beer, spirits, and perfume (eau de Cologne) are all manufactured on a large scale. There is a university at Bonn. This province was formed in 1815 out of the duchies of Cleves, Jülich (Juliers), Guelders, and Berg, and numerous minor territories. It is defended by the four fortresses of Cologne, Coblenz (Ehrenbreitstein), Wesel, and Saarlouis.

Rheostat, the name given by Wheatstone to an instrument for varying an electric resistance between given limits. Many forms have been suggested and used by Pouillet, Jacobi, Poggendorff, Wheatstone, and others. The most serviceable is perhaps Sir W. Thomson's modification of Wheatstone's double-cylinder rheostat. In it a platinum or platinoid wire is wound round two parallel cylinders, one of which is metal and the other of some insulating material. In any position the part of the wire which is effective as a resistance is the part that is on the insulating cylinder up to where it comes in contact with the metal cylinder. By means of a gearing of toothed wheels and screw shaft the two cylinders are turned simultaneously in one or the other direction, while at the same time a nut travels to or fro and guides the wire as it leaves the one cylinder and coils itself round the other. See ELECTRICITY.

Rhesus Monkey, or BOONDER (*Macacus rhesus*), a widely distributed and common Indian monkey. Like the Entellus (q.v.) or Hanumân, it is in part migratory, visiting the Himalayas in summer, and sometimes found at a level of 8000 feet. The body is stout, the limbs are strong, the skin hangs in loose folds about the neck, breast, and abdomen. The hair is grayish or brownish on the back and lighter beneath; the naked parts are copper-coloured; the large ischial callosities are bright red. It is a very intelligent and mischievous monkey, and readily tamed when young. It is

Rhesus Monkey (*Macacus rhesus*).

held in almost as great veneration by the natives of India as the Hanumân itself; and the killing of one of these animals is apt to arouse the greatest popular indignation. The monkeys live in troops in the forests, chiefly in hilly districts, and visit the cultivated grounds to carry away grain and other produce, which they store up for themselves among rocks. The native farmers leave a share for the monkeys, believing this to be necessary to avert their anger, as otherwise they would next year destroy the whole crop whilst green.

Rhetoric (Gr. *rhētorikē*) in its broadest sense may be regarded as the theory and practice of eloquence, whether spoken or written. It aims at expounding the rules which should govern all prose composition or speech designed to influence the judgments or the feelings of men, and therefore treats of everything that relates to beauty or force of style, such as accuracy of expression, the structure of periods, and figures of speech. But in a narrower sense rhetoric concerns itself with a consideration of the fundamental principles according to which particular discourses of an oratorical kind are composed. The first to reduce oratory to a system were the Sicilian Greeks; its actual founder is said to have been Corax of Syracuse (*c.* 500 B.C.). He divided the speech into five parts, proem, narrative, arguments, subsidiary remarks, and

peroration; and he laid great stress on the rhetorical capabilities of general probability. Later masters of rhetoric were Tisias; Gorgias of Leontini, whose style was burdened with too much ornament and antithesis; Antiphon, the earliest of the so-called 'Ten Attic Orators,' and the first writer of speeches for others to deliver in court. The speeches given by his great pupil Thucydides throughout his history, and the orations of Andocides, second of the Ten, are severely free from the florid ornament of later days. Lysias was an orator rather than a rhetorician; Isocrates first thoroughly taught rhetoric, which he defined as the 'science of persuasion,' as a technical method and discipline. His most celebrated pupils were Hyperides, Speusippus, and Isæus. The great Demosthenes was a pupil of the last. His opponent Æschines, and his contemporaries Hyperides, Lycurgus, and Dinarchus complete the Ten. Anaximenes of Lampsacus composed the oldest extant manual of rhetoric, but the great classical work on this subject is the analytical masterpiece of Aristotle. According to him its function is not to persuade, but to discover the available means of persuasion in any subject. He regards it as the counterpart of logic, and arranges its uses as (1) the means by which truth and justice assert their superiority to falsehood and injustice; (2) the only method of persuasion suitable to popular audiences; (3) a means of seeing both sides of a case and of discerning the weakness of an adversary's argument; (4) as a means of self-defence. The means of persuasion he groups in two classes: (1) the inartificial proofs, such as statements of witnesses, contracts, and the like; (2) the artificial proofs, whether these are (*a*) *logical*, demonstration or seeming demonstration by argument; (*b*) *ethical*, when the speaker induces confidence by the weight of his own character; or (*c*) *emotional*, when he works persuasively on the feelings of his hearers.

Of these artificial proofs, first comes the *logical*, and this depends on the *enthymeme*, 'a syllogism from probabilities' and signs; next is the example. Of the materials of enthymemes, the topics or commonplaces of rhetoric, Aristotle distinguishes between the *common*, general heads applicable to all subjects as to their possibility or impossibility, and the *special*, those drawn from special arts or faculties.

He divides the three provinces of rhetoric thus: (1) *Deliberative* rhetoric, concerned with exhortation or dissuasion, and future time, its ends expediency and inexpediency; (2) *Forensic* rhetoric, concerned with accusation or defence, and with time past, its ends justice and injustice; (3) *Epideictic* rhetoric, concerned with eulogy or censure, and usually with time present, its ends being honour and disgrace, or nobleness and shamefulness. In his first two books Aristotle deals with *invention*, the discovery of means of persuasion; in the third, with *expression* and *arrangement;* and he begins the subject by discussing the art of *declamation* or *delivery*. Under verbal expressions he discusses the use of metaphor, simile, proverbs, rhythm, and variety of styles, as the *literary* and *controversial*, whether the *political* or the *forensic*.

Aristotle's method dominated the Peripatetic school, but later began to be modified by the florid influence of Asia, the originator of which was Hegesias of Magnesia. The school of Rhodes followed more closely Attic models, and gained great fame through its conspicuous leaders Apollonius and Molon (*c.* 100–50 B.C.). Hermagoras of Temnos (*c.* 120 B.C.) composed an elaborate system which long retained its influence. Later rhetoricians were Dionysius of Halicarnassus, Longinus, Hermogenes, Apsines, Menander, Theon, and Aphthonius. Among the earliest Roman orators were Appius Claudius Cæcus (*c.* 300 B.C.), Cato the Censor, Ser. Sulpicius Galba, Caius Gracchus, Marcus Antonius, and Lucius Licinius Crassus. The instructors in formal rhetoric were Greek, and the great masters of theoretical and practical rhetoric alike, Cicero and Quintilian, were both formed by Greek models. The former contributed to a discussion of its theories no less than three treatises, *De Oratore*, the *Brutus*, and the *Orator;* the latter's famous *Institutio Oratoria* still retains its value. Quintilian strove hard to reform the taste of the time, which had become Asiatic through exclusive attention to the form and perpetual exercises in the schools on imaginary subjects—the *suasoriæ* and *controversiæ* of the elder Seneca. The *Dialogus de Oratoribus*, long ascribed to Tacitus, was another protest against modern fashion. The younger Pliny's *Panegyric* long remained a model for later orators. During the first four centuries of the empire rhetoric continued to be taught by 'sophists' at Athens, Smyrna, Rhodes, Tarsus, Antioch, Alexandria, and Massilia. These were in most esteem under Hadrian, the Antonines, and Marcus Aurelius—among the most celebrated were Theodotus, Polemon, and Adrian of Tyre. Throughout the middle ages rhetoric formed one of the subjects of the *trivium;* its leading authorities were Martianus Capella, Cassiodorus, and Isidorus. The subject re-awoke with the revival of learning, and was taught regularly in the universities, the prescribed public exercises and disputations keeping it long alive; but in later generations it has constantly languished, in spite of more or less laborious or effective attempts to fan it into life by the sententious Blair, the solid Campbell, and the sagacious Whately. In America, however, considerable attention is paid to it as a branch of general education.

See Aristotle's *Rhetoric*, with notes by E. M. Cope and J. E. Sandys (3 vols. 1877), the Introduction and Analysis by E. M. Cope (1867), and Translation by J. E. C. Welldon (1886); C. Ritter, *Die Quintilianische Declamationen* (1881); R. Volkmann, *Die Rhetorik d. Griechen u. Römer* (1872); Book iv. of St Augustine's treatise *On Christian Doctrine;* and J. Bascom's *Philosophy of Rhetoric* (New York, new ed. 1885). For the practical art of Rhetoric or Oratory, see M. Bautin, *Art of Extempore Speaking* (1858); the Abbé M. Delaumosne, *Art of Oratory:* system of Delsarte, trans. F. A. Shaw (Albany, 1882); Professor J. H. M'Ilvaine, *Elocution: the Sources and Elements of its Power* (1870); V. A. Raymond, *The Orator's Manual: Vocal Culture, Emphasis, and Gesture* (Chicago, 1879); and C. W. Bardeen, *Rhetoric* (New York, 1884).

Rheumatism (from the Gr. *rheuma*, 'a flux') is a term which has been, and still is, rather vaguely and extensively used in the nomenclature of disease. But there is one very definite affection to which it is always applied; after this has been discussed the other senses in which it is used will be considered.

Acute rheumatism or *rheumatic fever* is indicated by general febrile symptoms, with redness, heat, swelling, and usually very intense pain, in and around one or more (generally several, either simultaneously or in succession) of the larger joints, and the disease shows a tendency to shift from joint to joint or to certain internal serous membranes, especially the pericardium and the endocardium; rheumatism being the most common origin of pericarditis, as has been already shown in the article on that disease. The pulse is strong and full, there is headache, but seldom delirium, unless in very severe cases; the tongue is covered with a creamy thick fur, the tip and edges being red; the urine is turbid, and abnormally acid; and the skin

is bathed in a copious perspiration, with so characteristic a smell (resembling that of sour milk) that the physician can often recognise the disease almost before he sees the patient. The joints are extremely painful, and the pain is much increased by pressure, and consequently by movement which gives rise to internal pressure. Hence the patient lies fixed in one position from which he dares not stir.

The usual exciting cause of acute rheumatism is exposure to cold, and especially to cold combined with moisture, and hence the greater prevalence of this disease amongst the poor and ill-clad. Sleeping in damp sheets or upon the damp ground, the wearing of wet clothes, and sitting in a cold damp room, especially if the sitter was previously warm from exercise, are examples of the kind of exposure which is apt to be followed by this disease. Rheumatism is not, however, a universal sequence to exposure to the cold. It only occurs when there is a special predisposition, or, as it is termed, a rheumatic diathesis or constitution, and the diathesis may be so strongly developed as to occasion an attack of acute rheumatism, independently of exposure to any apparent exciting cause. Acute rheumatism is often associated with Chorea (q.v.); but the exact nature of the relation between the two is not known. Scarlet fever is the only other disease which seems specially liable to be followed by acute rheumatism. Men are more subject to the disease than women, but this probably arises from their greater exposure to atmospheric changes on account of the nature of their occupations. The predisposition is certainly affected by age; children under ten years being comparatively seldom attacked, while the disease is most prevalent between the age of fifteen and forty. Above this age a first attack is rare, and even recurrences are less frequent than earlier in life. Persons once affected become more liable to the complaint than they previously were. The disease is hereditary in a considerable proportion of cases; and even when it cannot be traced in previous generations the predisposition is very apt to exist in several members of the same family. The exact nature of the disease poison is unknown. Dr Prout regarded lactic acid as the actual *materies morbi*, but, though certain facts tend to confirm this view, it cannot be regarded as satisfactorily proved.

In the great majority of cases acute rheumatism ends in recovery; and permanent damage to the affected joints is rare. It is, however, extremely apt to recur, either in the early stages of convalescence, or after an interval of months or years. The chief danger arises from implication of the heart, which very frequently occurs; probably in about one-half of those suffering for the first time either the pericardium or endocardium or both are affected. The younger the patient the greater the liability to these complications, which usually result in more or less permanent impairment of the heart's action (see Heart, Pericardium). Another condition, much less common, but extremely fatal, is known as *rheumatic hyperpyrexia*, and is characterised by a very rapid rise of temperature to 108° or 110°, with head symptoms in the form either of drowsiness or of violent delirium.

The patient should be strictly confined to bed between blankets (i.e. without sheets), and be clothed in flannel; he must be carefully protected from draughts, and from undue pressure of the bedclothes, and supplied with light nourishment and diluent drinks. Under such conditions, without other treatment, most cases recover in the course of time. Till the last quarter of the 19th century there was no general agreement as to what more should be done. When bleeding was used for most acute diseases this one was no exception. When that practice was abandoned numerous drugs were used, in some cases with apparent success. Quinine, iron, lemon juice, colchicum, large blisters to all the affected joints, were all recommended; more in favour than any of these were alkalis in large doses. But in 1876 Stricker in Berlin and Maclagan in England called attention to another method of treatment which is now almost universally adopted. Though new to Europe it has long been in use elsewhere, for the natives of South Africa have from time immemorial treated the disease by willow-top infusion. This method consists in the administration of Salicin (q.v.), or one of its derivatives (salicylic acid, salicylate of soda, &c.). The last is at present most largely used. It is usually given in doses of 15 or 20 grains every two or three hours at first; but its action needs to be carefully watched, as it often causes considerable depression and other uncomfortable symptoms. It is admitted by almost all observers that it has a remarkable effect in reducing the fever, relieving the pains, and cutting short the attack; but under this treatment, as without it, relapses are frequent. In rheumatic hyperpyrexia the only treatment that has been found effectual is immersion in a tepid bath as often as the temperature rises to a dangerous point. Convalescence is usually very slow, and it is necessary to keep the patient in bed and on low diet for some time after the fever has disappeared to diminish the tendency to relapse. At this stage tonics, especially quinine and iron, are generally useful.

Chronic Rheumatism.—Chronic painful affections of the joints sometimes follow rheumatic fever and are clearly a consequence of it. The name is often erroneously applied to chronic and insidious forms of gout. There is another form of disease to which most of the cases of so-called 'chronic rheumatism' belong, probably distinct from both rheumatism and gout, popularly so called, though it is often called 'rheumatic gout,' which deserves separate mention.

Osteo-arthritis (chronic rheumatic arthritis and rheumatoid arthritis are among its many other names) is characterised in most cases by a very chronic course, by pain and stiffness in one or more of the joints, with creaking on movement, and by destructive changes of the cartilages of the affected joints, with enlargement of the ends of the bones in their neighbourhood. It is more common in women than in men; most often begins at or after middle life, though occasionally even in childhood; and is apt to affect those who are weakly and who have had a life of hard work with defective nourishment. There is no special liability to affection of the heart as in true rheumatism. In the treatment of this ailment hot baths and douches, particularly with certain mineral waters (e.g. those of Bath, Aix-les-Bains), and a warm dry climate are very valuable; a generous diet is essential. Of drugs, cod-liver oil and arsenic are most often serviceable; but many others, iron, quinine, guaiacum, &c., are also of use. Under any treatment, however, complete recovery is exceptional; but the disease, even when severe, does not much shorten life.

Gonorrheal rheumatism is a form of joint-disease closely simulating acute rheumatism which occurs in some cases of Gonorrhea (q.v.). The affection does not, however, flit from joint to joint in the same way, and is not amenable to the same treatment.

Muscular rheumatism is the name usually given to painful affections of the muscles for which no clear cause is discoverable; it usually depends either on defective digestion or imperfect excretion of waste products from the system, and eliminant treatment, by alkalis, purgatives, or diaphoretics, is usually indicated. But it is very doubtful whether the cause is the same as in acute rheumatism.

Rheumatic Diseases of Animals.—These are less common than the corresponding affections of men. Horses are not very liable to acute rheumatism, but suffer from a chronic variety, which occurs especially in conjunction with influenza. When affecting the limbs it often exhibits its characteristic tendency to shift from one part to another. In cattle and sheep rheumatic disorders are more common and acute than in horses. The specific inflammation sometimes involves most of the fibrous and fibro-serous textures throughout the body, inducing general stiffness, constipated bowels, and high fever. This is rheumatic fever—the chine-felon or body-garget of the old farriers. Sometimes the disease mainly affects the larger joints, causing intense pain, lameness, and hard swellings; occasionally it is confined to the feet and fetlocks, when it is recognised as bustian-foul. Cattle and sheep on bleak exposed pastures, and cows turned out of the dairy to feed on strong alluvial grazings are especially subject to rheumatism in its several forms. Amongst dogs rheumatism is known under the name of kennel lameness, and is very troublesome and intractable in low, damp, cold situations. Blood-letting is rarely admissible except in the most acute cases amongst cattle. In all animals a laxative should at once be given, with some saline matters and colchicum, and when the pain and fever are great a little tincture of aconite may be added. For cattle a good combination consists of one ounce of nitre, two drachms of powdered colchicum, and two fluid drachms of the Pharmacopœia tincture of aconite, repeated in water or gruel every three hours: half this dose will suffice for horses. With a simple laxative diet dogs should have a pill night and morning containing five grains of nitre and two of colchicum. Comfortable lodgings, a warm bed, horse-rugs on the body, and bandages on the legs will greatly expedite a cure. In chronic cases, or after the more acute symptoms are subdued, an ounce of oil of turpentine and two drachms each of nitre and powdered colchicum should be given for a cow, half that quantity for a horse, and one-fourth for a sheep. Hartshorn and oil, or other stimulating embrocations, diligently and frequently rubbed in, will often abate the pain and swelling of the affected joints.

Rheydt, a town of Rhenish Prussia, 19 miles by rail W. by S. from Düsseldorf, has manufactures of silks, velvets, cottons, machinery, hardware, paper, dyeworks, and breweries. Pop. (1880) 19,087; (1890) 26,962.

Rhime. See Rhyme.

Rhin, Bas and Haut, until 1871 frontier departments of France, corresponded pretty nearly to what are now the two administrative districts of Lower and Upper Alsace, in the German imperial territory of Alsace-Lorraine (q.v.)—Bas Rhin corresponding to Lower Alsace, and Haut Rhin to Upper Alsace. See also Belfort.

Rhine (Ger. *Rhein*, Fr. *Rhin*, Dutch *Rhijn*, Lat. *Rhenus*), in every way one of the most important rivers of Europe. A large number of rivulets, issuing from glaciers, unite to form the young Rhine; but two are recognised as the principal sources—the Nearer and the Farther Rhine. The former emerges on the north-east slope of the Gotthard knot (7690 feet above sea-level), and only a dozen miles from the cradle of the Rhone, on the other side of the same mountain-knot; the Farther Rhine has its origin on the flank of the Rheinwaldhorn (7270 feet), not far from the Pass of Bernardino. The two mountain-torrents meet at Reichenau, 6 miles SW. of Coire (Chur) in the Grisons canton, after they have descended, the Nearer Rhine 5767 feet in 28 miles in a north-east direction, the Farther Rhine 5347 feet in 27 miles along a northerly course. At Coire the united stream strikes due north, and, after ploughing its way for 45 miles between Switzerland and Austrian Vorarlberg, enters its clearing basin, the Lake of Constance (1306 feet above the sea). It leaves this lake at its north-western extremity, a little below Constance, its water a deep transparent green, and flows generally westwards, in three or four wide curves, to Basel, separating Baden on the north from Switzerland on the south. Along this stretch the river (490 feet wide) plunges down the falls of Schaffhausen, nearly 70 feet in three leaps, and races over narrow rapids at three separate places where the terminations of the Jura Mountains intrude into the bed of the river; from the left it receives the waters of the Swiss Aar. Basel is 280 miles distant from the source of the Nearer Rhine following the windings of the channel, but only 85 miles as the crow flies.

At Basel (742 feet) the river, now 225 yards wide, wheels round to the north, and traversing an open shallow valley that separates Alsace and the Bavarian Palatinate from Baden, reaches Mainz (50° N. lat.) in Hesse-Darmstadt, north-north-east from Basel. This valley is fenced in by the Black Forest on the east and by the Vosges on the west; in it stand the cities of Mülhausen, Colmar, Strasburg (on the Ill, 2 miles from the Rhine), Germersheim, Spires, Ludwigshafen, and Worms, all on the Alsatian side, and Freiburg, Baden, Rastatt, Carlsruhe, Mannheim, Heidelberg, and Darmstadt on the opposite side of the river. Along this section the Rhine splits into many side arms that flow parallel to the main stream, and is studded with green islands. Navigation, however, which begins at Basel (although boats ply for short stretches on the upper waters above that point, even as high as Coire) is facilitated by artificial means, in that the current is made to flow in a carefully kept, straightened channel. Of the numerous affluents which add their waters to the volume of the Rhine along this section the largest are the Neckar and the Main, both coming from the right, and both navigable; the Ill, which falls into it from the left, is also navigable. A little below Mainz the Rhine (685 yards wide) is turned west by the Taunus range; but at Bingen it forces a passage through, and pursues a north-westerly direction across Rhenish Prussia, past Coblenz, Bonn, Cologne, Düsseldorf, Ruhrort, and Wesel as far as the Dutch frontier, which it reaches a little below Emmerich, and opposite Cleves; here it is 1085 yards wide and 36 feet above sea-level. The first half of this portion of the river from Bingen to Bonn is the Rhine of song and legend, the Rhine of romance, the Rhine of German patriotism. Its banks are clothed with vineyards that yield wine esteemed the world over (see below); the rugged and fantastic crags that hem in its channel are crowned by ruined castles; the treasure of the Nibelungs rests at the bottom of the river, but higher up, at Worms; the Bingerloch (see Bingen) and the Mouse Tower of Bishop Hatto, the fortress of Ehrenbreitstein, the rock of the siren Lorelei, the commanding statue of Germania (the trophy of German victory in 1870), and innumerable other features lend interest to this the middle course of 'Father Rhine,' as his German children call him. It still inspires them, as in 1870, when Max Schneckenburger's *Wacht am Rhein* (written in 1840; the music by K. Wilhelm, 1854) was sung by them with the greatest enthusiasm as they poured into France. There is the *Rheinlied*, too, of Nikolaus Becker, with Alfred de Musset's retort, *Nous l'avons eu, votre Rhin allemand*, both of them written in 1841. Between Bingen and Bonn the steep rocky walls that fence

in the river approach so closely together that in many places there is not room for the carriage-road and the railway to run alongside; they have to find a way through tunnels. Mainz (269 feet) is the head of steamboat navigation from Rotterdam. The Nahe enters the Rhine at Bingen, the Moselle at Coblenz; from the opposite (right) side the Lahn enters just above Coblenz. A few miles below this town gigantic rafts are formed out of smaller ones, floated down from the Black Forest and the woods towards Lorraine and the Palatinate, and are then steered by the numerous men who live on them right down to Dordrecht in Holland, where they are sold. Below Bonn the Rhine is joined by the Sieg, Wupper, Ruhr, and Lippe, all from the right.

At Bonn the river enters the plains, and almost immediately after passing the Netherlands frontier its delta begins. The principal arm, carrying two-thirds of the volume, flows under the name of the Waal, and later the Mermede, due west past Nimeguen until it reaches Dordrecht. East of the Biesbosch it picks up the Maas (Meuse) from the left. At Dordrecht the river again divides, one branch, the old Maas, running out to sea; the other, the Noord, going up north-west to Rotterdam, just above which town it is joined by the Lek, another main arm of the deltaic complex, and below which town it once more unites with the Old Maas. The arm that strikes off northward at the point where the delta begins soon divides, sending one branch, the Yssel, due north to the Zuider Zee, which it reaches on the east side near Kampen; the other branch is the Lek, which runs into the Waal-Maas arm above Rotterdam. A thin stream called the 'Winding Rhine' leaves the Lek half-way between Arnheim and Rotterdam; but it again splits at Utrecht into two channels, of which the Old Rhine, a mere ditch, comparatively speaking, manages with the help of a canal and locks to struggle into the North Sea at Katwyk, a little to the north-west of Leyden, while the other channel, the Vecht, flows due north from Utrecht until it enters the Zuider Zee, a short distance from Amsterdam. For considerable distances in these delta regions the rivers are only kept from overflowing the country by artificial banks or dykes.

The area drained by the Rhine is estimated to be 75,773 sq. m., and its total length to be 760 miles, of which 550 in all are navigable. By means of the Ludwigs Canal it is connected with the Danube; the Rhone and Rhine Canal unites it with the Rhone, and so with the Mediterranean; another canal provides a waterway between it and the Marne, a tributary of the Seine; and yet a fifth unites it with the Zuider Zee at Amsterdam. The fisheries of the Rhine are of considerable importance; salmon, carp, pike, sturgeon, and lampreys—the fish of greatest value—are taken principally near St Goar, between Bingen and Coblenz. The waters are partly restocked from the fish-hatcheries of Hüningen in Upper Alsatia (see PISCICULTURE).

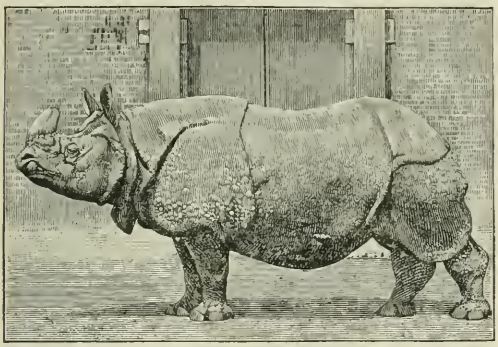
Commercially and historically the Rhine is one of the principal rivers of Europe. It was the Romans' strongest bulwark against the Teutonic invaders. The Romans, and after them the Franks, encouraged commerce to travel up and down its waters, and kept its channel open. Under Charlemagne the ravages caused by the Teutons having broken through the Roman guard along the Rhine and inundated Gaul were rapidly obliterated, and the Rhine valley became the principal focus of civilisation in the early empire. Except between 1697 and 1871 the Rhine was always a purely German river; at the peace of Ryswick, Alsace-Lorraine was appropriated by France, and the Rhine became part of the dividing line between France and Germany. In 1801 Napoleon incorporated the whole of the left bank with France; and in 1815 the arrangement in force before 1801 was restored; and after 1871 the Rhine became once more wholly German. From the days of the Roman supremacy down to the beginning of the 19th century navigation was always more or less hampered by the riparian sovereigns, during the greater part of the time a large number of duodecimo princelings, who levied vexatious dues on the shipping that sailed up and down past their towns and territories. From 1803 all the powers concerned, except Holland, abolished most of the shipping dues on their own vessels navigating the Rhine, and Holland followed suit in 1831; but it was not until 1st July 1869 that the river was declared an absolutely free waterway to the ships of all nations. The first steamboat churned up its waters in 1817; now some scores ply all the way between Rotterdam and Mainz, and others along other stretches. More than 18,000 vessels of about 2,000,000 tons burden pass the frontier town of Emmerich going up stream every year. There have been various schemes for utilising the mechanical power of the Rhine current by means of turbines and electromotors. For the political organisation (1805–13) taking its name from the Rhine, see CONFEDERATION OF THE RHINE.

RHINE-WINE indicates, strictly speaking, the wines produced in the Rheingau (q.v.), the most valued and costly being those of Castle Johannisberg, Hochheim (whence the word *Hock*, applied in England promiscuously to all white Rhine wines), Rüdesheim, Steinberg, Gräfenberg, Rauenthal, Marcobrunn, Assmannshausen, and Geisenheim. Except the wine of Assmannshansen (Assmannshäuser), which is red, these wines are of a white or light golden colour, and have an exquisite bouquet and a dry piquant flavour. In a wider sense the term Rhine-wine includes the wines of nearly all the valleys lying contiguous to the Rhine—those of Baden, Alsace, the Moselle, Hesse-Nassau, and the Palatinate.

See the illustrated *Rhine*, by K. Stieler (Eng. trans. 1878; new ed. 1887); the guidebooks of Murray and Baedeker; Simrock's *Rheinsagen* (9th ed. 1883) and *Das malerische und romantische Rheinland* (4th ed. 1865); and the history of the river from Celtic to modern times, by Mehlis (3 vols. Berlin, 1876–79).

Rhinoceros. This genus, representing a distinct family of ungulate mammals, contains only five distinct species, to which another (*R. lasiotis* Sclater) may be perhaps (at present, however, doubtfully) added. These five species are distributed in the hotter parts of the Old World as follows: Africa contains two forms, which are often called the 'Black' and the 'White' rhinoceros. These terms are, however, very inapt, since both of them are of a grayish black; in colour there is but little difference between *R. simus* and *R. bicornis*. They may, however, be distinguished by other points—the first species is much larger, and has a flat nose and square upper lip, while *R. bicornis* has the upper lip prolonged so as to enable it to seize and break off branches. Correlated with this structural difference is one of habit; *R. simus* grazes, while *R. bicornis* feeds chiefly upon shrubs. A number of other species have been stated to occur in Africa, but it appears that these 'species' have been for the most part founded upon unimportant differences in the length of the two horns with which these animals are furnished. In Asia there are at least three well-marked species of rhinoceros. The large one-horned species, *R. unicornis*, occurs only in Nepal, Bhotan, and Assam; it is a very big species. A specimen in the Zoological Society's Gardens measured over 10 feet in length and a little more than 5 feet in height at

the shoulder. It has enormous folds of skin, which give it the appearance of being 'armour-plated.' The African species have a smooth, though of course very thick, skin. The second Asiatic rhinoceros is *R. sondaicus*, which is smaller than the last, though also one-horned; it occurs in Java, Burma, and the Sundarbans near Calcutta. The two-horned Asiatic rhinoceros (*R. sumatrensis*) is found in Malacca, and *R. lasiotis*, from Chittagong, eastern Bengal, is hardly separable from it.



Rhinoceros unicornis.
(From a Photograph by Gambier Bolton, F.Z.S.)

Rhinoceroses were more abundant in earlier periods of the earth's history than they are at present; one form (*Aceratherium*) existed without the characteristic horn or horns, while another (*Diceratherium*) had the horns placed side by side instead of following each other. The animals are now a waning race, and African hunters report their diminished numbers in that continent. One of the principal authorities upon African rhinoceroses—Mr F. C. Selous—has brought forward facts which tell of the approaching extinction of these great quadrupeds in South Africa. 'Twenty years ago,' he says, 'this animal [*R. simus*] seems to have been very plentiful in the western half of South Africa; now (1881), unless it is still to be found between the Okavango and Cunene rivers, it must be almost extinct in that portion of the country. And this is not to be wondered at when one reads the accounts in Andersson's and Chapman's books of their shooting as many as eight of these animals in one night as they were drinking at a small water-hole; for it must be remembered that these isolated water-holes at the end of the dry season represented all the water to be found over an enormous extent of country, and that therefore all the rhinoceroses that in happier times were distributed over many hundreds of square miles were in times of drought dependent upon perhaps a single pool for their supply of water. In 1877, during several months' hunting in the country to the south of Linyanti, on the river Chobe, I only saw the spoor of two square-mouthed rhinoceroses, though in 1874 I had found them fairly plentiful in the same district; whilst in 1879, during eight months spent in hunting on and between the Botletlie, Mababe, Machabe, Sunta, and Upper Chobe rivers, I never even saw the spoor of one of these animals, and all the Bushmen that I met with said they were finished.' The rhinoceros has got the reputation of being a savage creature, and there are terrible stories of encounters; these, however, appear to have been greatly exaggerated, though individuals may be vicious at times. All the species of rhinoceros have been exhibited in Europe with the exception of *R. simus*.

The rhinoceros, united with the horse and tapir, forms the Perissodactyle division of the Ungulata (q.v.). The Asiatic rhinoceroses are distinguished from the African forms by the presence throughout life of functional incisor teeth. Professor Flower has shown that in other (osteological) characters the African species are to be contrasted with the Asiatic; in spite of its two horns, *R. sumatrensis* is more closely allied to *R. unicornis* than to *R. bicornis;* even the fossil species are referable for the most part to one or the other group. The Siberian *R. tichorhinus*, of which a specimen, partly preserved through its being frozen, was found by the Russian naturalist, Pallas, belongs to the African group, which is sometimes separated under the generic name of *Atelodus*.

Rhinoplastic Operations. When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. When the whole nose has to be replaced, the following course is usually adopted. A triangular piece of leather or gutta-percha is cut into the shape of the nose, and is extended on the forehead with its base uppermost; its boundaries, when thus flattened, are marked out on the skin with ink. Any remains of the old nose are then pared away, and a deep groove is cut round the margins of the nasal apertures. When the bleeding from these incisions has stopped, the marked portion of the skin of the forehead must be carefully dissected away, till it hangs by a narrow strip between the eyebrows. When the bleeding from the forehead ceases, the flap must be twisted on itself, so that the surface which was originally external may remain external in the new position, and its edges must be fastened with stitches into the grooves prepared for their reception. The nose thus made is to be supported with oiled lint, and well wrapped in flannel to keep up the temperature. When complete adhesion has taken place, the twisted strip of skin may be cut through, or a little slip may be cut out of it, so that the surface may be uniformly smooth. Either at the first operation or subsequently a new columna (the front part of the septum) is usually formed from the skin of the upper lip. When only a part of the nose, as one side only, or the septum, requires to be restored, modifications of the above operation are required, and the skin, instead of being taken from the forehead, is taken from the cheek or the upper lip. This operation is called the *Indian Method*, having been introduced from the East and first successfully performed in Europe by Carpue in 1814. It has almost entirely superseded the *Taliacotian Operation*, first performed by Tagliacozzi or Taliacotius (1546-99), professor of Anatomy and Surgery at Bologna, and described in his famous work *De Curtorum Chirurgia per Insitionem* (1597). He took the skin for the new nose from the arm of his patient; and there is no reason why the operation which he describes, although inferior in many respects to that at present adopted, should not be successful. The difficulty and irksomeness of keeping the arm sufficiently long in apposition with the face (a period of about twenty days) is the chief objection to his method. For further details, see Holme's *System of Surgery*, or Erichsen's, or any other surgical manual.

Rhizantheæ, one of the five classes into which Lindley divides the vegetable kingdom. There are three natural orders comprised in the class—viz. Balanophoraceæ, Cytinaceæ, and Rafflesiaceæ, but they have been placed widely apart in the botanical systems of other botanists. The species comprising them agree only in being destitute of true leaves, in having short amorphous stems or none, and in being parasitical on roots. The structure of the flowers, which are in some instances very large,

is extremely diverse. *Cynomorium* (q.v.), belonging to the Balanophoraceæ, is a most interesting plant, the *Fungus Melitensis* of apothecaries, long celebrated for arresting hæmorrhages. Others likewise are used as styptics. *Cytinus hypocistis* (Cytinaceæ) grows on the roots of species of Cistus in the south of Europe; its extract is used as an astringent in hæmorrhages and dysentery. A species of Ombrophytum (Balanophoraceæ) springs up suddenly after rain in Peru, like a fungus. Various species of Balanophora abound in Northern India. They are found in the Himalayas at an elevation of 10,000 feet, producing great knots on the roots of maple trees, oaks, &c.

Rhizocarps. See SALVINIA.

Rhizome. See ROOT.

Rhizo'poda (Gr. *rhizon*, 'a root,' and *poda*, 'feet'), a division of the Protozoa, in the members of which the living matter of the cell flows out in changeful processes as 'pseudopodia.' In other words, the rhizopods are Protozoa in which the Amœboid phase of cell-life predominates. The division includes several classes, of which the most important are the Lobosa, with the Amœba as type, the Heliozoa or Sun-animalcules, the Radiolaria, and the Foraminifera. See AMŒBA, FORAMINIFERA, PROTOZOA, RADIOLARIA.

Rhode Island, the smallest of the United States, and one of the original thirteen states of the Union: the state takes its name from the *island* of Rhode Island in Narragansett Bay. Its length from north to south is not quite 50 miles, and its width is about 40 miles; land area, 1085 sq. m. Rhode Island has thus a land surface only about $\frac{1}{32}\frac{1}{0}$th as great as that of Texas, the largest state; but, while it ranks only thirty-fifth among the forty-nine states and territories in order of population, in density of population (318 per sq. m.) it holds the first place. Its name is referred by some to a supposed resemblance of the island of Rhode Island to Rhodes in the Mediterranean, while by others it is considered to be a corruption of *Roodt Eylandt* ('Red Island'), a name bestowed upon this island by the early Dutch.

Copyright 1891 in U.S. by J. B. Lippincott Company.

There are no mountains in the state, but the surface is considerably diversified. The northern and eastern sections are hilly, and the land slopes toward a level region in the south. The most important elevations are Woonsocket Hill, Mount Hope, Diamond Hill, and Hopkins Hill. The coast along the Atlantic Ocean measures about 45 miles, but Narragansett Bay, which penetrates inland some 30 miles, affords with its various inlets about 350 miles of shore washed by tide-water. The southern coast west of Point Judith is low and sandy, with numerous fine beaches, and many marshes and ponds of salt water. To the west the shores are formed by high rocky cliffs interspersed with beaches of sand. Newport, Narragansett Pier, and Watch Hill, on the ocean coast, are among the most famous seaside resorts of the country; and Block Island, about 10 miles SW. of Point Judith, is also a favourite watering-place.

The western part of the state is marked geologically by the Archæan formation which is characteristic of much of New England, but an extensive coal-bearing area of the Carboniferous period stretches under the bay across the eastern part of the state into Massachusetts. It is the most eastern bed of anthracite in the United States, but thus far the coal which has been mined has been of inferior quality. There are deposits of iron ore, and excellent limestones and granite. Traces of the terminal moraine of the glacial period are visible in the state, and in many places the soil is stony or rocky, though in some localities it is moderately fertile. Agriculture, however, except in the way of market-gardening, is by no means a leading occupation.

Rhode Island enjoys a maritime climate, milder and more equable than that of other portions of New England. The rivers of the state are of little importance for navigation, but are of great value in furnishing water-power, and have played a prominent part in developing the industries of the state. The principal rivers are the Seekonk, navigable to Pawtucket, the Woonasquatucket, the Pawtuxet, and the Pawcatuck.

Newport has one of the finest harbours in the world, and the bay affords an extensive area of safe anchorage, with excellent ports at Bristol, Warren, and Providence. Formerly these places enjoyed a large foreign commerce, which finally disappeared with the war of 1812, and, though a considerable coasting trade is still carried on, commerce from that time ceased to be a prominent industry. It was replaced by manufacturing, which has ever since been the characteristic occupation of the people. The cotton manufacturing industry of the United States had its birth in Rhode Island. In 1790 Samuel Slater, who had been an apprentice in England, built at Pawtucket Falls the first cotton-mill of America. He equipped the mill throughout with a complete set of machinery which he constructed from memory, and by the time Rhode Island had ceased to be a commercial state it had already upwards of fifty cotton-mills. Cotton manufacturing, with dyeing, bleaching, and calico-printing, still holds the first place among the industries of the community, followed in importance by the manufacture of woollen and iron goods—especially screws, locomotives, and firearms—and of jewellery (see PROVIDENCE), rubber and leather goods, &c.

There are five counties in Rhode Island and four cities, Providence, Newport, Pawtucket, and Woonsocket. Of these Providence and Newport are both capitals of the state. The common school system, established in 1828, is of the highest order; but on account of the number of foreign-born persons attracted to the mill villages, and the difficulty in such communities of securing regular attendance at the schools, there is a remarkable prevalence of illiteracy. In 1897 there were 59,428 pupils enrolled at the elementary schools, with 1686 teachers; 2909 pupils and 131 teachers in high schools; and 850 students and 76 professors at Brown University (1764), one of the oldest and best colleges of the country.

The Northmen are supposed to have visited Rhode Island in the 10th century; and the 'Old Stone Mill' at Newport (q.v.) has been claimed as their work. The first permanent settlement was made at Providence by Roger Williams in 1636. He and other settlers purchased lands from the Indians, and, as a result of the wise policy displayed toward the natives, Rhode Island suffered less from trouble with the Indians than many of her sister colonies. Rhode Island was the last (1790) of the original thirteen states to ratify the constitution. In the war of the revolution, in that of 1812, and in the civil war of 1861–65, she took an active part. Pop. (1730) 17,935; (1830) 97,199; (1880) 276,531; (1890) 345,506.

Rhodes, an island of the Mediterranean belonging to Turkey, formerly an important, wealthy, and independent state of ancient Greece, lies 12 miles distant off the south-west coast of Asia Minor. It is 49 miles long and 21 broad, and is traversed in the direction of its greatest length—north-east to south-west—by a chain of mountains, which in Mount Artemira (the ancient *Atabyris*) reach a height of 4070 feet. The soil is on the

whole fertile, and produces wine, oranges, figs, olives, and other fruits. Nevertheless, much land lies waste, and the population is decreasing—34,000 in 1843; 28,000 in 1890, all Greeks except 7000 Turks and 2500 Jews. The harbours are neglected, and the trade is inconsiderable (£140,000 a year). Sponges are the most valuable article of export.

The first historic inhabitants of ancient *Rhodos* were Dorian Greeks from Argos. Situated between the three ancient continents, a position highly favourable to the development of commercial enterprise, the Rhodians at an early period became very prosperous and affluent. Their three most ancient towns were Lindus, Ialysus, and Camirus, and they planted numerous colonies not only on the neighbouring shores, but also on the coasts of Italy, Sicily, and Spain. With Cos and Cnidus these three towns formed the Doric Pentapolis, a religious league. The island submitted to the Persians in 490 B.C., but was freed from their yoke by Themistocles after the battle of Salamis; the Athenian supremacy, however, soon took the place of the Persian. Athens and Sparta supported the democratic and the oligarchical parties in the island respectively, and struggled one against the other for power over it. But in 404 B.C. Lindus, Ialysus, and Camirus founded the city of Rhodes (see below); after this event the history of the island is comprised in that of the new city. The internecine struggle between the oligarchical party (backed by Sparta) and the democratic (supported by Athens) went on until Rhodes submitted to Alexander of Macedon in 332 B.C.; but after his death the Rhodians revolted again. Then began their most prosperous period; they became the first naval power in the Ægean, their ships being well built, and always splendidly manned and manœuvred. As allies of the Romans, they opposed the Macedonians, and later the empire of Syria, especially Antiochus the Great; but on the whole they preserved a steady neutrality. Later still they won great glory by beating off Mithridates the Great, who laid siege (88 B.C.) to the city. After coquetting with Ptolemy, the Rhodians finally sided with Cæsar; but, venturing to oppose Cassius, the city was plundered by him (43 B.C.), and her ships all carried off or destroyed. This struck a fatal blow at her naval power. Under Vespasian Rhodes was made a Roman province, and continued so, subject to Byzantium after the division of the Roman empire, until it was captured by the Saracens in 653 (or 672); who kept it, however, only five or six years. When the Crusades began, Rhodes was a convenient stopping-place for the Christian fleets. In 1125 it was plundered by the Venetians; in 1204 a Rhodian chief asserted the independence of the island, but thirty years later he felt compelled to put himself under the sovereignty of Venice. In 1248 the city was surprised by the Genoese, but they were soon turned out by the Byzantines, and so Rhodes came back to the eastern emperor. In 1309, after a three years' siege, the city fell into the hands of the Knights Hospitallers (q.v.) of St John, and they made it their headquarters. The Turks besieged them there in 1480, and again in 1522–23; on both occasions there was terrible fighting, the Turkish losses being 25,000 and 90,000 to 100,000 men during the two sieges respectively. The Knights, who under their grand-master D'Aubusson (q.v.) beat off their enemies in 1480, were compelled, in spite of their valour and the skill of their grand-master, De Lisle Adam, to capitulate on honourable terms in 1523; they sailed away to Crete. The island has remained a Turkish possession ever since. The city suffered severely from earthquakes in 227 B.C. (when the Colossus was thrown down), 157 A.D., 515, 1364, 1481, 1851, 1856, and 1863.

The *city* stood at the northern extremity of the island, on the slopes of a natural amphitheatre, and was built on a regular plan, the unity and harmony of its architecture being due to the circumstance that it was the work of one man, Hippodamus of Miletus, the builder of the Piræus. It was girt about by strong walls, surmounted by towers, and was provided with two excellent harbours. At the entrance of one of its ports stood the gigantic statue of Helios, the Colossus (q.v.). Besides this statue, one of the seven wonders of the ancient world, 3000 others, of which 100 were colossal, adorned the city, even in the 1st century A.D. The city was rebuilt on the same scale of architectural splendour after each successive destruction by the earthquakes. The arts were prosecuted with assiduity, the city being remarkable for the number and excellence of its paintings, sculptures, and statues; the most important survivals are the Laocoon (q.v.) and the Farnese Bull (at Naples); and intellectual activity manifested itself here long after it had declined in most parts of Greece. Parrhasius and Protogenes are celebrated amongst the painters of Rhodes, Lysippus, Chares, Agesander, Polydorus, Athenodorus amongst her sculptors, and Cleobulus (one of the seven wise men), Timocreon (the scurrilous poet), Eudemus (the Aristotelian), Panætius (the philosopher), and others amongst her writers. Her school of rhetoric was very famous. The first meridian of ancient geographers passed through Rhodes. The island produced also many celebrated athletes. The existing city dates for the most part from the period of the Knights' occupation. The streets are narrow and winding, the houses solidly built, with flat roofs; but the famous street of the Knights, running down to the harbour, is long and comparatively wide. The principal buildings that survive are the church of St John (now a mosque, but in part destroyed by a gunpowder explosion in 1856), the Knights' hospital, and the grand-master's palace. The city walls still stand. Rhodes is the seat of a Greek archbishop. Pop. 10,000. 'Rhodian Law' was a code compiled by the ancient Rhodians while they held the sovereignty of the sea. See Torr's *Rhodes in Ancient Times* (1885) and *Rhodes in Modern Times* (1887).

Rhodes, the RT. HON. CECIL JOHN, statesman, was born 5th July 1853, the fourth son of the vicar of Bishop-Stortford in Hertfordshire, and after attending the local grammar-school was sent for his health to Natal, where his brother was a planter. He subsequently went to the Kimberley diamond diggings; there he soon became conspicuous and amassed a fortune. He came back to England and entered at Oriel College, Oxford, and though his residence was cut short by ill-health, he ultimately took his degree. He entered the Cape House of Assembly as member for Barkly. In 1884 General Gordon asked him to go with him to Khartoum as secretary; but Rhodes had just taken office in the Cape ministry. He sent £10,000 to Mr Parnell to forward the cause of Irish Home Rule. In 1890–94 he was prime-minister of Cape Colony; but even before this he had become the ruling spirit in recent extensions of British territory, as in securing the charter for the British South Africa Company (see MATABELELAND). He it was mainly who brought it about that Bechuanaland remained a British possession, instead of falling to the Boers. And 'Rhodesia' has not unnaturally superseded Zambesia (q.v.) as the name of a vast area now British, north and south of the Zambesi, which he has done much to develop. For the Jameson raid into the Transvaal, which he was believed to have prompted, see JAMESON (L. S.). Since 1898 he has strenuously promoted an African Continental telegraph

and a Cape to Cairo railway. He was in Kimberley during the siege by the Boers, and was thanked for his services in supporting and inspiriting the defence. He maintains a great menagerie (lions, &c.) on Table Mountain: and in large enclosures zebras, ostriches, and antelopes of all kinds run wild. He is D.C.L. of Oxford, and a member of the Privy Council. There is a (eulogistic) *Biography and Appreciation* by 'Imperialist' (1897) and a collection of his speeches (1890).

Rhodium (sym. Rh, at. wt. 104, sp. gr. 12·1) is one of the metals of the platinum group. It is a white, very hard metal, resembling aluminium rather than silver. It fuses less easily than platinum. It is ductile and malleable when pure and after fusion, and insoluble in all acids; but when alloyed in small quantity with platinum, copper, bismuth, and lead it dissolves with them in *aqua regia*. It usually forms about one-half per cent. of the ore of platinum, from which it is extracted by a somewhat complicated process. Three oxides, two sulphides, and a chloride of rhodium have been obtained and examined by chemists. The chloride unites with several soluble chlorides to form crystallisable double salts, which are of a rose colour (whence the name rhodium, from the Gr. *rhodon*, 'a rose'). The metal was discovered in 1803 by Wollaston.

Rhododendron (Gr., 'rose-tree'), a genus of trees and shrubs of the natural order Ericeæ, having ten stamens, a very small calyx, a bell-shaped or somewhat funnel-shaped corolla, and a capsule splitting up through the dissepiments. The buds in this and nearly allied genera, as Azalea (q.v.), are scaly and conical. The species are numerous; they have evergreen leaves, and many of them are of great beauty both in foliage and in flowers. A few small species are natives of continental Europe and of Siberia; but the greater number belong to the temperate parts of North America, and to the mountains of India. *R. maximum*, so designated when the far larger Indian species were unknown, is common in Britain as an ornamental shrub. It is a large shrub or small tree, which forms impenetrable thickets on many parts of the Alleghany Mountains, and has a magnificent appearance when in flower. The leaves are large, oblong, acute, stalked, leathery, dark green and shining above, rusty brown beneath. The flowers are large, in umbellate corymbs, varying in colour from pale carmine to lilac. This species is quite hardy in Britain; as is also *R. ponticum*, a very similar species, with narrower and more pointed leaves, which are of the same colour on both sides, a native of western Asia, and apparently also of the south of Spain. *R. Catawbiense*, a native of the southern parts of the Alleghanies, with large purple flowers; *R. Caucasicum*, the name of which indicates its origin; and *R. arboreum*, a native of Nepal, with very dense heads of large scarlet flowers, and leaves 4–6 inches long, attaining in its native country a height of 30 or 40 feet, are also fine species, and well known. Most of the extremely numerous varieties now common in our gardens and shrubberies have been produced from them by hybridising or otherwise.—Many splendid species of rhododendron were discovered in the Himalayas, the Khasia Hills, and other mountainous parts of India, by Dr Hooker and others; and many of them have been introduced into cultivation in Europe. *R. Falconeri* is described as in foliage the most superb of all, the leaves being 18 or 19 inches long. It is a tree 30–50 feet high, with leaves only at the extremities of the branches. It grows in eastern Nepal at an altitude of 10,000 feet. *R. argenteum* has flowers 4½ inches long, and equally broad, clustered, and very beautiful. *R. Maddeni*, *R. Aucklandii*, *R. Edgeworthii*, and others have white flowers. *R. Dalhousiæ* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from three to six white lemon-scented bells, 4½ inches long, at the end of each branch. *R. Nuttalii* has fragrant

Rhododendron arboreum.

white flowers, said to be larger than those of any other rhododendron. All these belong to the Himalayas. In more southern latitudes, as on the Neilgherry Hills and on the mountains of Ceylon, *R. nobile* prevails, a timber-tree 50 to 70 feet high, every branch covered with a blaze of crimson flowers. *R. Keysii* and *R. Thibaudiense*, also natives of the north of India, have flowers with nearly tubular corolla. *R. ferrugineum* and *R. hirsutum* are small species, shrubs from 1 to 3 feet in height, natives of the Alps, and among the finest ornaments of alpine scenery. They are called *Alpenrose* (Alpine Rose) by the Germans. They have small carmine-coloured flowers in umbellate clusters. The mountain-slopes glow with their blossoms in July and August. The flora of the Himalayas contains a number of similar small species. *R. anthopogon* and *R. setosum*, dwarf shrubs with strongly-scented leaves, clothe the mountains in eastern Nepal, at an elevation of 12,000 feet and upwards, with a green mantle, brilliant with flowers in summer. *R. nivale* is the most alpine of woody plants, spreading its small woody branches close to the ground at an elevation of 17,000 feet in Sikkim. *R. lapponicum*, a procumbent shrub, with small flowers, grows as far north as human settlements have reached in Europe, Asia, and America. Some of the species of this genus possess narcotic properties. An oil obtained from the buds of *R. ferrugineum* and *R. hirsutum* is used by the inhabitants of the Alps, under the name *Olio di Marmotta*, as a remedy for pains in the joints, gout, and stone. *R. chrysanthum*, a low shrub, with golden yellow flowers, a native of Siberia, is also used in gout and rheumatism. *R. cinnabarinum*, a Himalayan species, poisons goats which feed upon it, and when used for fuel causes inflammation of the face and eyes. But the flowers of *R. arboreum* are eaten in India, and Europeans make a palatable jelly of them.

Rhodope, the ancient name of a mountain-chain (7474 feet) extending along the borders of Macedonia and Thrace. The Turks call it *Dospad Yailasi*, the Bulgarians *Despoto Dugh*, both titles having reference to the numerous (Greek) monasteries that stud its sides. Of these the most famous is the vast fortress-monastery of Rilo, in the north-west of the range, standing on its southern side in the midst of magnificent pine

forests. Rilo has for generations been the focus of the national Bulgarian church and the mainstay of Bulgarian nationality. See *Fortnightly Review* (April 1891).

Rhondda Valley, in Glamorganshire, South Wales, is noted as a centre of coal-mining and for its fine scenery. The railway connecting the whole valley directly with Swansea through the tunnel of Blaengwynte was opened in 1890.

Rhone (Lat. *Rhodānus*), the only important French river which falls into the Mediterranean, takes its rise in the Swiss Alps, on the western side of Mount St Gothard, at an altitude of 5752 feet, and not far from the sources of the Rhine. Its entire length, from its source to its mouth in the Gulf of Lyons, is 504 miles, and the area of its river-basin 38,170 sq. m. It first runs in a south-westerly direction through the canton of Valais, along a narrow valley between the Bernese and the Pennine divisions of the Alps, until near Martigny it takes a sudden turn to the north and pours its waters into the Lake of Geneva (q.v.). It issues from the lake at its southern extremity, proceeding west, and then forces a passage through the Jura. The municipality of Geneva has taken advantage of the strong and steady current of the river where, passing through the city, it is divided by an island into two arms, to utilise it for industrial purposes. A system of 20 turbines with 4400 horse-power has been constructed in a building in the bed of one of the arms, at a cost of £285,000; and by this means, in 1890, 220 motors with some 1600 horse-power were at work. Formerly the river used to disappear for some distance near Fort l'Ecluse into the subterranean channel *La Perte du Rhone;* but the vault or covering of the gorge into which it plunged has now been blown away by blasting agents. At St Génis the Rhone turns back suddenly to the north-west, and then once more flows westwards through a more level country as far as Lyons, where it is joined by its largest tributary, the Saône (283 miles long), from the north. From Lyons it follows a southern direction past Vienne, Valence, Montélimart, Avignon, and Arles, where begins its delta, embraced between two main arms, the Greater and the Lesser Rhone. Its most important affluents are, on the right, the Ain, Saône, Ardèche, and Gard; on the left, the Arve, Isère, Drôme, and Durance. From Lyons southward the Rhone is easily navigable for good-sized vessels; but the up-navigation, owing to the rapidity of the current and the sudden shifting of sandbanks, is attended with considerable difficulty, and is at times almost impracticable. On account of these and other obstructions, which are greatest near the mouths of the river, communication with the Mediterranean is in great part dependent upon canals. Canals likewise connect the Rhone with the Rhine by the Saône, with the Seine, the Loire, and the Garonne.

Rhône, a department of France, part of the former Lyonnais, has an area of 1077 sq. m. and a pop. (1891) of 806,737 (741,470 in 1881). It lies almost wholly in the basin of the Rhone and the Saône, its eastern boundary being formed by these rivers. The surface is almost entirely hilly, being broken up in all directions by low spurs of the Cevennes. Corn, potatoes, wine, and fruits are the principal products. Nearly one-half the area is cultivated, one-eighth is vineyards, one-ninth under forest, and nearly one-sixth meadows. Some 13 million gallons of wine are made annually. The department is industrially one of the most important in France; all the branches are carried on at Lyons (q.v.), the capital of the department. Arrondissements, Lyons and Villefranche. See also BOUCHES-DU-RHÔNE.

Rhubarb (Low Lat. *rheubarbarum*, from Gr. *rhēon barbaron*, literally 'barbarian rheum;' *rhēon* is an adjective from *rha*, 'the plant found near the river *Rha*'—i.e. the Volga; the botanical name being simply *rheum*), a genus of plants of the natural order Polygonaceæ, closely allied to Rumex (dock and sorrel), from which it differs in having nine stamens, three shield-like stigmas, and a three-winged achenium. The species, about twenty, are large herbaceous plants, natives of the central regions of Asia, with strong, branching, almost fleshy roots; erect, thick, branching stems, sometimes 6 or 8 feet high; the stems and branches whilst in the bud covered with large membranous sheaths. The leaves are large, stalked, entire or lobed; the flowers are small, whitish or red, generally very numerous, in large loose panicles of many-flowered clusters. The roots are medicinal; but it is not definitively known what species of rhubarb yields the valued rhubarb of commerce, which comes from inland parts of China or Chinese Tartary. The bulk of it reaches Europe now direct from China, but the best, in limited quantities, is brought through Russia. It is commonly known in Britain as *Turkey Rhubarb*, because it was formerly brought by way of Asiatic Turkey.

The leaf-stalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are much used, like apples, for tarts and various kinds of preserves. A kind of wine may also be made of it. For these purposes different kinds of rhubarb are now very extensively cultivated in Britain, and in other temperate and cold countries. A number of species have been introduced into cultivation for their leaf-stalks. The cultivated kinds, *R. undulatum*, *R. rhaponticum*, and *R. hybridum*, with endless varieties produced by the art of the gardener, all have broad, heart-shaped, undivided leaves, and the leaf-stalks flattened and grooved on the upper side. The leaf-stalks are often also of a reddish colour, which in some of the finest varieties pervades their whole flesh. Rhubarb is cultivated on a most extensive scale by market-gardeners. It

Rhubarb (*Rheum officinale*).

is forced in winter and early spring by being placed in pots within houses, or by having pots inverted over it, and dung and straw heaped around; and forced rhubarb is more tender and delicate than that which grows in open air. The stalks when blanched are much less harsh in taste and require less sugar to be rendered palatable. It is largely grown also in many parts of the United States.

The well-known medicinal *R. officinale* differs considerably in appearance from the kinds preferred in kitchen-gardens; the petioles are nearly round, and the under side of the leaf is covered with small, erect hairs. The numerous varieties of commercial rhubarb may be thrown into two groups: (1) *Asiatic Rhubarbs*—Chinese, passing under the names of Russian, Muscovy or Turkey, Canton or East Indian, Batavian or Dutch trimmed, yielded probably by *R. officinale* and a variety of *R. palmatum;* Siberian, by *R. rhaponticum:* Himalayan large, by *R. emodi*, and small by *R. webbianum;* Bokharan or Bucharian, by *R. undulatum.* (2) *European Rhubarbs*—English, by *R. rhaponticum* and *R. officinale;* French, by *R. rhaponticum, compactum*, and *undulatum;* Austrian (Moravian), by *R. rhaponticum. R. palmatum* is believed to produce some of the best Russian rhubarb. Whether *R. officinale* occurs in Shan-hsi and Sze-chwan, from which provinces the true rhubarb is chiefly obtained and sent to Hankow, is not definitively known. The export of rhubarb from China (the so-called Turkey Rhubarb) has largely increased of late years. The average shipments of the four years ending with 1889 were 7500 cwt. per annum, against less than 4000 cwt. twenty years before. The Chinese rhubarb is of very variable quality, whole chests of 1½ to 3 cwt. sometimes affording but a few pounds of sound roots. The Shan-hsi rhubarb used to be the best in the market, the roots being large, smooth, and extremely fragrant. It is now, however, of inferior quality, and dried with less care, apparently in ovens, in which case it soon rots in the centre, or is attacked by insects. Sze-chwan furnishes a good and cheap rhubarb, esteemed in the London market, where it is known as 'high-dried Shanghai rhubarb.' The roots are small, rough on the exterior, deficient in flavour, and when cut give out little scent. The plant from which the Java rhubarb is derived is not known; it resembles the Chinese in smell and taste, but its activity is one-fourth less.

The rhubarb plant is distributed through an immense tract of country in the central provinces of China; probably several species yield the same drug. According to Professor Maximoweez, *R. palmatum* is probably the plant producing the drug whose reputation dates from the time of the Arabian and Greek physicians. It was introduced by Dr Mounsey from Russia to Great Britain, and cultivated at Edinburgh by Sir A. Dick prior to 1774. Garden rhubarb (*R. rhaponticum*) was in use in England in the time of Charles II. The medicinal root is now grown extensively in England, France, Germany, Austria, St Petersburg, and other parts of Europe. It is very difficult to distinguish between the true Chinese rhubarb and the root obtained in Europe by the culture of various species of Rheum. According to Cauvet, the European may be distinguished from the exotic by (1) the rectilinear disposition of its rays, from the centre to the circumference; (2) the presence upon its circumference of a brown zone, relatively large and especially very distinct; and (3) the absence of the radiated systems (stars) so numerous in the Russian rhubarb, less frequent, but always easy to recognise, in the Chinese. In the true rhubarb the rays are dispersed irregularly over the fractured surface. Some English rhubarb, probably obtained from *R. rhaponticum*, is readily distinguished from Chinese by being less marbled upon the fracture, and by the absence of the diamond-shaped meshes upon its surface. There were formerly three classifications of rhubarb—Russian, Turkish, and Chinese or East Indian, but these are now reduced to European and Chinese. Before the opening of the treaty ports in China most of the rhubarb consumed in Europe was obtained from the Chinese at Kiachta, carefully selected and brought overland through Russia, which has entirely lost this prized monopoly, the quantity now conveyed there overland from China being insignificant. Chinese rhubarb, received direct, is distinguished by the small size, dark colour, and irregular shape of the holes with which it is pierced; by the outer surface being frequently marked with whitish reticulations, which are more evident when the powder has been rubbed off; and by the transverse surface showing a number of star-like marks, but no cortical layer. The plant is hardly cultivated in China, but grows wild. The root-stocks are dug up when from six to seven years old, just before the flowering season. They are then peeled, cut in lengths measuring 4 to 5 inches, bored through the middle, placed on strings and hung up to dry. There is considerable diversity of form in the China rhubarb, arising from the various operations of paring, slicing, and trimming; but these forms are not found in the same package, the drug being usually sorted into what are commonly known as 'rounds' and 'flats.' The Indian rhubarb is frequent in parts of the Punjab Himalayas from 7000 to 14,000 feet. It is less active than the imported rhubarb, and has been often pronounced worthless; but, according to Dr Watt, this is owing to the fact that an inferior variety reaches the plains. The whole sour stems are eaten both stewed and raw, while the leaves of this and other species are dried and smoked in Tibet and in the Eastern Himalayas.

Rhubarb is not individually mentioned now in the official trade returns, but is included with 'unenumerated drugs.' Since 1870, when the imports were 343,000 lb., and the average prices ranged from 3s. 4d. to 5s. 6d. per lb., the supplies have increased and prices have fallen by one-half. The production of English grown rhubarb root now amounts to about 12,000 lb. annually, of which from three to four thousand pounds are exported.

Chemically, rhubarb consists of mucilage, oxalate of lime, an albuminoid containing nitrogen and sulphur, crystalline resins, tannin, gallic acid, sugar, chrysophane (decomposable into chrysophanic acid and glucose), rheotannic acid, and emodin.

Rhubarb may be briefly described as a cathartic, an astringent, and a tonic. As a cathartic it chiefly operates by increasing the muscular action of the intestines; and when the cathartic action is over there is generally more or less constipation. Rhubarb is one of the best aperients for general use in infancy, in consequence of the certainty of its action, and of its tonic and astringent properties, which are of much importance in the treatment of many infantile diseases attended with imperfect digestion and irritation of the intestinal canal. In adults it is serviceable in chronic diarrhœa and dysentery, when it is expedient to clean out the bowels. It is also a useful aperient in convalescence from exhausting disease, as being free from the risk of overacting; and, for the same reason, it is a useful medicine for persons who are constitutionally liable to over-purgation from trivial causes.

Rhuddlan, a decayed town of Flintshire, North Wales, on the Clwyd, 3 miles SSE. of Rhyl. Its ruined castle, dating from 1015, and dismantled after its capture by the Roundheads in 1646, was the scene of the betrayal of Richard II. by Percy (1399); at the marsh of Morfa Rhuddlan, across the river, Offa defeated Caradoc (795). With Flint, &c., Rhuddlan returns a member to parliament. Pop. 1242.

Rhus. See Sumach.

Rhyl, a watering-place of Flintshire, North Wales, at the mouth of the Clwyd, 30 miles NW. of Chester. A mere fishing-village so late as 1830, it has fine sands, a promenade pier 705 yards long, built in 1867 at a cost of £17,000, an esplanade, an aquarium and winter garden, a dozen hotels, baths, &c.; and, though the country around is flat, it commands fine views of the Snowdonian mountains. Pop. (1851) 1563; (1881) 6029; (1891) 6491.

Rhyme, or, more properly, RIME (the former spelling being merely due to a confusion with the Greek *rhythm*), is itself a native Teutonic word; A.S. *rím*, Icel. *rima*, Ger. *reim*, and O.H. Ger. *rím* (whence Fr. *rime*, Ital. *rima*); probably cognate with Gr. ἀριθμός, 'number.' In early English rime (and the same is true of Ger. *reim* and the other forms of the word in other northern tongues as well as in the Romanic) meant simply a poem, a numbered or versified piece (compare Lat. *numeri*, 'numbers' = verses, versification); but it has now come to signify what is the most prominent mark of versification in all these tongues—viz. the recurrence of similar sounds at certain intervals. As there may be various degrees and kinds of resemblance between two syllables, there are different kinds of rime. When words begin with the same consonant we have *Alliteration* (q.v.), which was the prevalent form of rime in the earlier Teutonic poetry, as in Anglo-Saxon. In Spanish and Portuguese we find employed a peculiar kind of rime called *Assonance*, consisting in the coincidence of the vowels of the corresponding syllables, without regard to the consonants; this accords well with the character of these languages, which abound in full-toned vowels, but is ineffective in English and other languages in which consonants predominate. In its more usual sense, however, rime denotes correspondence in the final syllables of words, and is chiefly used to mark the ends of the lines or verses in poetry. Complete identity in all the parts of the syllables beginning with the same consonants constitutes what the French call *rich* rime, as in *modèle, fidèle;* beauté, santé. They designate as *poor* rimes most of such rimes as English verse allows—collocations of similar syllables beginning with different consonants, as *page* and *rage*, *nuit* and *instruit*. 'This difference of taste,' says Mr F. W. H. Myers, 'seems partly to depend on the more intimate *liaison* existing in French pronunciation between the consonant and the syllable which follows it—which syllable will often consist of a vowel sound very *rapidly* pronounced, like the terminations in the accented *é*, or very *indeterminately* pronounced, like the nasal terminations in *m* and *n*. If the consonant which gives the whole character to terminations like these differs in the two rhyming lines, there seems to be hardly enough substance left in the rhyme to satisfy the ear's desire for a recurring sound. This view is illustrated by such English rhymes as *alone* and *flown*, where an additional richness seems sometimes gained from the presence of the *l* in both the rhyming syllables.' Undoubtedly one of the delights of rime is expectance, but that of uniformity in variety, rather than of monotonous and absolute uniformity. Although such rimes are not only allowed but sought after in French, in English they are deservedly considered faulty, or rather as not true rimes at all. No one thinks of making *deplore* rime with *explore*. Riming syllables in English must agree in so far, and differ in so far: *the vowel and what follows it—if anything follow it—must be the same in both; the articulation before the vowel must be different.* Thus, *mark* rimes with *lark*, *bark*, *ark*, but not with *remark*. In the case of *mark* and *ark* the absence of any initial articulation in the latter of the two makes the necessary difference. As an example of rime where nothing follows the vowel we may take be-*low*, which rimes with fore-*go*, or with *O!* but not with *lo*. To make a perfect rime it is necessary, besides, that the syllables be both accented; *free* and merri*ly* can hardly be said to rime. It is almost needless to remark that rime depends on the sound, and not on the spelling. *Plough* and *enough* do not make a rime, nor *ease* and *decease*.

Such words as *roaring*, de-*ploring*, form *double* rimes; and un-*fortunate*, im-*portunate*, *triple* rimes. In double or triple rimes the first syllable must be accented, and the others ought to be unaccented, and to be completely identical. In the sacred Latin hymns of the middle ages the rimes are all double or triple. This was a necessity of the Latin language, in which the inflectional terminations are without accent, which throws the accent in most cases on the syllable next the last—do-*lorum*, vi-*rorum;* sup-*plicia*, con-*vicia*. Although rimes occur chiefly between the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

> And then to see how ye're negleckit,
> How *huff'd*, and *cuff'd*, and disrespeckit.
>
> And ice mast-*high* came floating *by*.

When two successive lines rime they form a *couplet;* three form a *triplet*. Often the lines rime alternately or at greater intervals, forming groups of four (*quatrains*) or more. A group of lines embracing all the varieties of metre and combinations of rime that occur in the piece forms a section called a *stave*, sometimes a *stanza*, often, but improperly, a *verse*. In the days of elaborate Acrostics (q.v.), verses constructed in shapes, and other conceits, it was the fashion to interlace rimes in highly artificial systems; almost the only complex arrangements now current in English are the various forms of the sonnet, and the Spenserian stanza. Tennyson has accustomed the English ear to a quatrain in which, instead of alternate rimes, the first line rimes with the fourth, and the second with the third.

It is a mistake to suppose that rime is a mere ornament to versification. Besides being in itself a pleasing musical accord, it serves to mark the endings of the lines and other sections of the metre, and thus renders the rhythm more distinct and appreciable than the accents alone can do. So much is this the case that in French, in which the accents are but feeble, metre without rime is so undistinguishable from prose that blank verse has never obtained a footing, notwithstanding the war once waged by French scholars against rimed versification. 'The advantages of rime,' says Guest, 'have been felt so strongly that no people have ever adopted an accentual rhythm without also adopting rime.' The Greek and Latin metres of the classic period, depending upon time or quantity, and not upon accent, were able to dispense with the accessory of rime; but, as has been well observed by Trench (*Introduction to Sacred Latin Poetry*), even 'the prosodic poetry of Greece and Rome was equally obliged to mark this (the division into sections or verses), though it did it in another way. Thus, had dactyls and spondees been allowed to be promiscuously used throughout the hexameter line, no satisfying token would have reached the ear to indicate the close of the verse; and if the hearer had once missed the termination of the line it would have been almost impossible for him to recover it. But the fixed dactyl and spondee at the end of the line answer the same purpose of strongly marking the close as does the rime in the accentuated verse: and in other metres, in like manner, licenses permitted in the beginning of the line are excluded at its close, the

motives for this greater strictness being the same.' It is chiefly, perhaps, from failing to satisfy this necessary condition that modern unrimed verse is found unsatisfactory, at least for popular poetry; and it may be doubted whether it is not owing to the classical prejudices of scholars that our common English blank verse got or maintained the hold it has.

The objection that rime was 'the invention of a barbarous age, to set off wretched matter and lame metre,' rests mainly on ignorance of its real history. It cannot be considered as the exclusive invention of any particular people or age. It is something human, and universal as poetry or music—the result of the instinctive craving for well-marked recurrence and accord. The oldest poems of the Chinese, Indians, and Arabs are rimed; so are those of the Irish and Welsh. In the few fragments of the earliest Latin poetry that are extant, in which the metre was of an accentual, not quantitative kind, there is a manifest tendency to terminations of similar sound. This native tendency was overlaid for a time by the importation from Greece of the quantitative metres; yet even under the dominance of this exotic system riming verses were not altogether unknown; Ovid especially shows a liking for them: ·

Quot cœlum stellas, tot habet tua Roma puellas;

and in the decline of classicality they become more common. At last, when learning began to decay under the irruptions of the northern nations, and a knowledge of the quantity of words—a thing in a great measure arbitrary, and requiring to be learned—to be lost, the native and more natural property of accent gradually reappeared as the ruling principle of Latin rhythm, and along with it the tendency to rime. It was in this new vehicle that the early Christian poets sought to convey their new ideas and aspirations. The rimes were at first often rude, and not sustained throughout, as if lighted upon by chance. Distinct traces of the adoption of rime are to be seen as early as the hymns of Hilary (died 368), and the system attained its greatest perfection in the 12th and 13th centuries. In refutation of the common opinion that the Latin hymnologists of the middle ages borrowed the art of rime from the Teutonic nations, Dr Guest brings the conclusive fact that no poem exists written in a Teutonic dialect with final rime before Otfried's *Evangely*, which was written in Frankish about 870. Alliteration had previously been the guiding principle of Teutonic rhythms; but after a struggle, longer protracted in England than on the Continent, it was superseded by end-rimes.

See the articles ALLITERATION, BLANK VERSE, HEXAMETER, METRE, ODE, POETRY, and SONNET; also Guest's *History of English Rhythms* (ed. by Professor Skeat, 1882), where the whole subject is learnedly and elaborately treated; Trench's *Sacred Latin Poetry* (1864); F. Wolf, *Ueber die Lais, Sequenzen, und Leiche* (Heid. 1841); and Schipper's *Englische Metrik* (Bonn, 1881–89).

Rhymer. See THOMAS THE RHYMER.

Rhymney, a town of Monmouthshire, on the river Rhymney (running to the Bristol Channel near Cardiff), 2½ miles W. of Tredegar. It is the seat of ironworks. Pop. (1861) 7630; (1891) 7733.

Rhynchophora. See WEEVIL.

Rhynchops. See SKIMMER.

Rhyolite. See LIPARITE.

Rhys, JOHN, was born near Pouterwyd in Cardiganshire, June 21, 1840, served a pupil-teacher's apprenticeship, and after the course at Bangor Normal College kept a school in Anglesey down to the end of 1865, when he entered Jesus College, Oxford. He was elected to a fellowship at Merton in 1869, and next continued his studies at the Sorbonne, Heidelberg, Leipzig, and Göttingen, returning in 1871 to become inspector of schools for Flint and Denbigh. In 1877 he was appointed professor of Celtic in the University of Oxford, in 1881 was elected a fellow, and in 1895 principal, of Jesus College. His *Lectures on Welsh Philology* (1877) and *Celtic Britain* (1882) confirmed a reputation already gained by contributions to Kuhn's *Beiträge zur vergl. Sprachforschung*, the *Revue Celtique*, and the *Archæologia Cambrensis*. He gave the Hibbert Lectures on *Celtic Heathendom* in 1886, and at the close of 1889 the Rhind Lectures at Edinburgh. Professor Rhys is a contributor to the present work.

Rhythm may be defined as measured or timed movements, regulated succession. In order that a number of parts may constitute a pleasing whole, a certain relation or proportion must be felt to pervade them, and this exemplified in the arrangement of matter into visible objects, as in sculpture, architecture, and other plastic arts, produces a rhythm which is usually called *symmetry*. Rhythm applied to the movements of the body produces the *dance*. 'The rhythmical arrangement of sounds not articulated produces *music*, while from the like arrangement of articulate sounds we get the cadences of *prose*, and the measures of *verse*. Verse may be defined as a succession of articulate sounds, regulated by a rhythm so definite that we can readily foresee the results which follow from its application. Rhythm is also met with in prose; but in the latter its range is so wide that we never can anticipate its flow, while the pleasure we derive from verse is founded on this very anticipation.'

The rhythm of verse is marked in various ways. In Greek and Latin, during their classic periods, *quantity*, or the regulated succession of long and short syllables, was the distinguishing mark of verse. In the languages descended from these the rhythm depends upon *accent*. The recurrence of similar sounds, or rime, is also used, along with accent, to render certain points of the rhythm more distinct, as well as to embellish it. See METRE, RHYME.

Rhytina, a genus of Sirenia, akin to the dugong and manatee, of which only one species has been made known—the *Rhytina stelleri*, discovered by Behring and the naturalist Steller when they were wrecked on Behring Island in 1741, and described very fully by Steller. At that date they were extremely plentiful in this part of the northern Pacific, but were soon almost extirpated by the Russian hunters and traders. Nordenskiöld's inquiries led him to believe that individuals were seen till the middle of the 19th century. The species was distinguished by its large size, sluggishness, and its having horny plates in place of teeth. The skin was rough and hairless. The *Vega* expedition brought home many skeletons.

Riad. See WAHABIS.

Riazan, a town of Russia and capital of a government, stands near the right bank of the Oka, 115 miles by rail SE. of Moscow. A straggling, ill-built town of wooden houses, it sends wheat to Moscow. Pop. 30,327.

Ribalta, FRANCISCO (1550–1628), and JUAN (1597–1628), painters of the school of Valencia.

Ribble. See PRESTON.

Ribbon, Riband, or RIBBAND (a Celtic word). The principal ribbon manufacturing centre is Coventry in England, and St Etienne and Basel abroad, as also, more recently, the middle Rhine. Ribbons were also formerly made in Derby and Leek. In Coventry the ribbon industry was commenced

by Bird at the beginning of the 18th century. Coventry was at that time a city of 12,817 inhabitants. The population increased with the progress of the ribbon industry, until in 1861 it was 41,638. In 1860 there were 8886 looms; but in 1885 not one-third of this number was employed, and the number is much less now. In 1861 there were 40,600 people dependent upon the ribbon trade, in 1881 not more than a fourth. The ruin and migration of the trade to the Continent arose from two causes—first, strikes, particularly the great one of 1860; second, the French treaty of 1860, before which this branch was protected by a duty of 15 to 30 per cent. The great competition of Basel and St Étienne then soon ruined the production of Coventry, for at these old centres labour was then much cheaper, the hours of work longer, and taste and style superior, particularly at St Etienne. Crefeld, Moscow, and especially Paterson in New Jersey, are also manufacturing centres. Amongst the various kinds of ribbons woven in Coventry are the following: Taffeta, gros-grain, twill, satin, satinette, ottoman-satin, and terry, plush, brocade, faille, plaids, watered satins, birthday-ribbons, and book-markers, sarsnets, orientals, waistbands, and other plain and figured narrow fabrics. Of the names which indicate the kind of groundwork, gros-grain is a ribbed silk; plush, a velvety or pile surface; satin, a smooth polished surface, &c.; and there are mixtures of these various fabrics, generally woven in stripes, faille with satin, satin with terry, velvet with satin, plain and figured in conjunction, making an infinite variety of decorative effects both in weaving and colour.

The construction of the fabric of a ribbon is like that of broad silks—viz. the threads or warp (Fr. *chaine*) lengthwise; those at right angles, or shot across the ribbon, the shute or weft (Fr. *trame*). The warp consists of many threads, the shute which interweaves the warp of one, or at most a few only, according to the number of colours or style of fabric required. There are two kinds of looms or methods of weaving, hand-looms and power-looms, the latter having gradually but surely superseded the former, except for very artistic work. These two looms are also of two kinds, those which weave plain goods and those which weave figured or patterned work. The latter are called Jacquard looms (see WEAVING); in these every warp-thread is so isolated as to be under mechanical control, and can be raised or not independently of every other thread. These warp-threads are raised by means of the 'harness' to allow of the shute to pass between the whole or parts of the warp-threads according to the pattern or style required. The harness is composed of 'leishes,' the purpose of which is to raise at will the warp-threads, each of which requires one leish. The term 'shed' is applied to the warp when separated horizontally by the harness for the shuttle to pass between; this is called the 'opening,' that in the upper surface being termed the top shed, and the lower part the bottom shed. The shuttle contains the quill in which has been wound the 'filling,' which is a portion of the shute or weft-thread, and is propelled in the shuttle between the warp-threads by hand or by other power, generally steam-power. In front of this complicated mechanism is the 'slay' or 'reed,' which is a comb-like apparatus through which the warp-threads pass before they receive the shute into its resting-place in the fabric. The Jacquard arrangement is placed on the top of the loom, and consists of perforated cards, with the requisite machinery to work them. See SILK.

Ribbon-fish, a name given to several genera of Acanthopterous fishes having the body much compressed and band-like, the dorsal fin extending the whole length of the back, the anterior rays being long and distinct, the skeleton soft, and the skin naked and silvery. They are true deep-sea fishes, and are widely distributed, though nowhere abundant. Some authorities divide them into two groups—the Trachypteridæ, having long ventral fins, and occasionally attaining to a length of 10 feet, with a thickness of scarcely an inch; and the Regalecidæ, with the ventral fins represented by single, oar-like filaments. The best-known species is *Regalecus banksii*, the Dealfish (q.v.).

Ribbonism, the name assumed by a group of secret associations among the lower classes in Ireland throughout the half century extending from 1820 to 1870, at its greatest height from about 1835 to 1855. Its origin and organisation are alike wrapped in obscurity, but it appears in the beginning at least to have been political in its aims, and O'Connell's opinion seems most probable, that it grew out of the northern Defenders who banded themselves to oppose the Orange organisation. Earlier associations with somewhat similar aims were the Whiteboys and the Threshers, and, in particular corners of the island, the Carders, Shanavests, and Caravats.

Ribbonism, according to O'Connell, was more political in the north, in presence of the organisation of the Orange lodges; in the south it flowed rather into what he characterised as 'driftless acts of outrage.' Although everywhere condemned by the Catholic clergy, it included none but Catholics within its numbers, and it maintained its influence by a system of oaths and secret signs and passwords. Of these many were made known to the authorities by informers, but they were found to contradict completely rather than merely differ from each other. One striking feature of Ribbonism, as distinguished from most Irish patriotic associations, was the fact that its adherents belonged exclusively to the very lowest and most ignorant classes, the humbler peasantry, farm-servants, labourers, and petty shopkeepers, hardly even the smallest farmers or their sons apparently belonging to it in any part of Ireland. So far as there was any unity in its aims, it aimed at making itself a public conscience on all agrarian questions; but, as A. M. Sullivan pointed out, the Ribbonism of one period and of one district was not the Ribbonism of another. 'In Ulster it professed to be a defensive or retaliatory league against Orangeism. In Munster it was at first a combination against tithe-proctors. In Connaught it was an organisation against rack-renting and evictions. In Leinster it often was mere trade-unionism, dictating by its mandates and enforcing by its vengeance the employment or dismissal of workmen, stewards, and even domestics. This latter phase generally preceded the disappearance of the system in a particular locality, and was evidently the lowest and basest form to which it sank or rotted in decay.'

The name, which of course originated in a green badge worn by the members, does not appear to have been attached to it till about 1826; and its influence seems to have grown gradually till about 1855, from which time it began rapidly to decline before a healthier public opinion and a growing political intelligence that recognised the greater advantage of more open and legitimate agitation. Here and there traces of a demoralised Ribbonism survived, capable of an occasional outbreak into malignant crime, but its declaration as illegal by the Westmeath Act of 1871 was hardly better than a mere flogging of the bodies of the slain.

See W. Stewart Trench, *Realities of Irish Life* (1868), and A. M. Sullivan, *New Ireland* (1877).

Ribeauville (Ger. *Rappoltsweiler*), a town of Upper Alsace, pleasantly situated amid vineyards at the west foot of the Vosges, 33 miles SSW. of

Strasburg. Excellent wines are made; cotton and calico goods are manufactured, and there are numerous flour, oil, and saw mills. Pop. 5902.

Ribera, Jusepe, called Spagnoletto ('Little Spaniard'), was born at Jativa, near Valencia, on 12th January 1588, and died at Naples in 1656. He studied a few years with Francisco Ribalta at Valencia, then crossed the sea and continued his studies in Rome, Parma, and Modena. He settled in Naples, where he adopted the boldness of Caravaggio's style, and became the ablest painter among the *naturalisti*, or artists whose treatment of subjects was based on a vigorous, but generally coarse, representation of nature, in opposition to that formed on the study of conventional or academic rules. He attracted the attention of the viceroy, became court-painter, and was elected member of the Academy of St Luke at Rome in 1630. His realism is forcible and generally gloomy: he delighted to represent horrible and gruesome subjects, such as the martyrdoms of SS. Bartholomew, Januarius, and Lawrence, 'Prometheus,' &c. Salvator Rosa and Giordano were his most distinguished pupils. He executed several etchings marked by force and freedom.

Ribes (from Arab. *ribaz*), a genus of shrubs belonging to the natural order Ribesiaceæ, familiar examples of which are the Gooseberry and the Currant of gardens. The species are chiefly natives of the temperate and colder regions of the northern hemisphere; some are found at high elevations in tropical America and on the Pacific coast, from California to Chili. They are found also on the mountains of Northern India, in the colder regions of Africa and Europe, but western America is the home of the largest number of the species. They are twiggy shrubs, often, as in the Gooseberry (*R. grossularia* and *R. speciosum*), armed with spines, clothed with deciduous alternate leaves, usually palmately lobed. The flowers are axillary in racemes, rarely solitary—small but often showy in the mass, as in *R. speciosum* and *R. sanguineum*, the former a native of California, often to be met with trained to walls in British gardens; the latter, enjoying a wide range in the northern United States, is also a very popular shrub in British gardens, well known under the name Scarlet or Flowering Currant. The calyx is the most conspicuous organ of the flower. It is persistent or adheres to the fruit after it is ripe, a feature very familiar in the gooseberry. The fruit is a berry, not in all species succulent, as in the gooseberry, currant, and others, but sometimes, as in *R. sanguineum*, almost entirely pulpless when ripe.

The most important product of the genus is the fruit, which consists of sweet mucilage mixed with malic and nitric acid along with an astringent substance. The gooseberry, the Red Currant (*R. rubrum*), and the Black Currant (*R. nigrum*) are natives of Britain—that is, they find a place in the British flora, though there are authorities who doubt whether they are truly indigenous, being rather disposed to think that where they are found wild they are merely escapes from cultivation. They have, however, been cultivated in British gardens for centuries, and the fact that they attain to higher perfection as fruits in Britain than in any other country in Europe—that in France, Italy, and Spain, although the plant is well known, the fruit is always inferior owing to the greater warmth of the climate—is strongly in favour of the presumption that the plants are indigenous to Britain (see Currant, Gooseberry, Grossulariaceæ). The fruit of *R. oxyacanthoides*, *R. lacustre*, and others, natives of North America, are pleasant to eat and have similar properties to those ascribed to the gooseberry and currants.

Rib-grass. See Plantain.

Ribs are elastic arches of bone, which, with the vertebral column behind, and the sternum or breast-bone in front, constitute the osseous part of the walls of the chest. In man there are twelve ribs on each side. The first seven are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed *vertebro-sternal* or *true* ribs; while the other five are known as *false ribs*, and the last two of these, from being quite free at their anterior extremities, are termed *floating ribs*. A glance at a skeleton, or at a plate representing the articulated

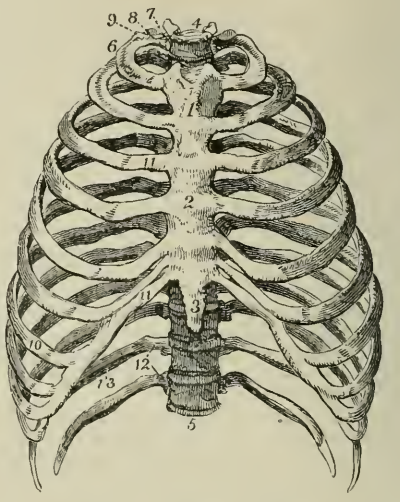

Fig. 1.—The Ribs, *in situ*:

1 and 2 are the upper and the middle parts of the sternum or breast-bone; 3, its ensiform cartilage; 4, the first dorsal, and 5 the last (or twelfth) dorsal vertebra; 6, the first rib; 7, its head; 8, its neck, resting against the transverse process of the first dorsal vertebra; 9, its tubercle; 10, the seventh or last true rib; 11, the costal cartilages of the true ribs; 12, the last two false ribs or floating ribs.

bones, will show that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior; this obliquity increasing to the ninth rib, and then slightly decreasing. They increase in length from the first to the eighth, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*. On examining a rib taken from about the middle of the series we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facet being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebræ, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercle, from whence the shaft commences. On the lower and inner part of this tubercle is a small oval surface, which articulates (as shown in fig. 2) with a corresponding surface on the upper part of the transverse process of the lower of the two vertebræ with which the head is connected. The shaft presents an external convex and an internal concave surface. A little external to the tubercle the rib is bent to form the angle, from

which point the rib passes forwards and outwards, ultimately curving inwards to join its costal cartilage. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of Mammals are mostly connected, as in man, with the bodies of two vertebræ, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea the posterior ribs hang down from the transverse processes alone. Their number on each side corresponds with that of the dorsal vertebræ. The greatest number, twenty-three, occurs in the two-toed sloth, while in the Cheiroptera eleven is the ordinary number. In Birds each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a 'diverging appendage,' which projects backwards over the next rib, so as to increase the consolidation of the

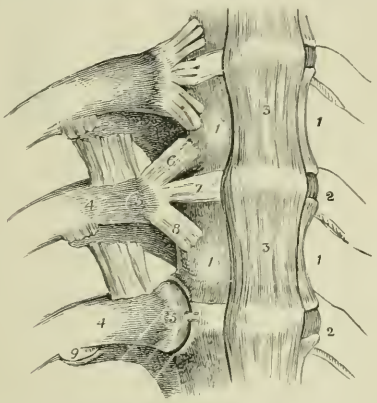

Fig. 2.—A Front View of the Articulations of the Ribs with the Spinal Column:

1, 1, dorsal vertebræ; 2, 2, intervertebral cartilages; 3, 3, anterior common ligament; 4, neck, and 5 head of rib; 6, 7, 8, flat bundles of ligamentous fibres (removed in the lowest rib, shown in the figure); 9, articulation between the tubercle of the ribs and the transverse vertebral process.

thoracic framework, necessary for flying. The dorsal vertebræ here never exceed eleven, and are commonly seven or eight in number, and the ribs proceeding from them are connected with the sternum not by cartilage, as in mammals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the Chelonian Reptiles the ribs (as well as the vertebra and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of anchylosed ribs united by dermal plates. In the Crocodiles there are only twelve pair of true or dorsal ribs; while in the other Saurians, and in the Ophidians, the ribs are usually very numerous. In the Frogs there are no true ribs, the reason probably being that any bony element in their thoracic walls would interfere with the enormous thoracico-abdominal enlargement which these animals periodically undergo at the breeding period.

In the language of the comparative anatomist, a rib is to be regarded as a *Pleurapophysis*—one of the elements of a typical Vertebra (q.v.).

Fracture of the Ribs is a very common surgical accident, resulting from blows or falls upon the chest. Ribs may, moreover, be broken by mere pressure, as when persons are severely crushed in a crowd; and instances are on record in which, in the case of aged persons, the ribs have been actually fractured in violent coughing. The treatment consists in the application of a broad flannel roller round the chest, so tightly as to prevent, as far as possible, all movement of the ribs, and to render the respiration abdominal rather than thoracic. The bandage must be prevented from falling by the addition of shoulder-straps; and in order to prevent the shoulder-blade from moving, and thus disturbing the broken ribs, some surgeons confine the arms to the side of the body. If one or both of the extremities of the fractured rib should perforate both layers of the pleura and wound the lung, or in rare cases when only the parietal layer of the pleura is injured, if the skin is also perforated, air may escape in the act of inspiration from the lung or from the exterior into the pleural cavity, and thence through the wound in the costal pleura into the cellular or areolar tissue of the trunk, giving rise to Emphysema (q.v.), in the form of a soft puffy swelling that crepitates and yields on pressure.

Ricardo. David, an eminent political economist, was born in London, 19th April 1772. His father was a Jew, a member of the Stock Exchange, and brought up his son to the same business. An alienation took place between them, when in 1793 young Ricardo married out of the Jewish persuasion and conformed to the Christian religion. He continued, however, to follow his father's profession with such success that at a very early age he realised a large fortune, while preserving an honourable reputation throughout his career in business.

In 1799 Ricardo had his interest in political economy awakened by the perusal of Smith's *Wealth of Nations*. His experience had well fitted him for the treatment of the special class of economic questions connected with banking and finance, and it was in the discussion of them that he first made his mark. In 1809 he brought out a pamphlet entitled *The High Price of Bullion a Proof of the Depreciation of Bank-notes*. As the title indicates, it was an argument in favour of a metallic basis. Other successful pamphlets followed. In 1817 appeared the work on which his reputation as an economist chiefly rests, *On the Principles of Political Economy and Taxation*. It is not a complete treatise on political economy, but may be described as a discussion of some of the principal factors of the science, such as value, wages, rent, &c. Ricardo is the conspicuous example of the abstract method of political economy. He was very deficient in the philosophic and historical training necessary for the wider investigation of economics. He approached the subject as a member of the Stock Exchange; and the economic conditions which he contemplated were those prevalent in his own day in England and in countries similarly situated, and particularly in the city of London. The main gist of his work is to embody economic principles in formulas, which for the most part have a general validity relative to the limited conditions which he thus recognised. His theories of Rent (q.v.) and of Wages (q.v.) have a general truth when regarded in this way; but when considered from a wider historical and philosophic standpoint they shrink greatly in significance. His theory of Value (q.v.) is still more defective.

In 1819 Ricardo entered parliament as member for Portarlington, and retained his seat till his death at Gatcomb Park, Gloucestershire, on 11th September 1823. He was too diffident to be an effective speaker, but his speeches, especially on matters of trade and finance, which he had made

particularly his own, always commanded respect, and had a very considerable influence. Personally he was highly esteemed. His method in political economy is now almost universally abandoned. Even the strongest supporters of the traditionary doctrines acknowledge that the value of his formulas have been greatly overrated, and must undergo continual limitation, modification, and correction in the light of experience and of historic conditions. Yet his theories are eminently worthy of study, both as a phase in the development of economic science, and as illustrating a stage in the development of economic facts. The collected works of Ricardo were edited by M'Culloch (1846), and his *Letters to Malthus* were published in 1887.

Ricasoli, Baron Bettino, Italian statesman, was born at Florence, 9th March 1809, and studied at Pisa and Florence. He was one of the best agriculturists in Italy, wrote books on the cultivation of the vine, the olive, and the mulberry, and for ten years worked successfully at the drainage of the Tuscan Maremma (q.v.). In 1859 he took a prominent part in opposing the government of the grand-duke (see Italy), and when the latter fled Ricasoli was made dictator of Tuscany. He laboured with great energy for the unity of Italy, and when that end was accomplished was by Victor Emmanuel appointed governor-general of Tuscany. On the death of Cavour (1861) he was called to the head of the ministry; but his government was undermined by Rattazzi, and he resigned in March 1862. Ricasoli returned to power in June 1866, but was again obliged to retire in April of the following year. At the same time he withdrew altogether from public life; he died in Rome, 23d October 1880. Ten volumes of his letters and papers were published in 1886–94. See Life by Gotti (1894).

Ricci, Matteo, founder of the Jesuit missions in China, was born at Macerata, 6th October 1552, studied at Rome, and in 1583 obtained leave to settle at Chow-king. He made his headquarters at Nanking, but was ultimately allowed to remove to Peking, where he built a church. He so mastered Chinese as to write dialogues and other treatises which received much commendation from the Chinese literati, and met with extraordinary success as a missionary. At his death, 11th May 1610, he was universally mourned. See Jesuits, Vol. VI. p. 314.

Riccio, or Rizzio, David. See Mary Queen of Scots.

Rice (*Oryza*), a genus of grasses, having panicles of one-flowered spikelets, with two very small pointed glumes, the florets compressed, the paleæ strongly nerved, awned or awnless, six stamens, one germen, and two feathery stigmas. The Greek name *oryza* is, according to Skeat, from an old Persian word akin to the Sanskrit *vrihi*, a word which passed into Arabic as *uruz* or *aruzz*, whence the Spanish form *arroz*. The only important species is the Common Rice (*O. sativa*), one of the most useful and extensively cultivated of all grains, supplying the principal food of nearly one-third of the human race. It seems to be originally a native of the East Indies, but is now cultivated in all quarters of the globe, and almost wherever the conditions of warmth and moisture are suitable. It is adapted to tropical and subtropical climates, rather to the latter than the former; and requires much moisture, rather, however, in the soil than in the air. Rice is an annual, varying from 1 to 6 feet in height. There are many other distinguishing characters of the varieties in cultivation, some having long awns and some being awnless, some having the chaff (*paleæ*), when ripe, yellow, white, red, black, &c. The seed or grain of rice grows on little separate stalks springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and of oats. Rice requires a moist soil, sometimes flooded; and the cultivation has in many places been attended with an increase of intermittent fevers and of general unhealthiness, the rice-fields being artificially flooded at certain seasons. In some parts of the East canals are carried along the sides of hills for the irrigation of land for the cultivation of rice. In South Carolina rice is sown in rows in the bottom of trenches, which are about 18 inches apart; the trenches are filled with water to the depth of several inches, till the seeds germinate; then the water is drawn off, and afterwards the fields are again flooded for rather more than a fortnight to kill weeds. They are flooded again when the grain is near ripening. In Europe the cultivation of rice is most extensively carried on in the plains of Lombardy and in Valencia in Spain. Marshy situations, where there is always the same abundance of water, are not so suitable for rice as those in which the supply of water is regulated according to the season and the growth of the plant. The best of all rice known in the market for size and quality is that of Carolina, yet the introduction of rice into the United States took place only about the middle or close of the 17th century; for the date has been disputed, 1694 being the earliest year in which it is known to have been grown. Rice in the husk is called *Paddy* in India.

Rice (*Oryza sativa*): *b*, a panicle in seed; *c*, a flower; *d*, a seed.

The wild rice, plentiful in the marshy tropical countries of southern Asia as well as in northern Australia, is without doubt the plant from which all our forms of cultivated rice have been derived. Most modern authorities regard India as the first home of rice, though some say it was originally derived from China. It has been cultivated in India from time immemorial. At the Calcutta Exhibition of 1884, 4000 apparently distinct forms of Bengal rice were shown, arising from differences of climate and varieties of soil. There are 1400 different specimens of rice in the Calcutta Museum. There are as many as 1300 names of rice, and though very many of these are merely local synonyms, a large number unquestionably correspond to intrinsic and seasonal distinctions. The obvious differences in the grain itself are indeed very remarkable. In colour the specimens range from a bright golden hue through almost every gradation of tint to black; and in regard to size also they vary greatly. But all these forms of rice are referable to a very few well-marked and constant varieties of *O. sativa*, the result of seminal variation commonly observed in plants that have been long brought under cultivation. The rice exported from India is divided broadly into three qualities—(1) table rice; (2) ballam, named after the boats in which it is carried; and (3) moonghy, common or inferior rice. Cargo rice is that in which only one part in five is husked. In British India there are more than 60 million acres under rice; in Ceylon,

605,000 acres; and in Cochin-China, 2 million acres. It is also extensively grown in Siam, China, Japan, Java, Egypt, and Brazil. In 1890 India exported 34,500,000 cwt.; China, 9,500,000 cwt.; Japan, 4,000,000 cwt. The produce in the United States has fluctuated much. In 1860 it was 187,140,173 lb.; in 1870, 73,635,071; in 1880, 110,131,173. In 1890, 388,912 lb. were exported, and 113,308,571 lb. were imported. After South Carolina the principal rice-growing states are Georgia and Louisiana. Great Britain imports about 6,000,000 tons annually, mainly from Burma; of this half is re-exported.

In China rice is generally sown pretty thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants *tiller* or spread at the root very much, so that each sends up several or many stalks. The rice-grounds are carefully kept clear of weeds, although often so wet that a man cannot walk in them without sinking to the knees. In many parts of China and in other warm countries it is common to obtain two crops of rice in a year.

Rice is husked and quickly dried before being brought to market. Special milling machinery is required for removing the inner skin of the rice grain, and a large quantity of the grain is badly broken in the process, being saleable only as broken rice or rice flour. Good Indian rice has the following composition: Moisture, 13·50 per cent.; nitrogenous matter, 7·41; starch, 78·10; fatty or oily matter, 0·40; ash, 0·59. Rice contains a smaller amount of nitrogenous elements than any other grain (wheat having as much as 22 per cent.); it is also deficient in fatty matter, and if taken by itself is less nutritious than other grain-food (see FOOD, Vol. IV. p. 719); but combined with fatty nitrogenous substances it is a valuable food-stuff. It is believed to furnish more food for man than any other grain, especially in Chinese regions; but it is not, as is commonly supposed, the chief food-supply of India, where, save in certain favoured areas, millet is the principal food-stuff. Ground rice is in great demand for puddings; and preparations of rice flour under such names as rizine, &c., are familiar. Owing to the small quantity of gluten which it contains, it is capable by itself only of an imperfect fermentation, and is unfit for being baked into bread. It is, however, subjected to fermentation, by help of added ferments of various kinds, in many countries. The beer made from rice by the Japanese is called *Saki*, and is in general use among them. Several kinds of *Rice wine* are made by the Chinese and Japanese, some of them highly esteemed and very intoxicating; spirit is distilled from the lees. Some of the common Arrack (q.v.) of the East is made from rice; and rice is also largely employed by distillers in Britain.

Rice Starch is made in considerable quantity in Britain, and is used in laundries and muslin manufactories. It has one-fourth more starch in its composition than wheat, hence the preference given to it by starch makers, both from its cheapness and larger yield. The straw of rice is used to make straw-plait for bonnets and the straw shoes of Japan. The refuse of rice, which remains when it is cleaned for the market, and consists of the husk, broken grains, and dust, is valuable as food for cattle. It is known as *Rice-meal* and *Rice-dust*.

Canada Rice (*Zizania aquatica*), the Wild Rice or Indian Rice of North America, is a species of grass quite different from the true rice, and of a different genus. It is common in North America, and particularly abundant in the north-western parts, growing in miry places or shallow water, often on the margins of lakes. It has a culm 7 to 8 feet high, with broad diffuse leaves, and a large terminal panicle of male flowers, with a spike of female flowers at the summit. The flowers have six stamens. The seeds are about half an inch long, slender, farinaceous, affording very good meal, and are much used by the Indians where the plant abounds.

Rice, JAMES, novelist, for nine years *collaborateur* with Mr Walter Besant (q.v.), was born at Northampton in 1843, studied at Cambridge, drifted from law into literature, and became proprietor and editor of *Once a Week*. He died in London, 25th April 1882.

Rice-bird, a name given to the Bob-o-link (q.v.), as also to a popular cage-bird, the so-called Java Sparrow (*Padda oryzivora*), really a kind of finch.

Rice-paper, a paper made in China with layers of *Fatsia* (*Aralia*) *papyrifera*, a tree peculiar to the island of Formosa. The pith is sometimes 1 to 1½ inch in diameter. By carefully cutting this pith spirally with a very sharp knife it is opened out into a sheet of snowy whiteness. When the curl has been removed by weighting, or by flattening in a press, it is ready for use. The largest sheets cut are 10 by 15 inches. It is chiefly used for making coloured drawings on. When dyed it can be made into the most perfect artificial flowers, more natural than can be produced from any other paper or fabric.

Rich, EDMUND. See EDMUND (ST).

Richard I., king of England, surnamed CŒUR DE LION, was the third son of King Henry II. and his wife Eleanor of Aquitaine. He was born on 8th September 1157, either at Oxford or at Woodstock, but was brought up amongst the knights and troubadours of Poitou, in Aquitaine, with which duchy, his mother's patrimony, he was whilst still a child invested by his father. In England Richard did not spend in all his life a full twelvemonth; after he became king he spent only twenty-six weeks in his kingdom, seventeen weeks when he landed to take the crown and to go through the coronation ceremony at Westminster, and nine weeks when he came back from his imprisonment. It may indeed reasonably be doubted whether he could speak English. A favourite of his unprincipled mother, he was induced by her to join his brothers Henry and Geoffrey in their rebellion (1173) against their father (see HENRY II.). Henry II. had his eldest son, Prince Henry, crowned king as his successor during his own lifetime; and in 1183 he ordered that his younger brothers should do homage to him. Richard obeyed with the greatest reluctance; thereupon the ungrateful Prince Henry at once picked a quarrel with him, and marched an army into his duchy of Aquitaine. King Henry hastened to the assistance of the young duke, whilst the other brother Geoffrey sided with the prince. But the sudden sickness and death of the ingrate put an end to the quarrel. In the spring of 1189 Richard was in his turn in arms against his father. Philip of France, the pertinacious foeman of King Henry, mingled in the strife; and eventually Richard joined forces with his father's enemy, did homage to him, and took the field against the old king. A reconciliation was rendered more difficult because of Richard's jealousy of John, his father's favourite.

Richard became king of England, Duke of Normandy, and Count of Anjou on 5th July 1189, and was crowned king of England on 3d September following. But he had already taken the vows of the crusader; and, besides his coronation, he had another object in coming to England: he wanted to raise funds for his crusade. He effected this

latter purpose in a brief space of time by selling whatever he could get a purchaser for. About midsummer 1190 he met Philip of France at the rendezvous, Vezelai in France; but from Lyons he made his way by a different route from Philip to Messina in Sicily. Both kings spent the winter at that city, and their mutual jealousy came within a hair's-breadth of a rupture. The throne of Sicily had just been seized by the Norman Tancred, an illegitimate son of King Roger, though the lawful heir was Henry of Hohenstaufen, son of Frederick Barbarossa, and afterwards the Emperor Henry VI. Moreover, Tancred detained in custody Johanna, widow of the late king (William the Good) and sister of Richard I., together with her very large dowry. But he made his peace with Richard by giving up to him his sister and her possessions, and by betrothing his little daughter to the boy Arthur (son of Richard's dead brother Geoffrey), whom Richard now declared to be his heir. On his way to Palestine in the spring of 1191, part of the fleet of the English king was driven on to the island of Cyprus, and the crews were most inhospitably treated by the reigning sovereign, Isaac Comnenus, a nephew of the emperor of Byzantium, who had revolted from his liege lord. Richard sailed back from Rhodes, routed Isaac in battle, deposed him, and gave his crown to Guy of Lusignan. In Cyprus, too, he married Berengaria of Navarre, whom his mother had brought to him at Messina. At last, on 8th June, the English king landed near Acre, and shortly afterwards that stronghold surrendered, the siege having lasted two years. Richard took his full share of the jealousies, animosities, and disagreements, though not of the treacheries, that made the Christian crusading host a hotbed of commotion. The glorious exploits of Richard the Lion-hearted—his march to Joppa along the seashore, his approach upon Jerusalem at Christmas, his capture of the fortresses in the south of Palestine, his second advance in the summer of 1192 on Jerusalem (the city he never beheld), and his relief of Joppa—made his name ring throughout the East and excited the wonder and admiration of Christendom, but brought no real advantage to the crusading cause. Richard in September concluded a peace with Saladin for three years, three months, and three days, and in his impulsive, impatient way started off home alone, without waiting for his army and fleet. A storm shipwrecked him near the north end of the Adriatic. In disguise he began to make his way through the dominions of his bitter enemy, the Archduke of Austria. He was recognised, seized, and handed over to the Emperor Henry VI. (March 1193). The emperor demanded a heavy ransom for his release, but promised to give him the kingdom of Arles in addition to his liberty. Richard's loyal subjects raised the money; and greatly to the chagrin of Philip of France and Richard's brother John, the captive king returned home (13th March 1194). In England in the meantime Longchamp (q.v.) had made himself so unpopular that Richard had been obliged to supersede him, appointing in his place Walter of Coutances, Archbishop of Rouen. It was John, however, who exercised the greatest power in the realm. And although he used his utmost endeavours to prevent Richard's return from his captivity, yet Richard generously forgave him. After distributing judicious rewards and punishments, raising what money he could, making arrangements for the governance of the kingdom, and being crowned again—the emperor is said to have forced his captive to resign his crown and take it back as a fief of the empire—Richard proceeded to France, and spent the rest of his life there, warring against Philip. England was governed in his absence by Hubert Walter, Archbishop of Canterbury, who by the measures he took to raise the vast sums demanded by his master trained the English people in habits of self-government. The most important constitutional advances made under Hubert's rule were the formulation of the methods for electing the county grand juries and an arrangement for keeping the pleas of the crown by officers who may be regarded as the forerunners of the modern coroner. Richard was shot, on 7th April 1199, by an archer of the Viscount of Limoges, whilst besieging that nobleman's castle of Chalus-Chabrol, and was buried in the abbey church of Fontevraud.

Richard cannot be called a good king; his only thought of his subjects was how to get money from them. He was not a faithful husband; he was an undutiful son. Yet, on the other hand, he treated his perfidious brother John in the most forgiving spirit, and was not incapable of noble and generous acts. His impulsive, hot-headed temperament made him at times cruel, but never vindictive. He was an adventurer, with a passionate love for contention and strife; he fought for warlike glory, not for victory or real advantage; he had all the personal courage and self-confidence of the born warrior; and a very large share of that careless indifference or magnanimity that is frequently associated with a bold and self-reliant character. In matters of dress and ceremony he loved magnificence, and was both ostentatious and extravagant. In person he was tall and ruddy, very skilful in the use of his weapons, and possessed of great personal strength. A fair scholar, he also had the knack of writing verses, and has been called a poet.

See BLONDEL; Stubbs' *Constitutional History* (vol. i.) and *The Early Plantagenets* (1876). Richard is the hero of Scott's *Talisman*, and figures also largely in *Ivanhoe*.

Richard II., king of England, the son of the Black Prince and Joanna of Kent, was born at Bordeaux on 6th January 1367, was acknowledged by parliament heir to the crown on the death of his father in 1376, and succeeded his grandfather, Edward III., on 21st June 1377. The government was entrusted to a council of twelve, from which the king's uncles, John of Gaunt, Duke of Lancaster, Edmund, Earl of Cambridge, and Thomas, Earl of Buckingham (afterwards Duke of Gloucester), were excluded. Nevertheless the central figure during the early years of this reign, as he had been during the last years of the preceding reign, was John of Gaunt, whose overreaching ambition and inability were a fruitful source of disquietude. He was on bad terms with the clergy and with the Londoners, and was viewed with great suspicion by the king and the commons; yet he was the most powerful man in the kingdom, having at his back the nobles and to some extent the Lollards. War was going on with France, but in a very weak and desultory fashion; the French ravaged the south coast at the time of Edward III.'s death, and truces were constantly being made for short durations. But this war cost money; so too did the extravagance of the court; and more was absorbed or wasted by the government, for which John of Gaunt was held by the nation at large to be mainly responsible. Consequently taxation was heavy. The imposition of a graduated poll-tax in 1380 provoked popular risings, directed principally against the gentry and landholders, in nearly all parts of the kingdom, at Whitsuntide in the following year. The insurgents destroyed the parks, attacked the manor houses, burned the court-rolls, and massacred the lawyers who had charge of them. The men of Essex and Kent, to the number of 100,000, marched upon London. The former body, whom the king met at Mile End on 14th June, consented to return home

when the young monarch assured them he would grant their requests, and take measures to liberate the villeins from bondage and to commute their personal services into fixed money rents. The men of Kent, after destroying the Savoy (the Duke of Lancaster's palace), burning Temple Bar, opening the prisons, and breaking into the Tower and slaying the Archbishop of Canterbury, met the king at Smithfield (15th). During the negotiations, William Walworth, the mayor of London, struck down Wat Tyler (q.v.), the leader of the insurgents. The king immediately rode amongst them, exclaiming he would be their leader, and granted them the concessions they asked. The risings in the other counties speedily collapsed when the people learned what the king had done; but during the autumn severe punishment overtook them. Seven thousand in all are said to have perished in the fighting and on the scaffold. The causes of this wide-spread and simultaneous uprising on the part of the mass of the rural population may be summarised as follows: there had been long continuance of heavy taxation; the villeins resented the reimposition since the Black Death of personal services, and were anxious to become tenants of their little farms at a fixed rental; the free tillers of the soil had formed themselves into associations to defeat the Statute of Labourers (1349), which fixed the maximum and minimum of wages; the Lollard or Wyclifite preachers were denouncing the idleness and vices of the regular clergy, and they and others (as John Ball) were promulgating social doctrines calculated to make the common people discontented with their lot and hostile to the landholders; the country clergy complained of the tyranny of the church; the mismanagement of the war, and the incapacity and selfishness of the court party provoked much discontent; there were many discharged soldiers in the country; and moral and religious feeling were sunk to a low ebb. From the fact that the insurgents directed their enmity against himself and the advisers of the king, John of Gaunt saw that he could never hope to succeed in his ambitious schemes in England; and from this time he kept very much in the background, until in 1386 he carried himself and his restless plottings to Spain and Gascony. Richard in 1390 made him Duke of Aquitaine for life. In 1385 Richard invaded Scotland, and took Edinburgh and burned it; but, not encountering the Scots, returned home. About the same year another coalition of the baronial party, headed by Thomas of Woodstock, Duke of Gloucester, began to oppose the king and his chosen friends. They impeached several of them before the Merciless Parliament (1388), and secured convictions and executions. But on 3d May 1389 Richard suddenly declared himself of age, and proceeded to govern on his own responsibility. For eight years he ruled as a moderate constitutional monarch, and the country enjoyed peace—hostilities with France were not renewed after 1388—and was fairly prosperous. But in 1394 Richard's first wife, Anne of Bohemia, whom he had wedded in 1382, died, and two years later he married Isabella, daughter of Charles VI. of France, a girl of eight. From that time he seems to have adopted very largely French tastes, manners, and ideas. At all events, in the parliament of 1397 he began to assert the pretensions of an absolute monarch. On 8th July he had Gloucester, Arundel, and Warwick arrested on the charge of conspiring against the crown. Arundel was beheaded; Gloucester was sent a prisoner to Calais, and died there in prison, probably murdered, a fortnight after his arrest; and Warwick was banished to the Isle of Man. Thomas Arundel, Archbishop of Canterbury, was also banished. In the following year an obsequious parliament granted to the king the subsidy on wool for life, and delegated all its authority and power to a commission of eighteen members, all supporters of the king. Richard soon aroused the slumbering discontent of his subjects by his unjust methods of raising money, principally by means of forced loans, and by his arbitrary and despotic rule. In the beginning of 1398 the Duke of Norfolk and the Duke of Hereford (Henry, son of John of Gaunt) were accused to the king of having spoken treason against him. Richard banished them—Norfolk for life and Hereford for ten years. In January 1399 John of Gaunt died, and Hereford succeeded him as Duke of Lancaster; but the king refused to give up to the exile the lands of his dead father. Richard in May went over to Ireland, which he had previously visited at the head of a military expedition in 1394–95. Henry of Lancaster seized upon the opportunity afforded by the king's absence, and landed on 4th July (see HENRY IV.). Richard at once hurried back, but had neither heart nor power to withstand his cousin. He submitted to Lancaster at Flint (19th August), was carried to London, and placed in the Tower. On 29th September he resigned the crown, and on the following day was likewise deposed by the parliament, which chose Henry of Lancaster as his successor. A month after his resignation Richard was condemned to perpetual imprisonment by parliament. His fate is wrapped in obscurity, beyond the almost certain fact that he met a violent death, for which it is not altogether clear that Henry IV. was responsible. A month after Henry's accession some noblemen of Richard's party formed a conspiracy to restore Richard to the throne, but their purpose was discovered. No doubt this decided the fate of Richard; at all events, authentic history knows nothing more about him from this time. According to different accounts, either he was murdered in Pontefract Castle, or he starved himself to death, or he escaped to Scotland and died there a lunatic. By nature he seems to have been passionate, impulsive, and excitable: but though capable of bold and energetic action on occasion, his habitual mood was one of indolence. He had a good insight into men's characters: but suffered himself to be influenced by those about him, and generally lacked the will and the steadfast resoluteness to act up to his own better judgment.

See *The Houses of Lancaster and York*, by J. Gairdner (1874), in 'Epochs of Modern History;' Stubbs' *Constitutional History* (vols. ii. and iii.); and read Shakespeare's historical drama *Richard II.*

Richard III., king of England, was the son of Richard, Duke of York, a descendant of Edmund, Duke of York, fifth son of Edward III., and was born, the eleventh out of twelve children, in Fotheringhay Castle on 2d October 1452. After the defeat and death of his father in 1460 he was sent, along with his brother George, to Utrecht for safety, but returned to England after his eldest brother Edward won the crown (1461). Two years later he was created Duke of Gloucester, his brother George being made Duke of Clarence. In the final struggle between the York and Lancaster factions he took an active share: he led the van at the battle of Barnet, rendered valuable aid in winning the fight of Tewkesbury, and is believed, on fairly good evidence, to have had a hand in the murder of Prince Edward, son of Henry VI., who was slain after that battle. All through the reign of Edward IV. he gave valuable and faithful support to his brother, and was rewarded by him with every confidence, and with numerous high offices. He was believed to have been concerned in the murder of Henry VI. in the Tower on 21st May 1471; but the evidence, although strongly pointing in that direction, is not conclusive. In the following year

he married Anne, the younger daughter of Warwick the King-maker, who had been betrothed to the murdered Prince Edward. This alliance was greatly resented by Clarence, who had married the elder sister, and wished to keep all of Warwick's vast possessions in his own hands. Clarence quarrelled too with King Edward, who in 1478 procured his impeachment by parliament. The refractory duke was put to death privately in the Tower on 18th February. Of this judicial murder Gloucester is likewise accused; but the evidence for his complicity is very slight. In 1482 he was put in command of the army that invaded Scotland. Along with the Duke of Albany he entered Edinburgh; but his one warlike achievement was the capture of Berwick town and castle. In the following year, whilst still in Yorkshire, he heard of King Edward's death (9th April), and learned that he himself had been named guardian and protector of his son and heir, Edward V., then aged thirteen. On his way south the Protector arrested Earl Rivers and Lord Richard Grey, the uncle and step-brother of the young king, and confined them in his northern castles. All who were of the old nobility, and resented the rise of the Woodvilles, rallied round Richard. Whether this accession of strength first suggested to him the idea of making himself king, or whether he had conceived it before, cannot of course be known; but certain it is that from this time Richard of Gloucester schemed for the crown, and by craft, boldness, and utter unscrupulousness carried his project into execution.

The arrest of Rivers and Grey had put the king entirely into his hands, for the queen-mother had hastened to take sanctuary at Westminster. On 13th June Gloucester suddenly accused Lord Hastings, an influential member of the council, of treason, arrested him there and then, and had him instantly beheaded. The 'crime' for which Hastings died was changing sides from Richard to the Woodville party. On 16th June the queen-dowager was induced to give up, at the demand of Richard and the council, her other son, the little Duke of York. He was put into the Tower to keep his brother, the king, company. On the Sunday following (22d) a certain Dr Shaw preached at St Paul's cross that the children of Edward IV. were illegitimate, nay, that Edward IV. himself and his brother Clarence were both born out of lawful wedlock. Three days later the parliament desired Richard to assume the crown; on the next day (26th June 1483) he declared himself king, and on 6th July was crowned in state by Cardinal Bourchier. Rivers and Grey were executed at Pontefract on 25th June. In point of *form* Richard was a duly elected king, and Edward V. had not yet been crowned; all the same, his accession was *de facto* a usurpation. Richard's principal supporter all through, from the date of Edward IV.'s death, had been the Duke of Buckingham, a descendant of the Duke of Gloucester who was privily slain at Calais when Richard II. was king. Shortly after his coronation Richard set out on a tour through the kingdom, and during the course of it he was surprised by the intelligence that Buckingham was plotting with the friends of Henry Tudor, Earl of Richmond (afterwards Henry VII.), the chief representative of the House of Lancaster, to effect his overthrow and proclaim Henry king. But the attempted rising soon collapsed, and Buckingham was taken, and on 2d November executed. It seems to have been shortly before this that Richard contrived the foul crime that has branded his name with infamy, and that caused himself inextinguishable remorse to the day of his death—the murder of his nephews in the Tower. The deed was done so secretly, by Sir James Tyrrell, one of Richard's devoted followers, and a couple of hirelings, that the nation did not know of it until some time after (see EDWARD V.). Indeed, the very fact of their murder has been seriously called in question, though not until much later times. But from the days of Richard himself he was popularly believed to have effected his nephews' destruction, and evidence supports the popular opinion. During the remainder of his short reign Richard directed all his energies to baffling the plans of Richmond, and to making preparations to meet the invasion which he saw to be imminent. But he was rapidly losing his hold upon the nation, alarming and horrifying it by his crimes and tyrannous acts. Henry of Richmond at length landed at Milford Haven on 7th August 1485. Richard met him at Bosworth in Leicestershire on the 22d, and there lost his kingdom and his life, fighting bravely like a king, crown on head, in the midst of his foes (see HENRY VII.). The body of the slain king was subjected to great indignities, carried to Leicester, and there, after being exposed for two days, was buried in the Grey Friars churchyard.

Richard's was a strangely mixed character. Its ruling passion was an inordinate craving for power, to gratify which he stopped at no crime, however heinous. He possessed many of the typical qualities of the best of the Plantagenets—a skilful soldier, of great ability and energy, brave, bold, reckless of consequences, fond of display, yet not incapable of nobler impulses. Had he been born the lawful heir to the throne, and succeeded to it peacefully, he would probably have been a great king; for he was a very capable ruler, aiming at the real welfare of his subjects, promoting justice, and furthering religion and morality. Yet circumstances, conflicting with his insatiable ambition, helped the evil tendencies of his nature to get the upper hand; and these grew and hardened as time went on, till his audacity and unscrupulousness were matched with a cunning and hypocrisy such as are seldom found united in one man. On the other hand, he unquestionably had great charm of manner, and knew how to inspire confidence even in those who had the best reasons for distrusting him. He was liberal too, and, where his own personal ambition was not directly concerned, just and generous. He was also swayed by a lively sense of divine justice; and more than one religious institution owed its foundation to his bitter remorse for the murder of his nephews. Most of his subjects and contemporaries looked upon him as a monster of wickedness; others, however, cherished his memory as that of a wise and good ruler. The real man was probably not quite so black as the Lancastrian (Tudor) chroniclers have painted him, though their portrait is probably fairly accurate in its broad features. In person Richard was short of stature and slight of build, with one shoulder slightly higher than the other; but there is no evidence that he was a hunchback. His face was thin and intelligent, and in portraits wears a look of sadness.

The best biography is James Gairdner's *Life and Reign of Richard III.* (3d ed. 1898). Attempts to defend his memory from some of the foul crimes laid to his charge have been made by Horace Walpole, *Historic Doubts on the Life and Reign of Richard III.* (1768); J. H. Jesse, *Memoirs of King Richard III.* (1862); A. O. Legge, *The Unpopular King* (2 vols. 1885); and C. R. Markham, in *English Historical Review* (1891). None of them can be said to have been successful in making Richard out a good man or a good king. Sir T. More's *History of King Richard III.* (1513), though highly coloured and antagonistic, is full of interest and vivid pictures of the king. *The Paston Letters*, ed. by J. Gairdner (1872–75), convey a good impression of the life and manners of the period. Shakespeare's drama gives the popular idea of Richard.

Richard of Bury. See AUNGERVILLE.

Richard of Cirencester, an early English chronicler, whose life falls between 1335 and 1401. His name is found in 1355 in the list of monks of the Benedictine monastery of St Peter, Westminster. In 1391 he obtained a license from his abbot to visit Rome, and he died in 1401. The only known work of his extant is a poor compilation in four books, the *Speculum Historiale de Gestis Regum Angliæ 447–1066*, edited for the Rolls series by Professor J. E. B. Mayor (2 vols. 1863–69). It is of some independent value for the history of Westminster Abbey and Edward the Confessor. But Richard's name is best known in connection with the notorious forgery, *De Situ Britanniæ*, long accepted, to the serious detriment of history, as an authoritative work on the antiquities of Roman Britain. This work was first printed in 1758 by its ingenious author, Charles Julius Bertram (1723–65), teacher of English in the naval cadets' school at Copenhagen, who professed to have discovered it in the Royal Library there. In the same volume were included the works of Gildas and Nennius, the title of the whole being *Britannicarum Gentium Historiæ Antiquæ Scriptores tres, Ricardus Corinensis, Gildas Badonicus, Nennius Banchorensis.* A new edition of the treatise, with an English translation, appeared at London in 1849; a reprint forms one of the 'Six Old English Chronicles' in Bohn's 'Antiquarian Library' (1848). Dr William Stukeley, with whom Bertram had corresponded since 1747, received the book warmly on its appearance; Gibbon commends 'a genuine knowledge of antiquity very extraordinary for a monk of the 14th century;' all the historians, even Lingard and Lappenberg, trusted it; and even so late as 1886 we find it gravely treated as an authority in a work by James Grant on the *Tartans of the Clans of Scotland.* Some later scholars, such as Guest, had doubted, if not condemned it, but its authenticity received its death-blow in the series of papers contributed to the *Gentleman's Magazine* (1866–67) by Mr Woodward, librarian of Windsor Castle. Again in Professor Mayor's preface the various sources of the forgery are elaborately set forth, and everything satisfactorily accounted for but the credulity of its dupes.

Richard of Cornwall, second son of John, king of England, was born on 5th January 1209. In 1225–26 he and his uncle, William of Salisbury, commanded an expedition which recovered Gascony, and the next year he received Cornwall, as the result of a rising of the earls to compel the king (Henry III.) to make provision for him. He managed his money matters well, and his wealth, as well as his prudence, saved Henry in many an impending crisis. For some years he acted with the English barons, to many of whom he was closely related by his marriage with Isabel, Countess of Gloucester, daughter of the Earl of Pembroke. In 1232 he was one of the leaders in the opposition to Hubert de Burgh; and in 1238 he headed an armed rising provoked by the king's secret marriage of his sister to Simon de Montfort. But Richard was still heir to the throne, and the articles which Henry was prepared to sign, and which dismissed his foreign advisers, appeared to the earl to bind the king's hands too closely, and he drew back. In 1240–41 Richard was away on a crusade, and the next year he was with his brother in Gascony; and in 1244 he married Sanchia of Provence, sister of Queen Eleanor, and this second marriage drew him away from the baronage. In 1252 he refused the pope's offer to sell him the crown of Sicily; but in 1257 he was elected by a majority titular king of the Romans, and was soon afterwards crowned at Aix-la-Chapelle; and he was skilful enough to maintain a certain hold on Germany, lavishing his wealth to maintain his own position and the dignity of the empire. In the great struggle which took place between Henry III. and his nobles Richard at first acted as a peacemaker. Subsequently, however, he sided with his brother against Simon de Montfort; and he was taken prisoner at Lewes, and imprisoned for a year, until the battle of Evesham (1265) set him free. In 1267 he was a third time married, to Beatrice, niece of the Elector of Cologne. Richard died at Kirkham, 2d April 1272, broken-hearted at the loss of his eldest son, Henry, who was murdered at Viterbo by the Montforts, and immortalised by Dante. Two other sons died also without issue.

Richards, BRINLEY, pianist and composer, was born at Carmarthen in Wales in 1819, the son of a church organist. He began to study music at the Royal Academy in London about 1835, and on the completion of his studies soon won a good position in London as a pianist and teacher of music. He was for many years a professor of the Royal Academy. His compositions for sacred and part songs and for the pianoforte won great popularity, especially his 'God Bless the Prince of Wales.' Richards bestowed much attention upon the study and encouragement of Welsh music. He died on 1st May 1885.

Richardson, SIR BENJAMIN WARD, M.D., LL.D., F.R.S., physician, author, and inventor, was born at Somerby, Leicestershire, 31st October 1828. He studied at Anderson's College, Glasgow, took the diploma in 1850 of the faculty of Physicians and Surgeons, and graduated in medicine at St Andrews in 1854. He was a frequent contributor to the *Medical Times and Gazette*, and gained the Fothergillian gold medal for an essay on 'Diseases of the Fœtus in Utero,' and the Astley-Cooper prize of 300 guineas in 1856 for an essay on the 'Coagulation of the Blood.' Dr Richardson's medical inventions include a double-valve inhaler for chloroform, an ether spray tube, apparatus for embalming, a mask for workers in dust, a lethal chamber for painless extinction of the life of lower animals, &c. He has tried various new anæsthetics, and discovered the controlling influence of nitrite of amyl over tetanus. He has written and lectured on total abstinence, public health, and many medical and scientific subjects, and popularised many facts in sanitary science. He founded the *Journal of Public Health* in 1855 and the *Social Science Review* in 1862, and a quarterly journal, entirely written by himself, *The Asclepiad*, in 1861 and 1884 onwards. In 1868 he was presented with 1000 guineas and a microscope by 600 medical brethren and friends. He was knighted in 1893, and died 21st November 1896. See his autobiographical *Vita Medica* (1897).

His published works and essays are numerous, including *Cause of the Coagulation of the Blood* (1856); *Alcohol, its Action and its Use* (1869); *Cantor Lectures on Alcohol* (1875); *Hygeia, A Model City of Health* (1876); *Diseases of Modern Life* (1876); *Moderate Drinking* (1879); *A Review of the Life and Work of Edwin Chadwick* (2 vols. 1887); *Common Health* (1887); *National Health* (1890); *Life of Sopwith* (1891).

Richardson, CHARLES, lexicographer, was born in July 1775, studied law, kept school at Clapham, received in 1852 a pension of £75, and died October 6, 1865. His first work, *Illustrations of English Philology* (1815), led to his undertaking an English dictionary for the *Encyclopædia Metropolitana*, the first part of which appeared in January 1818. The project fell through, but Richardson's *New Dictionary of the English Language* at length appeared complete in two quarto volumes in 1837. The work was warmly

received—Trench styled it 'the best dictionary in the language'—and at that time it deserved the praise. A later work was entitled *On the Study of Language: an Exposition of Tooke's Diversions of Purley* (1854).

Richardson. Sir John, naturalist, was born at Dumfries, November 5, 1787, studied at Edinburgh University, became a navy-surgeon, served in the Arctic expeditions of Parry and Franklin (1819–22 and 1825–27), as well as in the Franklin search expedition of 1848–49, was knighted in 1846, married thrice, and died near Grasmere, June 5, 1865. The most valuable of his books were *Fauna Boreali-Americana* (4 vols. 1829–37) and *Ichthyology of the Voyage of H.M.S. Erebus and Terror* (1844–48). There is a Life by the Rev. John M'Ilraith (1868).

Richardson. Samuel, novelist, was born in 1689 in Derbyshire. Like Matthew Prior, he was the son of a joiner; but unlike him, he made no effort to obscure his origin. 'My father,' he said, 'was a very honest man, descended from a family of middling note. My mother was also a good woman, of a family not ungenteel.' His career is a curious exemplification of the truth of that Horatian precept which Thackeray chose for the motto of *Esmond*. It preserved to the end the characteristics of its outsetting. The man who was afterwards the moralist of Salisbury Court was as a boy the 'Gravity' and 'Serious' of his schoolfellows; the novelist who penned the interminable epistles of Clarissa and Harriet Byron was as a youth the favoured and indefatigable amanuensis of half the girls in the neighbourhood, acquiring in this artless office something of that strange knowledge of the minuter mechanism of the feminine mind which is so conspicuous a feature of his genius. He says of himself that he had only 'common school-learning;' but he appears to have been at Christ's Hospital. In 1706, at the age of sixteen, he was bound by his own wish to John Wilde of Stationers' Hall, a printer, with whom he served the usual period. Allington Wilde, whose daughter he married, was also a printer, but was quite a distinct person from his master. From 1713 to 1719 he worked as a journeyman printer. In the latter year he opened an establishment of his own in the centre, and later in the north-west corner (No. 11) of Salisbury Square, then Salisbury Court. His printing-office and warehouses were in Blue Ball Court, on the east side of the Square. In a sober, methodical way he continued to prosper, perfecting his faculty for letter-writing in various ways, and serving the humbler needs of literature by diligent compilation of prefaces, indexes, advertisements, and the like. He printed more than one newspaper, and by the favour of Mr Speaker Onslow obtained the printing of the journals of the House of Commons, twenty-six volumes of which passed through his establishment. Then, in 1740, came the opportunity which transformed him into a literary celebrity. To use his own words, 'he accidentally slid into the writing of *Pamela*.' He was over fifty when two booksselling friends invited him to prepare a volume of familiar letters 'in a common style, on such subjects as might be of use to those country readers who were unable to indite for themselves.' He caught at the idea, superadding another. 'Will it be any harm,' he said, 'in a piece you want to be written so low, if we should instruct them how they should think and act in common cases?' 'Hence sprung *Pamela*,' published in November 1740. Its title was as leisurely as its method: 'Pamela; or Virtue Rewarded. In a series of familiar letters from a beautiful young damsel to her parents. Published in order to cultivate the principles of virtue and religion in the mind of the youth of both sexes. A narrative which has its foundation in truth; and at the same time that it agreeably entertains by a variety of curious and affecting incidents, is entirely divested of all those images which, in too many pieces calculated for amusement only, tend to inflame the minds they should instruct.' The moral note is explicit enough on the good printer's title-page; but for all that *Pamela* is by no means *ad usum Delphini*. Its vogue, in a coarser and robuster age than ours, was nevertheless extraordinary. Not to have read of Richardson's exemplary heroine was 'as great a sign of want of curiosity, as not to have seen the French and Italian dancers.' Divines extolled her from their pulpits; Pope declared she would do more good than their discourses; fine ladies triumphantly exhibited her popular chronicles at places of amusement; and in remote country villages, when at last she was happily married, her rustic admirers set the bells a-ringing. In February followed a second edition: a third succeeded in March, and a fourth in May. Grub Street, fastening promptly upon this unexampled popularity, hastily put together for sequel a *Pamela in High Life*, which had the unfortunate effect of seducing Richardson into two supplementary volumes, now deservedly forgotten; and then Henry Fielding fluttered the Salisbury Court dovecote by producing what Richardson and his coterie regarded as the 'lewd and ungenerous engraftment' of *Joseph Andrews*. Happily, however, both for Richardson and posterity, he speedily discarded burlesque for the immortal character of Parson Abraham Adams.

Eight years elapsed before Richardson published another novel. But during this time, consoling himself for the coarse sallies of the irreverent by the 'soft adulation' of a little circle, chiefly of the gentler sex, who gathered round him in his suburban home at Hammersmith, he continued, either in his snug writing-closet or his summer-house, to work placidly at his masterpiece—*Clarissa; or the Adventures of a Young Lady*, known generally as *Clarissa Harlowe*. Virtue, in this performance, was not 'rewarded,' but ruined. The heroine is nevertheless drawn with a tenacity of insight to which *Pamela* could scarcely pretend; and the chief male character, that of Lovelace, though more of an abstraction, is scarcely inferior. Johnson declared the book to be the first in the world for its knowledge of the human heart; and even Fielding did not refuse his tribute: 'Such simplicity, such manners, such deep penetration into nature, such power to raise and alarm the passions, few writers, either ancient or modern, have been possessed of' (*Jacobite Journal*, No. 5). Lesser voices swelled the chorus with greater energy, and it was repeated across the Channel with Gallic enthusiasm. The high-priest of sentiment, Diderot, did not scruple to name its author with Homer and Euripides; and as if to prove that this was no momentary Anglomania, in our own day the poet Alfred de Musset proclaimed it to be 'le premier roman du monde.' But from France also came its compactest condemnation. 'La nature,' said D'Alembert, 'est bonne à imiter, mais non pas jusqu'à l'ennui.'

Having drawn the ideal woman in *Clarissa*, Richardson proceeded, some five years later, to portray, in *Sir Charles Grandison*, the perfect man—'the man of true honour.' This is a work of much greater ability than *Pamela*, but still far below *Clarissa*. It has, moreover, no central story strong enough to reconcile the reader to the prolix impeccability of its superfine hero, whom M. Taine, with an unwonted burst of critical levity, suggests should be stuffed and canonised for his wearisome good qualities. Besides a solitary essay in Johnson's

Rambler (No. 97), and the voluminous but not very interesting correspondence published (with an excellent memoir) by Mrs Barbauld in 1804, Richardson left no other literary remains of any importance. In later life a nervous habit grew upon him, which terminated in 1761 by a fit of apoplexy, of which he died. He has left his own protrait in his letters to Lady Bradshaigh (*Corr.* ii. 206, and iv. 290); but it might almost have been deduced from his letters. He was a sentimental, purring, methodical, well-meaning little man, domesticated and affectionate, whose fitting environment was feminine society of the sympathetic sort; and he has repaid the gentle caresses with which his worshippers tempered the wind of adverse criticism to his sensitive soul by depicting their sex in return with a patience, a discrimination, a sustained analysis of secret spring and motive which it has been given to no other male author, living or dead, to achieve. It is the most unequivocal testimony to his native genius that his impracticable method of telling his story by correspondence, and his intolerable circumstantiality and diffuseness (he thinks nothing of an epistle of fifteen pages, and Clarissa takes nineteen for her will) have served only to emphasise and intensify the reality of his creations.

See the reprint of the novels, with Mr Leslie Stephen's preface (1883), Mrs Barbauld's Life of Richardson (1804) and Miss Linklater's (1900); also the essays of Mrs Oliphant (*Blackwood*, March 1869), of Mr Buxton Forman (*Fortnightly*, xii.), of Mr H. D. Traill (*Contemporary*, xliv.), and of Mrs Andrew Lang (*National Review*, xiv.).

Richborough. See SANDWICH.

Richelieu, ARMAND JEAN DUPLESSIS, CARDINAL, DUC DE, one of the greatest statesmen of France, was born of a noble but impoverished family at Richelieu, 12 miles SSE. of Chinon, September 5, 1585. He abandoned a military career for the church, in order to keep in the family the bishopric of Luçon, to which he was consecrated at twenty-two. Representative of the Poitou clergy at the States-general in 1614, he attracted the notice of the queen-mother, and rose in 1616 to be secretary at war and foreign affairs: but the downfall of Marshal d'Ancre, the queen-regent's favourite, in April 1617, sent him back to his diocese. At length in August 1620 the queen-mother and the young king were reconciled, mainly through the agency of the celebrated Capuchin Father Joseph—'l'éminence grise' of later days, till his death in 1638 the intimate friend of Richelieu. The latter showed much tact and patient forbearance in his measures; he formed an alliance with the powerful Duc de Luynes, and in 1622 was named cardinal, in 1624 minister of state. This position he retained to the end of his life, in spite of countless court intrigues, and ere long the most powerful open and secret opposition from the queen, Gaston, Duke of Orleans, and a host of minor intriguers, first among whom was the too famous Duchess de Chevreuse. His first important measure was the blow to Spain of an alliance with England, cemented by the betrothal (1625) of the king's sister Henrietta with Charles, then Prince of Wales. In the Valtelline war he cleared the country of the Spanish and papal troops, but was unable to pursue his advantage, and had to submit to the terms of the peace of Monzon (1626). His next task was to destroy the political power of the Huguenot party. After a fifteen months' siege, which he conducted in person, concentrating all his energy upon the task, the great stronghold of La Rochelle was starved into submission, 30th October 1628. He next turned to crush Rohan and the Languedoc rebels, and destroyed the proud walls of Montauban, last refuge of Huguenot independence. Early in 1630 he entered Italy with a splendid army, himself in command, and soon reduced Savoy to submission. Meanwhile he plunged into dark and tortuous intrigues with the Italian princes, the pope, and with the Protestants of the north against the House of Austria. He promised a large subsidy to Gustavus Adolphus, and, through the masterly diplomacy of Father Joseph at the Ratisbon Diet in June 1630, succeeded in persuading Ferdinand to dismiss Wallenstein. The first treaty of Cherasco (April 1631) ended the Italian war, the second gave France the important strategic position of Pinerolo. Just before this final triumph Richelieu had successfully surmounted the greatest danger of his life—a great combination formed for his downfall by the queen-mother, Gaston of Orleans, the House of Guise, Bassompierre, Créqui, and the Marillacs. She tried to bully the king by her violence, but Richelieu followed his master to Versailles, and again had the whole power of the realm placed entirely in his hands. So ended 'the Day of Dupes' (11th November 1630). The queen-mother fled to Brussels, Bassompierre went to the Bastille, Gaston fled to Lorraine. The cardinal was now made duke and peer, and governor of Brittany. Further intrigues and attempted rebellions by the emigrant nobles and governors of provinces were crushed with merciless severity—Marillac and Montmorency and other nobles were sent to the block. Meantime Gustavus Adolphus had run his brief and brilliant course; and his death at Lützen removed an ally with whom it might have become difficult to reckon. In July 1632 Richelieu had seized the duchy of Lorraine. He continued his intrigues with the Protestants against Ferdinand, subsidising them with his gold, but till 1635 he took no open part in the war. In May of that year, after completing his preparations and concluding a close alliance with Victor Amadeus of Savoy, Bernhard of Saxe-Weimar, and the Dutch, he declared war on Spain, and at once placed in the field an army of 132,000 men. But his first efforts were singularly unsuccessful, and in 1636 Piccolomini and the Cardinal-Infante, governor of the Netherlands, entered Picardy, crossed the Somme, and threatened Paris itself. But in this hour of peril Richelieu rose to the height of his genius, and awoke a new and irresistible force as he threw himself upon the patriotism of France. With 30,000 foot and 12,000 horse he swept the enemy out of Picardy, while his ally Bernhard drove them across the Rhine, and in 1638 destroyed the imperial army in the decisive battle of Rheinfelden, a victory which opened to him the gates of the key-fortress of Breisach. The unexpected death of Bernhard threw the fruit of his victories into the hands of Richelieu, whose policy soon bore further fruit in the disorganisation of the power of Spain—revolts in Catalonia, and the loss of Portugal; the victories of Wolfenbüttel (1642) and Kempten (1642) over the Imperialists in Germany; and at length in 1641 in Savoy also in the ascendency of the French party. Another triumph that same year was the speedy collapse of the Imperialist invasion in the north by the Count of Soissons, who perished in the first battle. The failure to capture Tarragona was the one exception to the complete triumph of the cardinal's latest years.

But the hatred of the great French nobles to his rule had never slumbered, and Richelieu found safety alone in the king's sense of his own helplessness without him. He was firmly convinced that the only safe government for France was a strong absolutism uncontrolled either by the selfish ambition of the nobles or the constitutional legalism represented by the Parlement of Paris. The last conspiracy against him was that of the Grand-equerry, the young Cinq-Mars, whose intrigues with Gaston, the Duke of Bouillon, and the

Spanish court were soon revealed to the cardinal, the centre of a network of espionage which covered the whole of France. When the hour was ripe he placed in the king's hands at Tarascon proofs of the traitorous plot with Spain, and was given full powers as Lieutenant-general of the realm. Cinq-Mars and De Thou were at once arrested, and the wretched coward Gaston of Orleans hastened after his kind to buy his own security by betraying his accomplices. Cinq-Mars and De Thou were executed at Lyons in the autumn of 1642. But the great minister was himself dying in the hour of his greatest triumphs. Death had often drawn near him, but the strong will and fiery soul within his frail and feeble frame had thrust him aside and retained the fleeting life. He faced the inevitable at last with calm tranquillity—when the priest bade him forgive his enemies, he made answer, 'I have never had any other enemies than the state's.' We see the same unhuman impersonality in the identification of himself with the state in his *Mémoires*—'I have been severe to some in order to be good to all. . . . It is justice that I have loved and not vengeance. . . . I wished to give to Gaul the limits that nature had marked out for her . . . to identify Gaul with France, and wherever the ancient Gaul had been, there to restore the new.' He died 4th December 1642, bequeathing Mazarin to the king as his successor.

Richelieu built up the power of the French crown, he achieved for France a preponderance in Europe, and throughout life he moved onwards to his goal with the strongest tenacity of purpose, unmoved either by fear or pity. He destroyed the local liberties of France, and crushed every element of constitutional government, and his policy overwhelmed the citizens with taxation and made waste places some of her fairest provinces and most thriving towns. Our judgment of him will always differ according as we examine his end or his means—the public or the private man. He never sacrificed to personal ambition the interests of his country as these seemed to himself, but he often forgot in his methods the laws of morality and humanity. There is no need here to discuss the more fundamental question of whether his end was actually identical with the highest good of France—the best defence that even so redoubtable a Chauvinist as Henri Martin can offer is that he merely developed out to the full tendencies long rooted in French soil, and that no other ideal of a policy was then possible for France but a systematised absolutism under a beneficent despot. Nor have we sympathy to spare for the corrupt and selfish nobles whom he crushed with a severity so merciless that he drove twenty-one persons into exile, all of them the greatest names in France, banished sixty-five, several of these ladies, while seventy-three nobles were flung into prison, and forty-three were either beheaded or died in prison.

We know the face of Richelieu best from Philippe de Champagne's picture in the Louvre, in which the energy of the model had passed into the hand of the artist. A pale apparition, the mere ghost of a great man in Michelet's phrase, neither flesh nor blood, but all intellect, as Quinet said of Voltaire, he looks down upon us still with that steady and penetrating eye and that imperious gesture that overawed the king and the proudest peers of France. The weakest point in Richelieu's character was his literary ambition and the extraordinary pains he took to construct a literary reputation. His own plays, for the fate of which he trembled with anxiety, sleep in safe oblivion, but his *Mémoires* are still read with interest, forming a subtle and elaborate panegyric upon himself, so that Michelet says in his paradoxical manner, yet not without truth, 'If one would not know Richelieu, one should read his Memoirs.' He founded the French Academy. His Correspondence and State Papers, edited by d'Avenel, fill 8 vols. of the *Collection de Documents inédits sur l'Histoire de France* (1853–77).

See the article FRANCE; Capefigue, *Richelieu, Mazarin, et La Fronde* (2d ed. 1844), and *Le Card. de Richelieu* (1865); Dussieux, *Le Card. Richelieu* (1885); D'Avenel, *Richelieu et la Monarchie absolue* (3 vols. 1884–89); Hanotaux, *Histoire du Card. de Richelieu* (1893).

Richmond, an ancient municipal borough in the North Riding of Yorkshire, on the left bank of the deep-channelled Swale, 49 miles by a branch-line NW. of York. Its Norman castle (1072–1146), now utilised for barracks, stores, &c., has a very fine banqueting-hall and a keep 100 feet high. Other buildings are the parish church (restored by Scott, 1860), with good wood-carvings; Queen Elizabeth's grammar-school (1567; rebuilt, 1849–68); the market-house (1854); and the Perpendicular tower of a Franciscan friary, founded in 1258. The racecourse (847 feet above sea-level) commands a magnificent view. Till 1867 Richmond returned two members, and then till 1885 one. Pop. (1851) 4106; (1881) 4502; (1891) 4216. The earldom of Richmond was conferred by the Conqueror on his kinsman, Alan Rufus, son of the Count of Brittany, and, coming into the possession of the crown through John of Gaunt, was granted by Henry VI. to the father of Henry VII. Henry VIII. created his natural son, Henry Fitzroy (1517–36), Duke of Richmond, as Charles II. did his natural son, Charles Lennox (1672–1723), the ancestor of the present Duke of Richmond and Gordon.

See works by R. Gale (Latin, 1722), Clarkson (1821), Whitaker (2 vols. 1823), Robinson (1833), and Longstaffe (1852).

Richmond, a town of Surrey, 8½ miles WSW. of London (by rail 9½, by river 16), stands partly on the summit and declivity of Richmond Hill, and partly on the level right bank of the Thames. The Terrace, stretching along the brow of the hill, commands an unrivalled prospect of hill and dale, woodland and winding stream; and one of the fairest river-views in England may be gained from Richmond Bridge, which, 100 yards long, was built in 1774–77 at a cost of £26,000. Only a gateway remains of the ancient royal palace of Sheen, where died Edward III., Richard II.'s queen, Anne of Bohemia, Henry VII., and Elizabeth, and which was rebuilt by Henry V. and Henry VII. (1499), who renamed the place Richmond after his own former earldom. That palace, which has memories also of Wolsey, Charles V., and many others, was dismantled in 1648; but the splendid deer-park, formed by Charles I. in 1634, remains. It covers 2253 acres; and its brick wall is nearly 8 miles in circumference. Scott here makes Jeanie Deans have her audience with Queen Caroline. The well-known 'Star and Garter,' which dates from 1738, was largely destroyed by fire in 1870, but rebuilt in 1872–74 at a cost of £24,000; its banqueting-house escaped, built by Barry in 1865. At the parish church are buried the poet Thomson, Kean, Lady Di Beauclerk, and Dr John Moore; and here, too, Swift's Stella was baptised. St Mathias' (1858) is a striking building by Scott, with a spire 195 feet high; and there are also a Wesleyan theological college (1834), a free library (1881), &c.; whilst Richmond worthies other than those above mentioned have been Reynolds, Gainsborough, Collins, and Earl Russell. Market and nursery gardening is a chief industry. Richmond was incorporated as a municipal borough in 1890. Pop. (1861) 7423; (1881) 19,066; (1891) 22,684. See R. Crisp's *Richmond* (1866); *Round Richmond* (1881); and E. B. Chancellor's *Historical Richmond* (1885).

Richmond, (1) capital of Wayne county, Indiana, on the East Fork of Whitewater River, 69 miles by rail NNW. of Cincinnati, and 68 E. of Indianapolis. It was founded by the Society of Friends, who in 1859 established Earlham College here, for both sexes. There are manufactures of agricultural implements, machinery, boilers, flour, &c. Pop. (1880) 12,743; (1890) 16,608.—(2) Capital of Madison county, Kentucky, 120 miles by rail S. of Cincinnati. It is the seat of the Central University (Presbyterian; 1874) and the Madison Female Institute. Pop. (1890) 4737.

(3) The capital of Virginia, on the left bank of the James River (here crossed by a number of bridges), at the head of tide water, about 150 miles from its mouth, and 116 miles by rail S. of Washington. It is a port of entry, and vessels drawing 14 feet of water can come up to the lower end of the city, where there are large docks. Richmond is picturesquely situated on a group of hills, the summit of one—Shockoe Hill—being occupied by the capitol (1796), which contains valuable colonial archives and portraits; it possesses also a marble statue of Washington by Houdon, and in its grounds are statues of Henry Clay and 'Stonewall' Jackson, and the Washington monument, a noble bronze group by Thomas Crawford. Patrick Henry is buried in St John's churchyard, and President Monroe in Hollywood Cemetery, where also is a Confederate monument 90 feet high. Among other notable public buildings are the governor's mansion, the new city hall, custom-house and post-office, penitentiary, almshouse, and markets. In the city are Richmond College (Baptist; 1832) and the Virginia Medical College. The James River Falls here supply immense water-power, and in 1890 the city contained 783 manufacturing establishments, employing 21,618 hands, with a capital of $16,596,500. The chief of these are numerous tobacco-factories (employing 8792 people), great rolling-mills, iron-foundries, nail-works, machine- and locomotive-works, flour, meal-flour, and paper mills, and fertiliser-works. Five railways meet at Richmond, which is a terminus also of the James River and Kanawha Canal; and there are regular steamers to New York, Philadelphia, and Baltimore. The chief exports are cotton, flour, and tobacco. Richmond was founded in 1737, and became the capital in 1779. On 26th December 1811 the burning of a theatre destroyed the lives of sixty persons, including the governor of the state. In 1861 Richmond was selected as the Confederate capital, and from that period was the objective point of the Union armies in the east, and defended by General Lee with a large army and formidable lines of earthworks (which eventually extended for nearly 40 miles), until the seizure of the lines of supply by Generals Grant and Sheridan compelled its evacuation, after almost a year's siege and a series of sanguinary battles, on the night of April 2, 1865. A considerable portion of the city was burned by the retreating Confederates. But in the quarter of a century that followed Richmond recovered her old beauty, and more than her old prosperity and importance. In 1888 an 'agricultural, mechanical, and tobacco exposition' was held here. Pop. (1860) 37,910; (1870) 51,038; (1880) 63,600; (1890) 81,388. See the articles McClellan, Grant, Lee, United States.

Richmond, Legh, author of the *Dairyman's Daughter*, was born at Liverpool, 29th January 1772, and while a child was lamed for life by leaping from a wall. He studied at Trinity College, Cambridge, and was appointed in 1798 to the joint curacies of Brading and Yaverland in the Isle of Wight, in 1805 to the rectory of Turvey in Bedfordshire, where he died, 8th May 1827. He wrote *Fathers of the English Church* and *Domestic Portraiture*—memoirs of his three deceased children—and in a happier hour his *Dairyman's Daughter*, *Negro Servant*, and *Young Cottager*, three evangelical tracts which have carried his name over the world. Collected they form *Annals of the Poor* (1814). See the *Memoirs* by the Rev. T. S. Grimshawe (1828; ed. by Bishop G. T. Bedell. Phila. 1846).

Richter, Johann Paul Friedrich, usually known by his pen-name of Jean Paul (with the French pronunciation), Germany's greatest humorist, was born on the first day of spring (21st March) 1763, at Wunsiedel, a little town of the sequestered pine-clad Fichtelgebirge in North Bavaria. The imaginative boy was brought up in the idyllic sabbath-life of the mountain villages in which his father was pastor, went to school at the town of Hof, and in 1781 was sent to Leipzig University to study theology. But, like Lessing, he did not study theology; Rousseau and Voltaire, Swift and Sterne, Pope and Young, had much stronger attractions for him, and he too resolved to write books. He asserted his independence of custom by discarding the periwig and stiff necktie, wore his hair long, his shirt and vest open at the throat, and dressed him as he pleased. But he found it harder work to get bread than to write and assert his position as an 'emancipated' youth. Being poor, he got into debt all round, and in November 1784 fled secretly from Leipzig, to go and hide his head in the poverty-stricken home of his mother (a penniless widow since 1779) at Hof. His first literary 'children' were satires; but he could get no publisher to introduce them to the world, until in 1783 Voss of Berlin gave him forty louis d'or for *The Greenland Law-suits*. The book was a failure. For three years Jean Paul struggled on at home, his mother spinning hard for bread, he helping with the few florins he earned by his pen. He read enormously, omnivorously, and sat hours making excerpts from the books he devoured—a practice he kept up from early boyhood to old age. These many folios of closely-written pages were the storehouses upon which he drew for materials when he came to write his romances. He took long rambles amongst the hills and forests, his hair flying in the wind, a book in his hand or a song on his lips, and a favourite dog at his heels. In the beginning of 1787 he began to teach the children of different families in the district, and of course taught by original methods. All this time he still went on writing, and during his nine years of tutorship produced, amongst other things, the satirical *Extracts from the Devil's Papers* (1789), *Fälbel's Journey* (1796), and *Freudel's Complaint* (1796), the last two amongst the best examples of his satirico-humorous writings; the beautiful idylls *Dominie Wuz* (1793), *Quintus Fixlein* (1796; Eng. trans. by Carlyle, 1827), the *Parson's Jubilee* (1797), the first two perhaps the most finished things Jean Paul ever wrote; the grand romances *The Invisible Lodge* (1793), *Hesperus* (1795; Eng. trans. 1865), and *Flower, Fruit, and Thorn Pieces*, or *Siebenkäs* (1796–97; Eng. trans. by Noel 1844 and 1871, by Ewing 1877); *Campanerthal* (1797; Eng. trans. 1857), a series of reflections on the immortality of the soul, an undigestible book; and the prose lyrical idyll, *My Prospective Autobiography* (1799). *The Invisible Lodge* was his first literary success; *Hesperus* made him famous. In 1796 Charlotte von Kalb, perhaps the most remarkable, certainly the most advanced, woman of her age in Germany, wrote to express her admiration of the book; and a few months later, at her invitation, Jean Paul visited Weimar. There Goethe received him politely, but with cool reserve; that, too, was Schiller's attitude,

when Jean Paul went on to Jena to see him. The antagonism between them was deep and fundamental, and lasted till death, being at times but ill concealed by all three. Herder and his wife, on the other hand, greeted the young romance-writer with overflowing admiration, and gave him their friendship, which also endured till death. As for Charlotte von Kalb, she did not stop at friendship: in spite of having a husband already, she exercised her sex's fabled privilege of leap-year—her first letter to him was dated 29th February—and gave him unasked the love of her vehement heart.

From this time for a few years Jean Paul's life was rich in incident and full of excitement—an Odyssey of love adventures, in which he was the object of extravagant idolatry on the part of the women of Germany, especially of aristocratic dames who dabbled in literature. They gave him their love whether or no, and would have deserted husband and children for his sake; for, though not personally handsome, Jean Paul had a wonderful fascination of manner, particularly towards women. He found all women charming, he was a delightful talker and a good listener, and had a sweet and sympathetic smile—qualities that explain a good deal. In 1801 he married a Berlin lady, and three years later settled down at Bayreuth, attracted by its beauties of hill and valley, and by its beer. There he spent the rest of his days, leading a simple, busy life, writing his books, playing with his children, tending his pet animals, and taking short summer journeys to different towns of Germany; the present of a flower filled him with perfect joy. His last years were clouded by the death of his only son, a promising student, in 1821, and by his own blindness. From 1799 he enjoyed a pension from the Prince-primate Dalberg, and then from the king of Bavaria. He died on 14th November 1825. The principal works of his married life were the two grand romances, *Titan* (1800–3; Eng. trans. 1862) and *Wild Oats* (1804–5; Eng. trans. as *Walt and Vult*, 1849), the former accounted by himself and by most German critics his masterpiece, though Englishmen would generally prefer the latter, as they would certainly prefer *Siebenkäs* to *Hesperus; Schmeltzle's Journey to Flätz* (1809; Eng. trans. by Carlyle, 1827) and *Dr Katzenberger's Trip to the Spa* (1809), the best two of his satirico-humorous writings; the idyll *Fibel's Life* (1812); the fragment of another grand romance, *Nicholas Markgraf*, or *The Comet* (1820–22); a series of reflections on *Literature* (*Vorschule der Æsthetik*: improved ed. 1812), containing many excellent things about poetry, humour, wit, style; another series on *Education* (*Levana*, 1807; Eng. trans. 1848, 1876, and 1887), a book that ranks with Rousseau's *Emile* as a standard work on training the young, and is full of evergreen wisdom; various patriotic writings (1808–12); and an unfinished *Autobiography* (1826), the finest of all his idylls.

Jean Paul stands apart entirely by himself in German literature, a humorist of the first water, a Titan, 'a colossal spirit, a lofty and original thinker, a genuine poet [in prose], a high-minded, true, and most amiable man. . . . He advances not with one faculty, but with a whole mind, with intellect, and pathos, and wit, and humour, and imagination, moving onward like a mighty host, motley, ponderous, irregular, irresistible. He is not airy, sparkling, and precise, but deep, billowy, and vast' (Carlyle). Two irreconcilable tendencies strive for mastery in him and his works—a dreamy, lachrymose sentimentality, that shrank from the rough buffetings of life, and sought refuge in emotional dissipation, luxuriating in tears, caressing sorrow, coquetting with love, melting in melancholy longings for the world beyond the grave; and a sharp-eyed, wide-awake common sense, that saw workaday realities with the utmost clearness and discrimination. All his great qualities of imagination and intellect were, however, made ministers to his humour, which had the widest range, moving from the petty follies of individual men and the absurdities of social custom up to the paradoxes that are rooted in the permanent ordinances of the universe. He turns his irony—a tender, reverent, playful irony—upon all the relations of human life, even upon the holiest beliefs of his own heart. And, in spite of the egotism of genius that often shows itself so strongly in him, Jean Paul had the heart of a truly great and good man. Börne calls him the author *par excellence* of the lowly born, the poverty-stricken, the neglected, and the despised; to this class belong some of his finest characters, as Wuz, Fixlein, Siebenkäs, Vult. As a master of pathos he is put by De Quincey above Sterne. Few, if any, have written with such tender love and such delicate feeling of the idyllic joys of the country and the happiness of simple domestic life, particularly in the schoolhouse and parsonage. He had a wonderfully deep and sympathetic insight into the nature of woman, but has not created more than one lifelike woman (Lenette). Yet the male characters of his books, in so far as they are humorous, are generally living beings, or else, if secondary characters, well-drawn pencil sketches in outline. Jean Paul is the classic author of friendships (Siebenkäs and Leibgeber, Walt and Vult); he matched them with his own friendship for Hermann and Oertel, and for Otto and the Jew Emmanuel Osmund. Nature was to him a living and divine presence: he loved her reverently, from the solemn stars to the tiniest flower, and his descriptions of nature embrace some of the loftiest hymns the spirit of man has chanted to the beauty and sublimity of created things—e.g. several passages in *Hesperus* and *Wild Oats*, the Dream of the Universe in *Siebenkäs*. God and the immortality of the soul were the great facts ever present to his mind, influencing all his thoughts. An enduring sense of the ethic worth of human action, 'a noble reverence for the spirit of all goodness forms the crown and glory of his culture' (Carlyle). The reason why he is so little known, except by name, is that of all great writers he is one of the most difficult to read, and it may be added to understand. No reader who has not the strongest constitution can struggle through the tangled thickets of encyclopædic learning, the tortuous wit, the dreary wastes of digression and dullness, the hothouses of tropical sentimentality, amid which the gem-like gardens of his creative art are hidden. His prose is harder to translate than Heine's verse. For literary form, for order, harmony, or restraint he has not the slightest respect. The principal idea in his (often) long sentences is too frequently lost amid a labyrinth of subordinate clauses. The story is chiefly a peg for Jean Paul to hang Jean Paul's self-communings and reflections upon, a *point d'appui* for the play of his wit and humour. The wildest improbabilities, the wildest extravagances of fancy, are indulged in without check. Sentence follows sentence teeming with allusions, analogies, images, metaphors, similes, tumbling one over another in inextricable confusion. A Cræsus of idioms, he is the greatest and most prolific word-coiner in the language: he compels words to adapt themselves to his ideas. Often enough his diction is inflated and bombastic, and his literary taste execrable; yet when he is at his best his language marches with a majesty, a dignity, a natural beauty that are seldom matched in German literature. Carlyle's

Sartor Resartus and *French Revolution* are steeped in the spirit of Jean Paul, and show how greatly he fascinated the imagination of the rugged Scotsman.

The best editions of Jean Paul's *Werke* are the editions of 1860–62 (34 vols.), 1879 (60 parts), and 1882 *et seq.* (Kürschner's Deutsche National-Literatur series). The best complete Life, that by Nerrlich (Berlin, 1889), is marred to some extent by the Hegelian speculations of the writer. The more important biographical sources are *Wahrheit aus Jean Paul's Leben*, his Autobiography (1826), continued by Otto and Förster (1827–33); Spazier's *Biographischer Kommentar zu Jean Paul's Werken* (5 vols. 1833); Förster's *Denkwürdigkeiten* (4 vols. 1863); Correspondence between Jean Paul and Otto (4 vols. 1829–33), Charlotte von Kalb (1882), Jacobi (1828), and Voss (1833); and Fr. Vischer's *Kritische Gänge* (new series, vol. vi. 1875). In English the best accounts are contained in Carlyle's *Miscellaneous Essays* (vols. i. and iii.); De Quincey's *Analecta* of specimen passages translated (vol. xi. of *Collected Works*); and *Life of Jean Paul F. Richter* (1845). Lady Chatterton published a collection of translated extracts in 1859.

Richthofen, Ferdinand, Baron von, traveller and geographer, was born at Karlsruhe in Silesia, on 5th May 1833, was educated at Breslau and Berlin universities, and at the Geological Institute of Vienna (1856), and in 1860 accompanied a Prussian expedition to eastern Asia. The next twelve years he spent in travelling through Java, Siam, Burma, California, Sierra Nevada, and China and Japan (1868–72). After his return to Europe (1872) he was appointed president of the Berlin Geographical Society (1873–78), professor of Geology at Bonn (1875), and of Geography at Leipzig (1883) and at Berlin (1886). His reputation as a geographer is built principally upon his great work on *China* (Berlin, 4 vols. 1877–81), and upon *Die Metallproduktion Kalifornien* (1865), *The Natural System of Volcanic Rocks* (San Francisco, 1867), *Aufgaben und Methoden der heutigen Geographie* (1883), and numerous articles in geographical journals.

Ric'inus. See Castor-oil.

Rickets (according to Skeat, akin to A.S. *wringan*, 'to wring'), or Rachitis (Dr Glisson's pseudo-Greek coinage in 1650 from Gr. *rhachis*, 'the spine,' because a peculiar form of spinal curvature results therefrom), is a disease of children, chiefly characterised by the imperfect development, softness, and consequent distortion of some or many of the bones. The bones thus affected consist of a sort of gelatinous tissue, which will bend without breaking; and they are so soft that they may be cut with the knife. Though so soft, they are thickened, especially at the parts where growth normally takes place most rapidly; the enlargement of the wrists, ankles, &c. which results has led to the term 'double-jointed,' often applied to those suffering from the disease. The weight of the body and the traction of the muscles acting on bones thus constructed cause them to bend, and the thighs or shins are abnormally arched, or the spine is curved, or, in slighter cases, only the normal form of the ankle is modified. In aggravated cases the chest is so affected as to give rise to the condition known as 'pigeon-breasted;' the lower jaw is imperfectly developed, and the teeth project; and the pelvis becomes so altered in form as, in the case of girls, to render future childbearing in the highest degree perilous. Rickets is exclusively a disease of childhood, and rarely begins later than the second year. It appears to be caused by unhealthy surroundings, particularly defective or improper food, and insufficient light and air. It is therefore much more common among the poorer classes, and in towns. It is not due in most cases to the want of lime-salts in the food, but to the want of power in the child's system to assimilate them. In some of the large cities of Europe one-third or even a larger proportion of the children brought to the out-patient departments of hospitals are more or less affected. It is a very chronic disease, and if at all severe leaves its mark on the bones for life. It is very rarely fatal of itself; but affected children are much less able than others to resist attacks of other diseases (bronchitis, diarrhœa, hooping-cough, measles, &c.). In Germany this malady is, under an old misapprehension, called the 'English disease.'

The treatment must be mainly directed to the improvement of the general health. Free exposure to pure bracing air, sponging with sea-water, or sea-bathing if the little patient can bear it, an abundance of suitable and nourishing food, cod-liver oil, iron, and quinia include all that need be said about general treatment. The administration of lime-salts seems to do little good, though it might naturally be thought the one thing needful. While the bones are still soft great care must be taken to keep the child in such attitudes as will cause the least possible strain upon the affected parts. When the bones have become ossified in faulty positions surgical interference may often be useful in producing amelioration of the condition.

Rickman, Thomas, an English architect, was born at Maidenhead in Berkshire in 1776. He was undecided as to a calling, being in succession chemist, grocer, corn-factor, and insurance agent. But he seems to have always had a love for architecture, and to have studied it carefully. Having sent in a design for a church that proved successful in a government competition, he settled at Birmingham as an architect. He designed a great number of Gothic churches and chapels—e.g. in Birmingham, Hampton Lucy, Bristol, Preston, Carlisle, &c., many country-houses, and the New Buildings of St John's College, Cambridge. He died in March 1841. His *Attempt to discriminate the Styles of Architecture in England from the Conquest to the Reformation* (1817; 6th ed. by J. H. Parker, 1862) is still a standard authority.

Rickmansworth, a town of Hertfordshire, at the confluence of the Colne, Gade, and Chess, 4 miles W. by S. of Watford. It has a church (rebuilt in 1890) with interesting monuments; and near it is Moor Park, the seat of the ill-fated Duke of Monmouth. Pop. of parish (1881) 6211; (1891) 7672. See R. Bayne's *Historical Sketch* (1870).

Ricochet, in Artillery, is the bounding of a shot along the ground which takes place when a gun is fired low. Intentional ricochet firing was first introduced by Vauban at Philipsburg in 1688, believing it to have great actual and moral effect in clearing the face of a ravelin, bastion, or other rather long line of fortification.

Ricord, Philippe, a French physician, was born on 10th December 1800, at Baltimore, U.S. He came to Paris in 1820, and after 1828 delivered there two annual courses of lectures at the Pitié on surgical operations, and was appointed surgeon-in-chief to the hospital for venereal diseases. This post he held till his retirement in October 1860. He died on 22d October 1889. Ricord won a world-wide reputation in the specialty which he had chosen, a reputation which he owed to his combination of accurate physiological and pathological knowledge, manual dexterity as a surgeon, and felicitous inventiveness and resource as a physician.

The more important of his numerous works are *On the Employment of the Speculum* (1833); *Treatise on Venereal Maladies* (1838); *On Blennorrhagic Ophthalmia* (1842); *Iconographical Clinic of the Venereal Hospital* (1841–66); *Letters on Syphilis* (3d ed. 1863); and *Lectures on Cancer* (2d ed. 1860).

Riddles (A.S. *rédelse*, from *rédan*, 'to interpret'), or SENSE-RIDDLES, to adopt Dr Tylor's phrase, have been defined as 'roundabout definitions of the hearer has to guess what.' They were widely popular in dim antiquity, as to-day they are popular among many half-civilised races—not absolute savages, for to perceive an analogy demands some measure of culture. They may be broadly divided into two classes—riddles admitting of more or less easy solution, and riddles whose solution is beyond any wit of man, unless indeed, as is very often the case, the answer is known already. To the former class belong the enigma propounded by the Sphinx to Œdipus (q.v.), and that which, according to Plutarch, Homer died of chagrin at not being able to answer. It seems to us easy now, for it was the one about the two boys who went hunting: all they caught they flung away, and all they could not catch they carried home. Of insoluble riddles Samson's is a good instance, and this which, in a Russian folk-tale, is put by 'Boots' to the princess: 'As I came to you I saw on the way what was bad, and I struck the bad with a bad thing, and of what was bad the bad died.' Naturally the princess could not guess that he had killed a snake with his lance; she gave it up, and had to marry him. Such propounding of riddles for wagers (her hand to his head in this instance) meets us frequently. Josephus relates how Solomon and Hiram, king of Tyre, once had a contest, in which Solomon first won a large sum of money from Hiram, but presently lost it all back to Hiram's subject Abdemon. The Queen of Sheba, again, came to pose the wise king with enigmas ('venit tentare eum ænigmatibus,' so it runs in the Vulgate); the trials of skill between Virgil's shepherds are a standard classical instance; and, to come down to later times, the Russian folk-tale has many analogues in other folklores and in our own ballad minstrelsy—e.g. in 'Proud Lady Margaret,' 'Captain Wedderburn,' and 'The Elfin Knight.'

The riddle is found in the Koran, and several collections of riddles exist in Arabic and Persian. They were, it seems, also known to the ancient Egyptians, while among the Greeks they were allied in the earliest times with the oracular responses, and, like Samson's riddle, were generally in poetical form. But in Greece they first came into vogue about the time of the 'Seven Sages,' one of whom, Cleobulus, was celebrated for the composition of metrical *griphoi*. Even the greater poets did not disdain to introduce them into their writings, or to devote whole poems to the subject—e.g. the *Syrinx*, commonly ascribed to Theocritus. Appuleius wrote a *Liber Ludicrorum et Griphorum*, but it is lost; and almost the only name we can fix upon is a certain Cælius Firmianus Symposius, whose riddles, comprising a hundred hexameter triplets, are termed by St Aldhelm 'rubbish' ('carmina inepta').

The riddle, but more perhaps as an amusement for the baronial hall on winter nights, or for the monkish refectory, than as a serious intellectual effort, was much cultivated during the middle ages. Many French, English, and German riddle-books exist in MS., and some were printed at an early period. Wynkyn de Worde's *Demaundes Joyous* (1511) contains several riddles that are simply coarse jests; but others, again, well illustrate the simple faith of mediæval Christendom—e.g. '*Demand:* What bare the best burden that ever was borne? *Response:* The ass that carried our Lady when she fled with our Lord into Egypt.' The Reformation checked, if it did not wholly stop, the merry pastime of riddle-making; but in France, in the 17th century, it began to creep back into favour, until at last riddles rivalled in popularity the madrigals and sonnets of the period. Le Père Menestrier, in 1694, wrote a grave treatise on the subject; and before that, in 1646, the Abbé Cotin had published a *recueil*, in the preface to which he modestly dubbed himself 'le Père de l'Enigme.' 'Posterity,' adds a French critic, 'has not recognised his paternity.' The taste for riddle-making grew and grew, and many brilliant French writers, such as Boilean, Voltaire, Madame du Deffand, and Rousseau, did a little in this line, until finally the *Mercure de France* became a fortnightly repository of riddles, the solution of which secured a reputation in society. In Germany we have Schiller's delightful extravaganza, *Turandot;* and in England Cowper, Fox, Canning, and Praed are a few of the makers of poetical riddles or Charades (q.v.). To-day with us the riddle is a mere *jeu d'esprit*, a conundrum or pun couched question-wise; but among the Irish, German, and Russian peasantry, the Gypsies, the Zulus, the Samoans, and many more races, the old-fashioned sense-riddles, often enshrining a mythological germ, still hold their own. Thus, 'in the government of Pskov, on the occasion of a marriage, the bridegroom and his friends are not allowed to enter the bride's cottage until they have answered all the riddles her friends put to them; and in one of the villages in the Jaroslav government a bargain of which the bride is the subject is concluded between the groomsman and the "seller of the bride"—riddles, answered by gestures, instead of words, taking the place of coin.'

See chap. iii. of Tylor's *Primitive Culture* (1871); Ralston's *Songs of the Russian People* (1872); two articles in *Once a Week* (1868); one by D. Fitzgerald in the *Gentleman's Magazine* (1881); Friedreich's *Geschichte des Räthsels* (1860); Rolland's *Devinettes ou Enigmes Populaires*, with a preface by Gaston Paris (1877), and a bibliography of fifty other works; and Bladé's *Proverbes et Devinettes de la Gascogne* (1886).

Riding (Scand. *thriding* or *triding*, 'third part'), a term applied to the three parts into which the county of York is divided, termed respectively East, West, and North Riding. A similar division existed in several other counties in the Anglo-Saxon period, as the *laths* of Kent, the *rapes* of Sussex, the *parts* of Lincoln. In *Domesday Book* Yorkshire was divided, as at present, into three ridings, and subdivided into wapentakes.

Riding and Driving. The art of riding may be divided into (1) ordinary riding, (2) school riding, (3) circus riding, and (4) side-saddle riding. The two objects aimed at in *ordinary riding* (which includes riding on the road, hunting, pig-sticking, stock-driving, breaking in young and freshly handled horses, playing polo, race and steeplechase riding) are to remain in the saddle and to make the animal carry its rider with the greatest possible ease to itself. The former of these objects is the one almost entirely aimed at by the breaker when giving his first lessons; the latter, by the flat-race jockey. Hence we find that the saddle and seat adopted by the Colonial buckjumping rider are those that are best suited for 'sticking on.' The large pads on the flaps of his saddle are about six inches deep, and are curved backward, so as to fit against his thighs, a little above the knees, in a manner similar to that in which the third crutch (or leaping head) acts on the lady's left leg in a side-saddle. The seat of the jockey, instead of being that in which most security can be obtained, is the one by which the rider can best conform to the movements of his mount. Hence we find that, even in Australia, many of the best jockeys on the flat are but very poor performers on a buckjumper. In all kinds of riding balance rather than grip should be the chief means for retaining one's seat in the saddle, for if muscular

action be constantly employed to 'stick on' the muscles then brought into play will soon become tired, and will be unable to act at the very moment their aid is most required. One valuable rule in riding is that, except when applying the leg to the animal's side, the leg from the knee down should remain unaltered in its position, so that neither knee nor foot will work backwards or forwards. The movements of the upper part of the body should be regulated by the play of the hips. There should be no hollowing out of the small of the back or pushing out of the chest, or any other action which would give rigidity to the muscles. The great reason why any approach to stiffness, when riding, should be avoided is that it has to be maintained by muscular effort and is consequently followed by fatigue. As soon as the muscles become tired they are weak and slow to act. Consequently, if they be kept stiff (or, more correctly speaking, in a contracted condition) they will be unable to do any work they may be called upon to perform in as effective a manner as they would do were they kept lissom. Hence a person should ride, as a rule, by balance and not by grip, until the moment comes to put forth the required muscular effort. The rider should endeavour to avoid the two very common faults of holding on by the reins and of putting too much weight on the stirrups, and he should try to ride with his seat well under him and not stuck out behind. If he find that he is insecure in his saddle he should allow no false shame to prevent him from getting one in which he will have a firmer hold. To give this additional grip the saddle may be covered with buckskin, or with leather the rough side of which is put on the outside. The saddle should be roomy. The back part, upon which the seat rests, should be fairly flat; the seat ought to have a good 'dip' in it; and there should be tolerably large 'rolls' on the flaps. To become a good rider one will require plenty of practice, and a frequent change of horse and saddle. The English style of riding, which has been adopted with marked success in the hunting-field, racecourse, steeplechase-course, and polo-ground, is treated clearly and systematically in Captain Hayes's *Riding* (Thacker & Co., 3d ed. Lond. 1891). There is also much valuable advice given in that excellent work, Colonel Greenwood's *Hints on Horsemanship* (Moxon & Co., London). In the Badminton Library book on *Riding* (Longmans, Green, & Co.) this subject is treated from the old-fashioned riding-school point of view, at which we shall presently glance.

In *school riding* the object of getting the horse to carry his rider with the greatest possible ease to himself, which is the chief aim of the ordinary rider, is sacrificed to a large extent for increased control, so as to get the horse to perform the various *airs de manège* with precision. The English military riding system is a kind of compromise between that of the continental *haute école* and the English hunting style. Although great improvements have been made in high school riding in France and Germany, the riding instruction contained in *The Cavalry Regulations* has remained practically unaltered for the past thirty years. M. Baucher, we may remark, was the great master of school equitation of the previous generation. His system has been much modified for the better by Captain Raabe and M. Fillis, although these masters differ in some details from each other. M. Barroil's *Art Équestre* (Rothschild, Paris) is moulded on the teaching of Raabe. *Principes de Dressage and d'Équitation* (Marpon and Flammarion, Paris), by M. Fillis, contains all his views. Both are most valuable works on *l'équitation savante*, and should be carefully studied by the student. Previous to their appearance Mr E. L. Anderson wrote *Modern Horsemanship* on the same subject; but it is neither so elaborate nor so instructive as either of the other two, which ought to be read conjointly. Of the two we prefer that of M. Fillis, especially as he teaches that the horse should carry his head in a freer and less fatiguing style than that advised by M. Barroil, who in this respect follows the instruction of Baucher. In M. Fillis's book there are some valuable *commentaires sur Baucher*.

Although exhibitions of school riding are often given in a circus, we must separate it from *circus riding*, which, properly speaking, is limited to performances (standing, leaping, dancing, and tumbling) in an upright position, either on a pad or on the bare back of a horse. The only part which we could term riding, in the usual sense of the term, is the 'bounding jockey act,' in which the 'artist,' while riding round the ring, takes off his saddle, stands on it, gets off his horse, and jumps astride on him and on top of his back while the animal is galloping round.

In *side-saddle riding* the lady depends for security of seat on balance and on the grip she has on the upper and lower crutches. Her right leg is placed over the former, and she presses her left leg, a little above the knee, against the latter when she seeks their aid. Her left foot should not be placed 'home' in the stirrup, but only as far as the ball of the foot; and the heel should be slightly depressed. If, when her left leg is held in this manner, she can just feel the pressure of the lower crutch, the length of her stirrup will be about right. The only pace at which she should put weight on the stirrup is the trot. The great requisite for obtaining a 'square' seat, which is the one correct position for a lady on horseback, is for the rider to put her weight on her right leg, and not equally on both, as is often wrongly advised, and to bring the left shoulder up as much as the right. The body should be free from all stiffness, and should be kept erect by the play of the hip-joints, and not by hollowing out the small of the back and pushing out the chest. She should try to get her seat well under her. We would strongly advise the use of the 'Scott stirrup,' which will always release the foot in the event of a fall. The best book on ladies' riding is *The Horsewoman* (Thacker & Co., London), by Captain and Mrs Hayes. French ideas on ladies' riding are expounded in *L'Amazone* (Rothschild, Paris), by M. Musany.

The art of *driving* is studied in Great Britain chiefly with the view of having the horses in perfect control, which is necessitated by the hilly nature of the country and by the crowded condition of the thoroughfares in the cities and towns. In America and Australia there are better opportunities for fast driving. Hence in England a showy style of trotting is sought for, while speed is more thought of in the United States and in the Antipodes. Although strenuous efforts are being made to establish trotting as a sport in Britain, and trotting meetings are often held at the Alexandra Park, Liverpool, and elsewhere, we greatly doubt whether it will obtain any permanent footing.

The best books on driving are *Driving* (Badminton Library); *Riding and Driving*, by J. H. Walsh; *Coaching*, by Lord W. P. Lennox; *Down the Road*, by C. T. Birch-Reynardson; *American Trotters*, by Hiram Woodruff; and *Among the Trotters*, by John Splan. See also the articles BRIDLE, COACHING, FOXHUNTING, HORSE-RACING, and TROTTING.

Ridley. NICHOLAS, Protestant martyr, was born about 1500, of good Northumbrian stock. From the grammar-school of Newcastle-upon-Tyne he passed to Pembroke Hall, Cambridge, became fellow in 1524, and master in 1540. The spirit of the Reformation had already begun to penetrate

both universities; Tyndale and Bilney had taught the new doctrines at Cambridge, and Ridley, no less than Cranmer and Latimer, Cambridge students about the same period, had early caught something of their spirit. Ridley went next to Paris and to Louvain, and, having encountered some of the most active Reformers abroad, after a three years' absence returned firmly grounded in the new doctrines. He was made proctor to the university of Cambridge in 1533, became domestic chaplain to Cranmer, afterwards to the king, and had already been made vicar of Herne, canon, first of Canterbury, then of Westminster, and rector of Soham, when in 1547 he was raised to be Bishop of Rochester. An ardent and outspoken Reformer, yet without either bigotry or intolerance, he brought great learning and admirable preaching power to the cause, and quickly made himself one of the foremost leaders of the church. On the deprivation of Bonner, Bishop of London, in 1550, Ridley became his successor. In this high position he distinguished himself by his moderation, his learning, and his munificence, prompted Edward VI. to the foundation of Christ's, St Bartholomew's, and St Thomas' hospitals, and assisted Cranmer in the preparation of the Forty-one Articles, afterwards reduced to thirty-nine. In 1552 he visited the Princess Mary at Hunsdon, but failed to shake her adherence to her mother's faith. Thereupon, after the death of Edward VI., he warmly espoused the cause of Lady Jane Grey, and at St Paul's Cross declared both Mary and Elizabeth to be illegitimate, July 16, 1553. As soon, however, as Mary was proclaimed he repaired to Framlingham to make his peace, but was coldly received, and soon stripped of his dignities and sent to the Tower. Once at least he attended mass, but his spirit soon returned to him. In March 1554 he was sent to Oxford, together with Latimer and Cranmer, to be tried by a committee of convocation, and after a profitless disputation all three were adjudged defeated and obstinate heretics, and condemned to suffer at the stake. As England was not yet formally reconciled to Rome, the sentence could not be carried out, and accordingly Ridley lay in Bocardo gaol at Oxford for eighteen months, writing the while a noble and touching farewell letter to his friends. After the formality of a second trial he was led forth to execution, along with Latimer, 16th October 1555. The stake was placed in front of Balliol College, and here Ridley played the man in the midst of awful torments of a smouldering fire that burned him slowly to death. His writings were collected in a volume of the Parker Society series (1841), with a life by Rev. H. Christmas. See his Life by Dr Gloucester Ridley (1763)

Riehm, Eduard (Karl August), a learned Protestant theologian, born at Diersburg in Baden, December 20, 1830. He studied at Heidelberg and Halle, became vicar at Durlach in 1853, garrison-preacher at Mannheim in 1854, and qualified as *privat-docent* in the theological faculty at Heidelberg in 1858. He was appointed an extra-ordinary professor here in 1861, at Halle in 1862, and ordinary professor at the latter in 1866. He died April 5, 1888. Of his numerous books most important are *Der Lehrbegriff des Hebräerbriefs* (1858–59; 2d ed. 1867); *Die Messianischen Weissagungen* (1875; 2d ed. 1886; Eng. trans. 1890); *Der Begriff der Sühne im Alten Testament* (1877); and the posthumous *Alttestamente-Theologie* (ed. by Palmcke, 1890) and *Einleitung in d. Alte Testament* (ed. by A. Brandt, 2 vols. 1889–90). He edited the second edition of Hupfeld's *Commentary on the Psalms* (4 vols. 1867–71) and the invaluable *Handwörterbuch des biblischen Alterthums* (1884), and was from 1863 joint-editor of the quarterly *Theologische Studien und Kritiken.*

Riel, Louis, a Canadian insurgent, born in Manitoba in 1844, became a leader of the Metis, or French half-breeds, and headed the Red River rebellion in 1869–70, afterwards escaping from the country. In 1885 he again established a rebel government in Manitoba, and in November, the rising having been quelled, he was executed at Regina.

Rienzi, Cola di, the famous Roman tribune, was born at Rome in 1313. His parentage was humble, his father being a tavern-keeper named Lorenzo, by abbreviation, Rienzo; the family name of Gabrini is sometimes added. The son Nicolas (shortened into Cola) studied grammar and rhetoric, read and re-read the Latin historians, philosophers, and poets (Greek was scarcely yet known in Italy), and excited his imagination, while at the same time he coloured his speech, with the prophetic enthusiasm of the inspired writers. The assassination of his brother by a Roman noble, whom he found it impossible to bring to punishment, finally determined him to deliver the city from the barbarous thraldom of the barons. In 1343 he was appointed by the heads of the Guelph party spokesman of a deputation sent to the papal court at Avignon to beseech Clement VI. to return to Rome in order to protect the citizens from the tyranny of their noble oppressors. Here he obtained a favourable hearing from the pope, who appointed him notary to the civic chamber. In April 1344 Rienzi returned home, and sought to obtain the countenance of the magistrates in his ideas of reform; but reform he found was impossible without revolution; and for three years he loudly and openly menaced the nobles. At last, when Rienzi thought he could rely on the support of the citizens, he summoned them together on the 28th of May 1347, and, surrounded by 100 horsemen and the papal legate, he delivered a magnificent discourse, and proposed a series of laws for the better government of the community, which were unanimously approved of. The aristocratic senators were driven out of the city, and Rienzi, as tribune of the holy Roman republic, was invested with practically dictatorial power. The pope confirmed the eloquent dictator in his authority; all Italy rejoiced in his success, and foreign lands, even warlike France (according to his enthusiastic friend and admirer, Petrarch), began to dread the reviving majesty of the Eternal City. A bright dream flashed across Rienzi's imagination, the dream of every great Italian from Dante to Mazzini—the unity of Italy and the supremacy of Rome! Rienzi despatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and, on the 1st of August 1347, 200 deputies assembled in the Lateran Church. Rienzi was crowned tribune with great ceremony on the 15th April. But the nobles were still bitterly hostile; Rienzi, who defeated them in a bloody battle on the 20th November, became suddenly infected with the insolence of victory and power, and proceeded to levy taxes and enforce obedience. The papal authority was turned against him; after a short reign of seven months he lost heart at the combination of forces against him, and fled to Naples.

After two years of religious meditation among the mountains of the Abruzzi, Rienzi resumed his life as political reformer, and went to Prague to secure the support of the emperor, Charles IV. Charles, however, sent him as a prisoner to Pope Clement VI. to Avignon, but by the mediation of Petrarch he was released from imprisonment. A new pope,

Innocent VI., resolved to take advantage of Rienzi's old popularity in order to crush the power of the Roman nobles, now becoming troublesome, and sent him to Rome in the train of Cardinal Albornoz. Their mission was swiftly accomplished, and the power of the nobles overthrown again. Rienzi aimed, however, at re-establishing himself in supreme authority. In August 1354, having borrowed money and raised a small body of soldiers, he made a sort of triumphal entry into Rome, and was received with universal acclamations. But misfortune had impaired and debased his character; he abandoned himself to luxurious living, and his once generous sentiments had given place to a hard, mistrustful, and cruel disposition. The barons refused to recognise his government, and fortified themselves in their castles. The war against them necessitated the contraction of heavy expenses; the people grumbled; Rienzi only grew more severe and capricious in his exactions and punishments. He even murdered the free captain, Fra Monreale, for his wealth. In two months his rule had become intolerable, and on the 8th of October an infuriated crowd surrounded him in the Capitol, and put him to death with ferocious indignities.

The fortunes and fate of Rienzi have been made the subject of a romance by Lord Lytton, and of an opera by Wagner. See monographs on Rienzi by Papencordt (Hamburg, 1841), Auriac (Amiens, 1885), and Rodocanachi (Paris, 1888); and the histories of Mediæval Rome by Gregorovius and Reumont.

Riesengebirge (i.e. 'Giant Mountains'), a mountain-range about 23 miles long by 16 broad, separating Bohemia from Prussian Silesia. Seen from Silesia on the north they look like a gigantic wall of rock, pierced at places by deep ravines. On the south they fall away more gradually. The highest peak is the Schneekoppe (5260 feet), the loftiest mountain in this part of Europe. Granite and crystalline schists, especially mica-slate, are the principal geologic constituents of the range. There are only three passes: one in the east, with a railway, from Landeshut in Silesia to Trautenau in Bohemia; one in the west, from Hirschberg to Reichenberg; and one in the middle, from Hirschberg to St Peter in the upper Elbe valley in Bohemia. These mountains are a favourite tourist resort of the Germans. They figure in popular legend as the home of the mountain-spirit Rübezahl, called also 'Herr Johannes,' who rules the weather. See Meyer's *Reisehandbuch* by Letzner (6th ed. 1888); and *Rübezahl, seine Begründung in der deutschen Mythe* (Prague, 1885).

Riesi, a town of south Sicily, 10 miles NW. of Terranova, has sulphur-mines and makes wine and olive-oil. Pop. 11,914.

Rieti (ancient *Reate*), a city of Central Italy, 40 miles NE. of Rome, is walled, and presents a mediæval appearance; it has a fine cathedral with a monument by Thorwaldsen. Pop. 9618.

Rievaulx Abbey, situated 26 miles N. of York and 10 E. by N. of Thirsk, is a ruined edifice, Norman and Early English in style, originally built for the Cistercian order by Walter l'Espec in 1131. The ruins consist of the choir and transepts of the church, with a choir-arch 75 feet high, the refectory, and the gate-house. They occupy a beautiful site in the valley of the river Rye; 'Rievaulx' is but a Norman-French translation of 'Rye vale.' At the dissolution this was one of the richest foundations in Yorkshire.

Riff, a name given to the coast districts of northern Morocco extending from Ceuta to the western frontier of Algiers, and forming a line of steep cliffs with few harbours. Its Berber inhabitants were formerly much addicted to savage piracy.

Rifle-bird (*Ptilorhis paradiseus*), often spoken of as one of the 'Birds of Paradise,' is perhaps the best-known species of a genus which, according to Elliot, comprises four species confined to Australia and to New Guinea. *Ptilorhis paradiseus* inhabits the south-eastern districts of Australia, and is found only in very thick 'bush.' The male is regarded as more splendid in plumage than any other Australian bird. The upper parts are velvety

Rifle-bird (*Ptilorhis paradiseus*).

black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female, as is often the case, is much duller coloured than her mate. See HONEY-EATER.

Rifles. The object of rifling any weapon, whether cannon or small-arm, is for the purpose of causing the projectile, when fired from such weapon, to rotate round its axis, and thus to impart steadiness to it in its passage or flight through the air. The subject of rifled cannon has already been dealt with under the head of Cannon (q.v.); in this article, therefore, it is intended to deal only with the question of rifles as applied to small-arms, whether military or sporting. The idea of imparting steadiness to the projectile and thereby increasing the accuracy of fire is one which has exercised the minds of scientific artillerists and gunmakers from a very early period in the history of firearms. The cause of inaccuracy when firing a spherical ball from a smooth-bore firearm may be briefly explained as follows: in all muzzle-loading arms the projectile must be smaller in diameter than the bore of the gun, otherwise it could not enter and be rammed home from the muzzle; the projectile therefore rests on the bottom of the barrel, and its centre is below the axis of the bore. When the gun is fired part of the gas generated by the explosion of the powder escapes over the top of the ball, causing a downward pressure on it; as this pressure is removed during its passage down the barrel the ball impinges on the top side of the barrel, and so on, up and down and from side to side, until it leaves the muzzle of the gun; the direction of its flight is therefore not in line with the axis of the bore, but is determined by its last impact against the side of the barrel. To overcome this inaccuracy the idea suggested itself to cut grooves in the bore of the barrel which by gripping the ball would cause it to rotate round its axis and to leave the barrel more nearly in line with the axis of the bore.

Copyright 1891 in U.S. by J. B. Lippincott Company.

The first authenticated instance we have of a rifled small-arm being actually used was in the year 1563, when the Swiss government issued an edict to the following effect: 'For the last few

years the art of cutting grooves in the chamber of the guns has been introduced with the object of increasing the accuracy of fire; the disadvantage resulting therefrom to the common marksman has sown discord amongst them. In ordinary shooting matches marksmen are therefore forbidden under a penalty of £10 to provide themselves with rifled arms. Every one is nevertheless permitted to rifle his military weapon and to compete with marksmen armed with similar weapons for special prizes.' In the later half of the 16th century Augustus Kutter of Nuremberg brought out a rifle the grooves of which were in a spiral form, and to him is due the idea of this form of rifling. In 1662 a cleric, the Bishop of Munster, invented elongated projectiles for use in such arms, but whether in conjunction with a rifled arm or simply with the idea of improving the accuracy of a smooth bore is not known. In 1729 Lautmann, a Russian, brought out a pamphlet advocating the advantage of firing with balls of an elliptical form with a cavity at the base so as to augment considerably the impetus imparted to the projectile when fired from a rifled arm. Lautmann undoubtedly hit upon the true theory, and had his idea been worked out to a practical result the armies of Europe would in all probability have been armed with rifles a hundred years sooner than they actually were. But Lautmann, like so many other inventors, was in advance of his age and did not live to see the correctness of his theory vindicated.

In 1750 Wild brought out a rifle with six grooves having one turn in the length of the barrel, from which he fired balls weighing eighteen to the pound, wrapped in an envelope of greased linen, the object of the linen being to fill up the bore and to impart the necessary rotatory motion to the bullet; but nothing came of his invention. And again in 1770 experiments, which were not successful, were made at Metz with elongated bullets.

The adoption of rifles into the British service dates from about the year 1800, when the old 95th Regiment, which later became the Rifle Brigade, were armed with 'Baker's rifles,' so called from the name of the inventor. There were two patterns of this arm, one with eleven and the other with seven grooves, the twist of rifling being one turn in 136 inches. The weight of the rifle was 8 lb. 9 oz. and its length 3 feet 9¾ inches; the length of the barrel was 2 feet 6 inches, and bore ·705″. The bullet was spherical; before being rammed home it was wrapped in a greased patch, there being a cavity in the butt for carrying these patches. After firing a few rounds the barrel became so foul that it was difficult to ram the bullets home; a wooden mallet was therefore served out with each rifle to drive the ball down the barrel. This rifle remained in the British service till about the year 1835, when it was superseded by 'the Brunswick rifle,' the invention of Major Berner in the Brunswick army. The barrel of this arm was rifled with only two grooves having one turn in the length of the barrel; the bullet, which was spherical, was 'belted'—the belt fitting into the grooves in the barrel—this method being adopted to give the bullet a spin. A grease patch was also used with this rifle; it added greatly to the difficulty of loading, as it made it extremely difficult to see whether the belt on the bullet was properly placed in the grooves or not. This rifle was the first arm in the British service which had a percussion-lock, and it was not till the year 1842 that a percussion musket was generally adopted for the service. A rifle of a similar design was about the same time adopted in Russia and in some of the German principalities.

In 1837 a rifled arm was adopted in France for the use of the 'Chasseurs' or rifle regiments. This arm was rifled in the chamber on a system invented by Captain Delvigne of the French army. The diameter of the chamber was slightly smaller than the calibre of the bore; the ball was driven into the rifling, but not sufficiently far to crush the powder. In 1841 the Prussians discarded their old muzzle-loading smooth-bore musket, and introduced in its stead an arm which, besides having a rifled barrel, was also made to load at the breech, and in a few years the whole Prussian army was armed with the celebrated 'Zündnadelgewehr' or needle-gun. This arm, the invention of Dreyse (q.v.), is a bolt-gun, the needle being contained in the bolt; to load, give a smart blow to the handle of the bolt to release it from its fastening, then draw back the bolt and insert the cartridge, close the bolt and lock it by turning the handle down to the right. The act of closing the bolt compresses the mainspring and holds back the needle, which is released in the usual way on pulling the trigger. The cartridge is a peculiar one. There is a papier-maché plug called 'Zündspiegel,' in which is imbedded the bullet in the form of an egg. The percussion-cap is fixed in the rear of the plug; behind the plug is the powder charge. The powder, the plug, and the bullet are all enclosed in a paper cartridge-case, which is tied in front of the bullet. On firing the gun the needle presses through the powder charge and strikes the cap in the plug so that the charge is ignited from the front, the idea being that by this means the bullet is less likely to be detached from its bed in the papier-maché plug, which latter takes the rifling and imparts rotation to the projectile, the diameter of which is ·54 of an inch, whereas the calibre of the barrel is ·61 of an inch.

During some experiments at Spandau in 1846 so many needles were broken that the continuance of the arm in the service was in great jeopardy; but its efficacy in quelling disturbances in the troublous times in 1848 and 1849 was so great that in the year 1850 a further large number of arms was made, and the system was further extended by the introduction of carbines on the same model. In 1842 the Austrians armed their rifle regiments with a rifle. Thus we see that by the year 1842 all the great powers of Europe had armed a part of their troops with rifles, and that by 1846 the whole of the Prussian army was not only so armed, but that their arms also possessed the great superiority over all others of being breech-loaders. Another point in which the Prussians had a superiority over other nations was that they had a complete cartridge combining in one case the projectile, the powder charge, and the percussion-cap—the introduction of a breech-loader enabling them to have a capped cartridge instead of having to place a cap on the nipple for each discharge. Those who are old enough to remember the old percussion-lock with the capping and uncapping of the nipple will appreciate the immense advantage that was gained by the introduction of a capped cartridge.

The vast superiority of the Prussian needle-gun over the rifles in use in other countries gave a great impetus to the spirit of invention, and in 1849 Captain Minié (q.v.), of the French army, brought out a rifle called the Minié rifle; this arm was first introduced into the French, and subsequently, about 1851, into the English army. Up to this date rifles were only issued to rifle regiments, but with the introduction of the Minié rifle it was intended to discard the smooth-bore altogether and to arm the whole army with rifles. The adoption of the Minié rifle was a great step in advance; it was the first time the spherical bullet was discarded in favour of one of a cylindro-conoidal form. The bullet had a hollow base in which was placed an iron cup; on the explosion of the powder this cup forced the bullet into the grooves

of the rifling. The separate grease patch was discontinued, lubrication being obtained by greasing the paper in which the bullet was wrapped with a mixture of tallow and beeswax. The rifle weighed 9 lb. 13 oz.; its length was 4 feet 7 inches. The barrel weighed 4 lb. 13¼ oz. and was 39 inches long; the diameter of the bore was ·702″, the number of grooves three, having a twist of one turn in 36 inches. The charge of powder was 2½ drams, or nearly 70 grains, and the weight of the bullet was 680 grains. The rifle was sighted to 1000 yards. A description of it has been given in some detail for the sake of comparison with the rifles of the present day. All the English infantry regiments which proceeded to the Crimea were armed in the first instance with this rifle, and a large proportion of the French army also had a rifle constructed on the same principle, though varying in detail from the English pattern. This gave the allies an immense advantage over their Russian adversaries, who were still, with few exceptions, armed with the old smooth-bore.

But the Minié rifle was cumbersome and heavy, and as early as 1852 experiments were made with a view of obtaining a better weapon. The result of these experiments led to the introduction of the Enfield Rifle, Pattern 1853, so called from the Royal Small-arms Factory at Enfield Lock, from which factory the rifle was first introduced. The principal point of difference between this arm and the Minié was the great reduction in the diameter of the bore from ·702″ to ·577″. This reduction of the bore enabled the barrel to be made very much lighter without in any way impairing the arm as a shooting weapon; in fact it shot very much better, as the bullet was better proportioned. And, while the powder charge remained the same, the bullet was reduced in weight from 680 to 535 grains; by this means the initial velocity was greatly increased and the height of trajectory diminished at all ranges. The lubrication of the bullet was the same as in the Minié. There were two descriptions of this rifle, the long and the short; the long was issued to the regiments of the line, and the short to rifle and light infantry regiments. A carbine was also constructed on the same principle for issue to the cavalry and Royal Artillery. The issue of this rifle and ammunition to the native troops in India was the occasion of the Indian Mutiny of 1857, it being believed that the grease round the bullets was cows' and pigs' fat purposely supplied to defile Hindus and Mohammedans alike.

But while the armies of Europe, with the exception of the Prussian, were all armed with a muzzle-loading rifle more or less on the principle of the Minié, experiments were being continually carried on with the view of obtaining a good breech-loader. It was not, however, till the Danish war of 1864 that the very vast superiority of the breech- over the muzzle-loader was brought prominently home to the authorities. The need was urgent, but in order to give time to discover a really satisfactory breech-loading rifle it was determined in the first instance to convert the Enfield into a breech-loader by attaching the Snider breech-action to the Enfield barrel. The old arms were readily converted, and a large number of new arms were made on this principle, so that by the time of the Franco-Prussian war the whole English army was armed with the Snider breech-loader, and during the winter of 1871–72 the militia and volunteers also received these arms; but it was perfectly well understood that the introduction of the Snider breech-loader was only intended to fill the gap until a more perfect and more efficient weapon could be devised; and after a most exhaustive series of trials, which had been conducted for some time by a special committee appointed for the purpose, the Martini-Henry rifle was in the year 1871 recommended for adoption in the English army.

The manufacture commenced shortly afterwards, and the first issue of rifles of this pattern to the troops was made in 1874. The Martini breech-action has already been described under the head of Breech-loading (q.v.). The barrel was the invention of Mr Alexander Henry, a gunmaker of Edinburgh. The calibre is ·45″, and the form of the rifling is peculiar. Fig. 1 represents an end section of a barrel rifled on this system. There

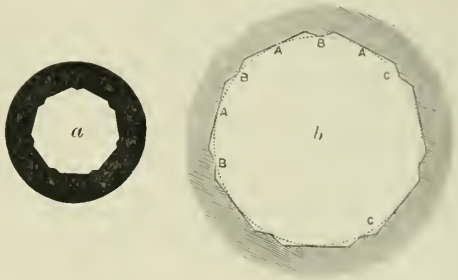

Fig. 1.—Section of Henry Barrel, actual size (*a*) and enlarged (*b*).

are seven grooves, having a complete turn in 22 inches, cut in the barrel, forming seven plain surfaces at AA. These are tangential to the periphery of the projectile which is represented by the dotted circle C. In addition to the bearing surfaces thus obtained there are seven angular projections, BB, extending inwards from the ends of the grooves on plain A. Thus in its passage down the bore the bullet has fourteen bearing surfaces at AA...BB, and it expands into the spaces left between A and B, and thus obtains its rotatory motion. Whilst these transformations were going on in England the French had adopted the Chassepôt rifle in 1869, superseded in 1874 by the Gras; the Germans in 1871 discarded the needle-gun and adopted the Mauser (see BREECH-LOADING); the Austrians after their war with Prussia in 1866 adopted in 1868 the Werndl rifle; the Italians adopted the Vetterli in 1871; the Russians adopted the Berdan rifle, Mark I., in 1867, superseded in 1871 by Mark II. of the same rifle; the Americans adopted the Springfield, whilst the minor states adopted breech-loaders of various designs and patterns. It is unnecessary in this article to give a full description of all these rifles, most of them having the bolt breech-action, a drawing of which may be seen under the head of Breech-loading (q.v.), and the tables at the end of the article give all essential particulars in connection with the more important arms.

At the time of its introduction the Martini-Henry rifle was probably the finest military rifle in Europe; it is extremely accurate either at long or short ranges; its bullet has great penetrative power. The rifle is simple and does not easily get out of order. But, while the Martini-Henry rifle was more accurate at all ranges and had a higher terminal velocity and lower trajectories at long ranges than the rifles of the continental armies, these rifles had a higher muzzle velocity and lower trajectory up to ranges of 500 yards. This was due to two causes: first, because the proportion of powder to bullet was greater in the foreign than in the English cartridge; and secondly, because the value of $\frac{D^2}{W}$ was also greater—this being the

mathematical expression used in England to denote the power of the air to retard bullets in their flight, where D is the diameter of the bullet in inches and W its weight in pounds; therefore the smaller the value of the fraction the less power has the air to retard the flight of the bullet, and *vice versâ*. The heavier the bullet can be made in proportion to its diameter, the better able it will be to maintain its velocity at long ranges. It was determined to endeavour to remedy the defect referred to above, so that the English rifle should be superior to all others in all particulars at all ranges. To do this it was necessary to maintain the low value of $\frac{D^2}{W}$ and to increase the proportion of powder to bullet; this led to the introduction of the Enfield-Martini rifle, in which the Martini action was maintained, but the calibre of the barrel was reduced to ·40″. Owing to the high muzzle velocity obtained—viz. 1570 feet—the trajectory was very flat and the shooting exceedingly accurate. Several thousands of these arms were made, but before they were issued to the troops a far more important change was determined on—viz. the introduction of a *magazine* rifle. A magazine rifle may be described as one which has attached to it a magazine or case or hopper containing four or more cartridges which are fed one by one into the barrel by mechanism in connection with and actuated by the breech-action; and the primary object of a magazine arm is to enable the soldier at a critical moment to fire a certain number of consecutive shots without having to reload from the pouch.

The great importance of a magazine arm was first practically demonstrated in the American war between the North and South in 1861, when one regiment of the northern army, armed with a magazine rifle, successfully resisted the attack of a force at least three times as numerous armed with the ordinary single loader, simply on account of the great rapidity of fire. And again in the war between Turkey and Russia in 1877 the constant repulse of the Russian assaults on the Turkish lines before Plevna was in a great measure, if not mainly, due to the fact that the Turks were armed with the Winchester repeating rifle, which enabled them to mow down the Russians by hundreds as they crossed the open to the assault. In the United States there were at that time several systems already in practical use, and after the experience of the Turkish war the question was seriously taken up by most of the European governments. By the end of the year 1879 the French government had adopted the Kropatschek magazine rifle for the navy; the Germans were experimenting with a Mauser rifle converted to take the Lee magazine; the Austrians were experimenting with the Kropatschek and the Spitalski; in Italy the Bertoldo rifle had been issued to some few regiments for trial; in Switzerland the troops were armed with the Vetterli repeater; and in Norway and Sweden a repeater on the German principle was on trial. The matter was then taken up by the English government, and a committee was appointed by the War Office to consider the whole question. Although the number of magazine rifles is legion, the magazines themselves are all modifications of one or other of a few principal systems or types, which may for convenience be divided under the following heads:

(1) Those with the magazine in the fore end of the stock under the barrel; (2) those with the magazine under the breech-action; (3) those with the magazine above and at the side of the breech-action; (4) those with the magazine in the butt of the stock; (5) those with the magazine in a circular form round the breech-action.

Type No. 1 may be described briefly as follows: The magazine consists of a metal tube fixed in the fore end of the stock, and capable of containing eight or more cartridges. The tube or magazine is loaded by drawing back the bolt of the breech-action and inserting the cartridges one by one into the tube at the breech end, there being a catch to retain them when once inserted; the insertion of the cartridges gradually compresses a long spiral spring contained in the tube, so that when the tube is full the spring is completely compressed, and is exerting its force on the whole column of cartridges in the direction of the breech end of the barrel, the base of one cartridge being always pressed against the bullet of the one next behind it. The action of unlocking and drawing back the bolt withdraws one cartridge at a time from the magazine, and places it in front of the bolt; and the action of closing the bolt forces the cartridge into the barrel. As each cartridge is thus withdrawn for loading, the column of cartridges within the tube is pressed back as already described, leaving another cartridge in position to be withdrawn for loading. There is generally a stop or 'cut-off' which, when applied, prevents the bolt from acting on the magazine, so that the arm may be used as a single loader on occasions when it may not be considered either necessary or desirable to bring the magazine into play.

In type No. 2 the magazine can either be detachable and carried in the soldier's pouch, to be attached to the rifle when required for use, or it can be a fixture on the arm itself. In either case the magazine consists of a metal box containing from six to ten cartridges, according to the size of the cartridge. The cartridges, which are inserted at the top of the box or magazine, compress a spring in the magazine which is generally either in a zigzag form or in the form of a C. In this type of magazine the cartridges lie on the top of one another, and not bullet to base as described in No. 1 type. They are held in the magazine by a catch or 'cut-off,' and when this is applied the rifle can be used as a single loader. On withdrawing the cut-off and drawing back the bolt, the spring in the magazine forces one cartridge up in front of the bolt, which, on being pushed home, forces the cartridge into the barrel. By a mechanical contrivance, only one cartridge at a time can be forced up out of the magazine.

In type No. 3 the magazine can also be either detachable or a fixture on the rifle. In magazines of this type no spring is necessary to force the cartridge out of the magazine, which is loaded by dropping the cartridge in at the top. At the bottom of the magazine, on the side next the body of the rifle, there is a slot, with a corresponding slot in the body or shoe of the breech-action. On drawing back the bolt one cartridge passes out of the magazine through these slots into the shoe, and just in front of the bolt, by the force of gravitation alone. The cartridge is then forced into the barrel by the action of closing the bolt. There is also a cut-off with magazines of this type to prevent cartridges passing through the slots when it is not required to use the magazine.

In No. 4 type various attempts have been made from time to time to utilise the butt of the stock by hollowing it out and converting it into a magazine. In this system the cartridges are brought up one by one into the loading position by a ratchet actuated by the bolt. As the bolt is drawn back the ratchet is also forced back, and hooking on to a cartridge brings it forward as the bolt is pushed home again.

In type No. 5 the cartridges are contained in a cylinder placed around the breech-action of the rifle. A spring acts on these cartridges and brings

them up one by one in front of the bolt, the act of closing forcing the cartridge into the barrel. There are objections to the two types Nos. 4 and 5 which have prevented the adoption by any government of a magazine arm constructed on these systems; it is unnecessary therefore to describe them further. Of the arms previously referred to as being under trial by various European governments at the close of the year 1879 the Kropatschek is an example of type No. 1, the Lee magazine of type No. 2, the Jarmann of type No. 3. There is no example of type No. 4, but the Spitalski is an example of type No. 5.

The Germans were the first to re-arm the whole of their infantry with a magazine rifle; but, pending the result of trials which were being carried on with small-bore rifles and smokeless powder, they determined in the first instance to convert the then existing Mauser rifle into a magazine arm, as this would require no change of ammunition, the magazine being placed in the fore end of the stock as described under the head of No. 1 type. But it was generally understood that in order to derive the full benefit from a magazine arm the soldier would have to carry more ammunition, and, as it was not desirable to add to the weight of his equipment, this could only be done by reducing the weight of the cartridge.

A reduction of bore, therefore, became almost a *sine quâ non*, as by that means only could a sensible reduction be made in the weight of the bullet, and with it of the cartridge. But this led to fresh difficulties. It is quite impossible in the space available for this article to discuss fully all the difficulties which had to be overcome either as regards cartridge-case, bullet, powder, rifling, &c., but it may be stated that it was generally conceded that the ordinary charge of loose black powder could not be used in a rifle with a bore less than ·40″ on account of the difficulty of overcoming the fouling which would take place in a small bore, and also on account of the difficulty of making a suitable cartridge-case. Therefore the question of the explosive to be used had to be considered in connection with the question of the reduction of bore. The Swiss were the first to arrive at a practical solution of the difficulty. Two rifles were brought out in Switzerland very similar to one another, and merely differing in points of minor details. One was the Rubin rifle, having a calibre of ·295 inch. The powder charge consisted of 70 grains of black powder compressed into a solid pellet, and the weight of the bullet, which was nickel coated, was 217 grains. The force of the powder was very greatly increased by compression, and, the proportion of powder to bullet being very high, a muzzle velocity was obtained of no less than about 1850 feet; and the value of $\frac{D^2}{W}$ being 2·8 the velocity was well kept up at all ranges. The other Swiss rifle was the Hebler. The calibre of this rifle was the same as the Rubin—viz. ·295 inch; the charge was 74 grains of compressed black powder, the weight of nickel-plated bullet 225 grains; both these rifles had magazines on the Lee principle.

Experiments were carried on in England with both these rifles, and the results were such as to warrant the committee, which had been investigating the subject, to recommend in the year 1887 the adoption of a magazine rifle for the English army, of which the following is a brief description. The barrel is rifled on the Metford principle (fig. 2, C), in which there are no corners nor angles to hold the fouling. The twist of the rifling is one turn in 10 inches, the bore of the barrel is ·303 inches, and its length 30·20 inches.

The bolt breech-action which has been adopted for the rifle is a modified form of the Lee bolt. The Lee magazine (fig. 2, D, E), as first adopted (Mark I.), holds eight cartridges, and is detachable—i.e. it can be carried on the arm itself or in the soldier's pouch; its position on the arm is immediately in front of the trigger-guard underneath the body of the breech-action, in which a slot or opening is cut through which the cartridges are fed up by a spring ready to be pushed into the barrel by the closing of the bolt. There are two turned-in lips (fig. 2, D) at the mouth of the magazine under which the heads of the cartridges are inserted when filling it; the rim of the cartridge projecting sufficiently to be caught by the bolt. These lips prevent the cartridges from being shot out by the spring, and hold the head down till the bullet has entered the chamber of the barrel. A cut-off is provided to enable the arm to be used as a single loader; this is a plate pivoted at one end, and it is pulled out by means of a thumb-piece projecting on the right side. When it is thus pulled out the magazine is in action, but when pushed in the plate partly covers up the aperture through which the cartridges pass out of the magazine, and forms a bed on which to place the cartridges by hand. The magazine, which fits into a slot cut in the stock under the opening in the body, is held in position by a catch. This can be withdrawn by a small trigger in front of the main trigger, when the magazine is released. The magazine can only be filled by one cartridge at a time; these can be passed into it through the slot in the body of the breech if it is desired to fill the magazine when attached to the rifle. The spring (fig. 2, F) which forces the cartridge up is in the form of a coil flattened at the side. The rifle has two sets of sights, the ordinary back sight (fig. 2, A*a*) being graduated to 1900 yards; but for longer ranges there is a pair of sights consisting of a dial sight (fig. 2, B*b*) on the left side of the fore end of the stock, and a short arm (fig. 2, B*c*) near the trigger, at the end of which is a small hole. The weight of the rifle is 9 lb. 6 oz., and length 49·5 inches. The

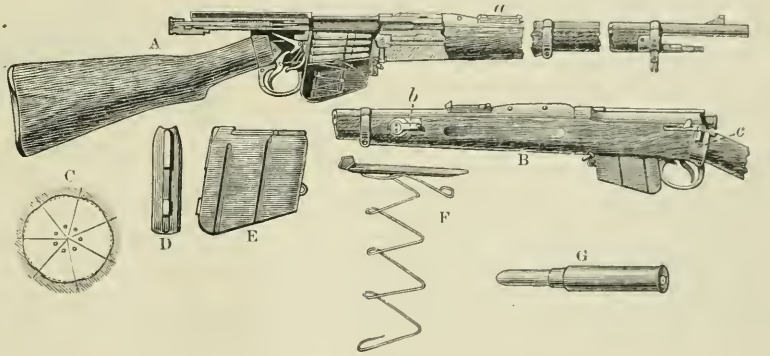

Fig. 2.—The Lee-Metford Magazine Rifle, Mark I.:

bayonet, weighing 15 oz., is in the form of a short knife having a blade 12 inches long. The cartridge (fig. 2, G) for this rifle consists of a solid drawn brass cartridge-case, in which is inserted a pellet of 70 grains of compressed black fine-grain powder. After insertion of the powder pellet the case is necked so as to reduce the diameter at the mouth of the case to ·312 inches. The latest pattern of Lee-Metford rifle (Mark II.), issued in 1898, has various modifications, the principal being that the magazine holds ten cartridges instead of eight, and black powder is superseded by cordite.

The smallness of the bore necessitated a long bullet, in order to get the necessary weight, and a quick twist in the rifling; it was found that an ordinary hardened lead bullet could not stand the strain, and therefore the bullet, which weighs 215 grains, is composed of a hardened lead core inserted into an envelope of cupro-nickel turned over at the end to prevent the gas on the explosion of the pellet getting up between the envelope and lead core. The length of the bullet is 3·05 inches, and diameter ·312 inches. It is pressed into the mouth of the cartridge-case, which holds it firmly. A packet of ten of these cartridges weighs 10 ounces. The muzzle velocity obtained with the powder pellets is 1830 ft.-seconds; but with the cordite powder about 2000 ft.-seconds. When firing at 500 yards range the highest point of the trajectory above the line of sight is 5 feet, whereas that of the Enfield-Martini ·40-bore rifle is 6 feet, and of the Martini-Henry ·45-bore rifle 8 feet 7 inches.

But the English government was not the first to adopt a small-bore magazine rifle for the general armament of the whole army, the French having adopted the Lebel rifle as early as the year 1887. It has been already stated that the French navy had for some time previously been armed with the Kropatschek repeating rifle, having the magazine in the fore end of the stock; and, like the Germans, the French had converted their single loading Gras rifle into a repeater on the Kropatschek model. The Lebel is an improved Gras repeating rifle; the bore of the barrel is ·315 inches. The magazine (fig. 3) is in the fore end of the stock, and

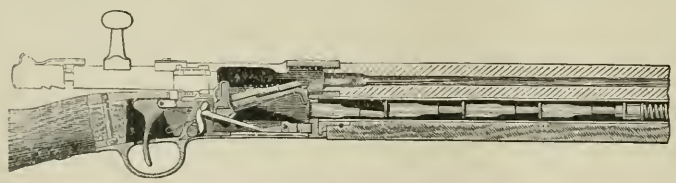

Fig. 3.—French Lebel Magazine Rifle, in section.

holds eight cartridges. The points of the bullets are flattened to lessen the chance of accidental explosions in the tube, which might be caused by the cap of one cartridge resting on the point of the bullet of the cartridge in rear of it. The cartridge-case is charged with about 35 grains of smokeless powder, and the bullet weighs about 215 grains. The muzzle velocity is about 2000 ft.-seconds. Great results were expected from this rifle when first introduced; but experience has shown that the smokeless powder adopted for the Lebel cartridge is not reliable, and that after being kept a year or so it greatly deteriorated.

The Lebel rifle itself has proved inferior to one of a simpler construction, called the Berthier rifle after the name of the inventor. The breech mechanism is on the same principle as that of all other magazine arms—viz. the bolt containing the striking apparatus; but the magazine in the fore end of the stock is discarded, and the Mannlicher magazine adopted in its place. This consists of a light metal frame or clip holding five cartridges; the clip is dropped into a receptacle to hold it, but cannot drop through, as the bottom cartridge rests on a spring which forces the cartridges up, as in the case of the Lee magazine, and the clip is held up by the top cartridge, which presses against the turned-in sides of the clip. As soon as the last cartridge is fed into the barrel by the bolt there is nothing to hold up the clip, which then drops out, and on the withdrawal of the bolt another clip full of cartridges is inserted. There is a cut-off which enables the rifle to be used as a single loader. The bullet weighs 205 grains, and consists of a hardened lead core coated with a white metal envelope. The charge is 33 grains of smokeless powder. Ten cartridges weigh about 8¾ oz. The bore of the barrel is ·301″, and weight of arm 8½ lb. The muzzle velocity is 2070 ft.-seconds. The extreme simplicity in the mechanism of the bolt of this rifle is one of its chief recommendations. In Germany the original Mauser rifle, which had been converted into a magazine arm as a temporary measure, as already described, was, in 1889, superseded by one, also the invention of Mauser, having a barrel with a bore of ·315 inches, and in which the magazine is filled from a metal clip containing five cartridges,

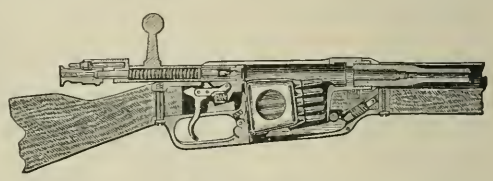

Fig. 4.—German Mauser Magazine Rifle, in section.

somewhat like the Mannlicher; but the clip or cartridge-holder does not itself pass into the receptacle made for the cartridges, as in the Mannlicher; but, being held over the receptacle or magazine, the cartridges are pushed out of it by the thumb, and the clip itself falls off. The magazine rifles of other nations are all modifications of one or other of those already described; but there is a peculiarity in the construction of the Mauser and Mannlicher rifles which must be mentioned. This peculiarity consists in the barrel proper being encased in a barrel jacket or light steel cylinder, both being screwed into the body of the breech, and the nose end of the barrel passing loosely through a thimble at the end of the barrel jacket. The sights are fixed to the barrel jacket. There is a very slight air-space between the barrel and the jacket, and the advantages claimed for the compound barrel are chiefly that the barrel proper is protected and is less liable to injury from a blow, and that the outer coating does not heat so rapidly as a barrel constructed in the ordinary way, and that therefore a handguard, such as is used with the English rifle, is not necessary. The Mannlicher and the Mauser both have a calibre of ·315″, and fire a bullet weighing 216 grains, the charge of smokeless powder being about 35 grains, and the muzzle velocity about 2000 ft.-seconds. The value of the Mauser in capable hands was well demonstrated throughout the South African war of 1899–1901.

Sporting Rifles have already been dealt with under the head of Breech-loading and Firearms (q.v.). But it may be as well to observe that the same principle or law governs the ammunition for the sporting as for the military rifle, only it is differently applied. In the military rifle a high

velocity and great accuracy are required at moderately long ranges; it is therefore necessary to have a heavy bullet in proportion to its diameter. But in sporting rifles long range shooting is not required; the bullet can therefore be made very much lighter in proportion to its diameter. And as the shock of recoil from a light bullet is comparatively slight, the powder charge may be very large; by this means a very high muzzle velocity is obtained and great accuracy at short ranges. As an example of the above we may take the ·450″ bore Express rifle and compare it with the Martini rifle having the same bore. The charge of powder for the Martini-Henry cartridge is 85 grains, and weight of bullet 480 grains—proportion of powder to bullet, 1 to $5\frac{2}{3}$; muzzle velocity, 1320 ft.-seconds; highest point of trajectory at 100 yards, $2\frac{3}{4}$ inches; at 150 yards, nearly 7 inches. In the ·450″ Express the powder charge is 120 grains; weight of bullet, 260 grains; proportion of powder to bullet, 1 to $2\frac{1}{6}$; muzzle velocity, over 2000 ft.-seconds; highest point of trajectory at 100 yards, $1\frac{1}{3}$ inch; at 150 yards, under $3\frac{1}{4}$ inches. In the year 1891 the troops of the countries enumerated below were either armed or were in process of being armed with magazine rifles; but at that time in Norway and Sweden and in Russia the pattern to be adopted had not been finally decided on. In the United States of America the original Lee rifle is still in use, but the Winchester and other small-bore repeaters are also in the hands of a part of the United States army.

For a more detailed account of the arms referred to in above article the reader is referred to 'Armes à feu portatives,' by Schmidt, in *Engineering*, Nos. of February 6, March 6, April 3, and May 15, 1891, and *Treatise on Military Small-arms and Ammunition*, by Lieut.-colonel Bond, R.A. See also the articles in this work on FIREARMS, GUN, GUNNERY, PROJECTILE, VOLUNTEERS, &c.

Riflemen. All British infantry are now riflemen; but till 1854 riflemen were the exception, the army generally having the smooth-bore 'Brown Bess.' During the Peninsular war the 60th and 95th Regiments were armed as riflemen, taught light infantry drill, and clothed in dark green. The 95th became the 'Rifle Brigade.' The 60th are called 'The King's Royal Rifle Corps.' In 1881 the 26th and 90th were linked to form the 'Scottish Rifles,' and dressed in green; while the 83d and 86th Foot were formed into the 'Royal Irish Rifles.' See also VOLUNTEERS.

Riga, capital of Livonia, and next after St Petersburg and Odessa the third seaport of Russia, lies on the Dwina (crossed here by a bridge of boats and a railway bridge) 7 miles from the mouth of the river, and 350 by rail SW. of St Petersburg *viâ* Pskoff. The old town has narrow streets and mediæval houses and stores; but the suburbs are laid out in broad streets with handsome buildings. The chief edifices are the cathedral built in 1204, burned down in 1547, but rebuilt; St Peter's Church (1406), with a steeple 460 feet high; the castle of the old Knights of the Sword, built 1494-1515, the former residence of the grand-master of the order; and several old guild houses and Hanseatic halls. It is the seat of an archbishop of the Greek Church. Its industries are rapidly growing; they turn out cottons, machines, tobacco, corks, spirits, oil, metal wares, glass, paper, flax, jute, and oilcloth, and employ nearly 12,000 work-people. The exports reach an annual average of £5,560,000 (£2,396,000 in 1866), and embrace grain (average £1,433,000), timber (£1,175,000), flax (£1,077,000), linseed (£581,500), hemp and hemp-seed (£443,000), wool, hides, eggs, oilcake, hair (horse and camel), and mineral oil. The imports (iron and steel, coal, machinery, cotton, dye-woods, corkwood, herrings, manure, woollens, and wine) average £2,233,000 (£675,000 in 1866). Britain's share in this trade is represented by an average of £2,604,000 for exports and £978,350 for imports. The port, which is closed by ice for three to four months in the winter, is entered by an average of 2396 vessels of 1,047,915 tons every year, of which 625 of 464,500 tons are British. Riga has grown from 102,590 inhabitants in 1867 to 169,329 in 1881, and 181,935 in 1891. Nearly one-half are Germans (with German-speaking Jews), one-fourth Russians, and one-fourth Letts. Riga was founded in 1201 by Albert, Bishop of Livonia, and soon became a first-rate commercial town, and member of the Hanseatic League. It belonged to Poland from 1561, and in 1621 was taken by Gustavus Adolphus, and in 1710 was finally annexed to Russia.

The GULF OF RIGA is an inlet on the east side of the Baltic Sea, which washes the shores of Courland, Livonia, and Esthonia. It is 105 miles in length from north to south, and about 60 in breadth. The islands of Oesel, Dagö, Mohn, and Worms lie athwart the entrance. The chief river which falls into the gulf is the Dwina. Sandbanks render navigation in some parts dangerous.

Righi. See RIGI.

Right Ascension. See ASCENSION.

Right-handedness is no doubt due to the lack of perfect symmetry in the human body. If the latter could be folded over from a medial line so that each organ of the one side fell exactly upon a corresponding organ of the other, we should have a structure highly favourable, mechanically, to the equal use of each limb, and ambidextral individuals would be the rule, not the exception. If a vertical line be drawn dividing the body it will be found that the centre of gravity is a little to the right of this medial line. This makes the right side heavier. From a series of experiments the greater weight has been estimated at about 15 ounces. Upon this fact is founded the mechanical theory of right-handedness, or the predominance of the right hand over the left; or, more generally, of the limbs of the right side over those of the left, as expounded by Professor Buchanan of Glasgow in a pamphlet published in 1862. The three-lobed right lung is more capacious and receives more air during an inspiration than the two-lobed left. The liver during inspiration swings toward the right side, shifting the centre of gravity farther to that side. In violent muscular exertion there is more air proportionally inhaled by the lung of the side which sustains the exertion. Normally about 230 cubic inches of air are contained by the lungs, of which the right holds 20 inches more than the left. Under exertion of the right side the larger lung is better filled than the smaller, and the centre of gravity is removed until it is found in a line passing through the right foot; so that the right leg and foot afford a steadier basis of support than the left would do under similar circumstances. Whichever leg we stand on we use the arm of that side to greater advantage, and thus, through the greater use of the right lower limb, the right upper limb comes to be preferred.

Professor Buchanan's theory also explains the almost universal habit of carrying burdens on the left shoulder. In the case of a light weight, slung on the arm, the equilibrium of the body is better

maintained by carrying it on the left side. If the weight be a heavy one, borne on the left shoulder, the burden is really being supported very much by the right limb, owing to the natural curve of the body towards the right side, while sustaining the pressure.

But, it may be argued, if this theory covers the case, then left-handedness, which is certainly inherited, cannot be accounted for except on the extraordinary supposition of transference of the viscera. In a very few cases left-handedness has been found to accompany such transposition. Strange to say the liver has been found on the left side, and the heart, stomach, and spleen on the right without any derangement to the health of the subject, even from the point of view of a life-insurance company. Nevertheless, the number of cases of genuine left-handedness far exceeds such instances of transposition. An explanation of left-handedness in normal structures has been sought by falling back on the fact that the cerebral hemispheres of the brain work the muscles cross-wise. Ferrier's researches have proved that when we see with the right eye we see with the left side of the brain. Another curious and instructive fact is that, although an animal be rendered blind of an eye by the destruction of a convolution on one side of the brain, the blindness is temporary. Soon the other hemisphere can take up the function, and then vision is possible with *both* eyes as before.

Viewed in this light, hereditary left-handedness may be due to the greater development of the right side of the brain. Suppose accident, or the cruelty of the conqueror, had deprived a comparatively young archer of his right hand or right eye (and the latter cruel custom is referred to in the Bible), then the left hand, governed by the right hemisphere, being called into work would react on that hemisphere, whose blood-vessels would be oftener replenished and whose strength and sensitiveness would grow. It is not too much to assume that in some cases this improved power of the right hemisphere might be transmitted to a descendant. 'It is practically certain,' says Dr Bastian, 'that the great preponderance of right-handed movements in ordinary individuals must tend to produce a more complex organisation of the left than the right hemisphere.' M. Broca states that in forty brains he examined he found the left frontal lobe heavier than the right. These investigations have not yet been thoroughly carried out; but possibly the explanation of obstinate left-handedness lies in that direction.

In connection with the evolution of the species right-handedness, in all probability, has been a late acquisition. The body is more symmetrical in early youth and is more symmetrical in the female than in the male. A very young child betrays no disposition to use the right hand more than the left. The habit of using the right hand gradually increases with boyhood, and boys have to the last a wider range with the right hand than girls, who are proverbially bad stone-throwers. Hitherto, however, the oldest records of the human race, even when man sketched with a flint point on the bones of extinct animals, prove him to have been a right-handed being. His profiles are then sketched with faces toward the left, just as a street arab chalks them on a door at the present day. Nevertheless, the primeval left-handed artist often betrays himself. Bronze weapons are the weapons of right-handed individuals; witness the curious yew-tree handle of a bronze sickle fished up from the lake of Brienne, Switzerland, quite intact and ingeniously carved, 'as incapable,' says Sir Daniel Wilson, 'of being used by a left-handed shearer as our present mower's scythe.'

A few observers of the habits of savages have remarked that left-handed individuals were proportionally more numerous among them. This is what we should expect from the enormous additional demands made by civilisation, its manners, and its tools upon the activity of the right hand. It only requires to spend an hour at a carpenter's bench to see how planes, screws, &c. are fashioned to suit that member. In drawing a pattern of small repeating character we begin, as we begin to write a page, at the top left-hand side, so as to avoid placing fingers on the still undried pigments. Military drill, associated labour, and, as much as any, the tyrant fashion, all urge on the right hand in the path of greater dexterity, leaving the left as the inept drudge whose duty it is merely to assist. No wonder the right has acquired strength, size, greater tactile sensibility, and greater patience of the extremes of heat and cold. Naturalists, who observe that adult monkeys catch nuts more with the right hand, that the African elephant digs more with the right tusk, or that the Carolina parrot has a preferential claw for grasping, tell us that these habits are subject to more numerous exceptions than the exception of left-handedness with human beings. Egyptian and Assyrian painting and sculpture and Etruscan bronzes also elucidate the general law that burdens have been assigned to the left shoulder; so that the position of the shepherd's plaid is nowise a whim, but has its roots in the far past. The primitive blanket-like toga of the Etruscans covers the left shoulder, and is wrapped under the right armpit to allow of the freer motion of that arm.

Use and disuse, by strengthening or weakening organs, would warrant us in believing that where there is inequality of vision between one's eyes the balance would be thrown in favour of the right. As Sir John Herschell has remarked, cases can be adduced of persons who were unaware of one of their eyes being weak almost to blindness until far advanced in life. The writer has a near-sighted left eye, inherited from a grandfather short-sighted in both, the defect of which he did not discover until far advanced in manhood. It is well to know that such disparity in power of vision can be greatly mitigated by the lenses of the oculist. A good deal of folklore is to be found connected with the right and left hands. The rule of the road and the interpretation of omens tell, by the contrary rule obtaining in nations of different race, no small part of their story as to whether they belong to the conquerors or the conquered. See Sir Daniel Wilson's *The Right Hand: Left-handedness* (1891); Professor Dwight in *Scribner's Magazine* (April 1891); also the article BRAIN, Vol. II. pp. 391, 392.

Right, CLAIM OF. See FREE CHURCH.

Right of Way, the right which the public has to the free passage over roads or tracks. The expression is more generally applied to those public routes which are *not* statutory roads, such as hill or field paths, drove roads, bridle and other paths, and cart or driving roads in the common use of the public, which are not kept up by the county authorities. In many instances these roads are the only means of communication between important districts; and generally they are the shorter, and often the more picturesque, ways from one point to another. Right of way also exists along the seashore and on the banks of tidal rivers. The law of rights of way is judicial and not statutory. In Scotland, where of late the chief *causes célèbres* have originated, forty years' continuous use by the public of such roads or paths is the prescriptive period for constituting a right of way; while in England the public acquire a right of way under dedication to them by the owner of the soil, and user signifying their acceptance of the same, or when dedication can fairly be assumed from

notorious user, which needs generally to be proved for a lengthened period, but which may yet, according to circumstances, be presumed from a period of user of only a few years. The following points fall under the legal aspect of a public right of way, according to the law of Scotland: (1) The path or road must go from one public place to another public place. By this is not meant that it must go from one town or village to another; it may be between any two points at which the public have a right to be, and to which they resort for some definite and intelligible purpose. Thus it may run from one highway to another; but it cannot run between a public road and a private house. (2) It must be along some tolerably well-defined route between the *termini*. (3) If there is a definite road between two public places it does not matter for what purpose it is used. It is not necessary that the public should use the road for any business purpose; it is quite sufficient if the purpose is merely for recreation, the exercise of walking, or the contemplation of the beauties of nature. (4) Its use must be maintained by the public themselves in order to keep up the right to the way. Continuous use is necessary, though the public need not use the road every day or every month; yet the right is in danger if use is discontinued for any length of time. But if the public allow themselves to be excluded from the road for seven years the proprietor becomes entitled to continue the exclusion by interdict without raising the question of public right—that is to say, possession for seven years throws the *onus probandi* on the public. According to the law of England such points are not construed in a narrow sense, and they distinctly differ in the following respects: (1) It is not necessary that the right of way be between two public places, and (2) continuous use is not necessary, for no lapse of time as regards user or the claiming of their rights can bar the right of the public to a footpath or a highway once dedicated to them, or where dedication can be assumed. There are, however, statutory provisions for shutting up a road when it becomes unnecessary. The whole breadth of the originally dedicated road, including what is known as 'road wastes,' must always remain as the right of way to the public, and cannot be encroached upon. See TRESPASS.

In Scotland there is no public authority for the protection of the interests of the public in rights of way, or for their maintenance. They are in the position of being left to chance; and 'what is everybody's business is nobody's business' has resulted in many valuable rights being lost. The public, or individual members of the public, have to incur the costs and risks of litigation in the courts under an action of declarator to recover a road which a proprietor has closed, and it is difficult for them to do this. In England, though there is also no direct public authority for the guardianship of rights of way, yet their *maintenance* is so far provided for under section 10 of the Local Government (England) Act, 1888, which enacts that county councils 'may, if they think fit, contribute towards the costs of the maintenance, repair, enlargement, and improvement of any highway or public footpath in the county, although the same is not a main road.'

Both in Scotland and England influential societies exist for the purpose of assisting in the protection of public rights of way—viz. the Scottish Rights of Way and Recreation Society, Edinburgh, founded in 1844 and reconstituted in 1884, and the National Footpath Preservation Society, London, founded in 1884. There are also several societies for special districts. Bills have since 1888 been introduced into the House of Commons by private members with the object of charging a public authority with the duty of protecting and maintaining rights of way, but no legislative measure has yet been passed. See also the section on the law of highways at ROAD. For right of way on the Norfolk Broads, see Walter Rye, *Fishing, Shooting, and Sailing on the Norfolk Broads* (Norwich, 1891).

Rights, DECLARATION AND BILL OF. The Convention Parliament which called the Prince and Princess of Orange to the throne of England set forth, in a solemn instrument known by the name of the Declaration of Rights, the fundamental principles of the constitution which were to be imposed on William and Mary on their acceptance of the crown. This declaration (February 1689), drawn up by a committee of the Commons, and assented to by the Lords, began by declaring that King James II. had committed certain acts contrary to the laws of the realm, and, having abdicated, had left the throne vacant. The main provisions of the Declaration, and of the Bill of Rights (October 1689) based upon it, were to the effect that the power of suspending and of dispensing with laws by regal authority is illegal; that the commission for creating the late Court of Commissioners for Ecclesiastical Causes, and all commissions and courts of the like nature, are illegal; that the levying of money for the use of the crown by prerogative, without grant of parliament, is illegal; that it is the right of the subjects to petition the king, and all prosecutions for such petitioning are illegal; that the raising or keeping of a standing army in time of peace, except with consent of parliament, is illegal; that Protestant subjects may have arms for their defence; that the election of members of parliament should be free; that freedom of speech in parliament should not be questioned in any place out of parliament; that excessive bail ought not to be required, or excessive fines imposed, or cruel or unusual punishments inflicted; that jurors should be duly impanneled, and that jurors in trials for high-treason should be freeholders; that grants and promises of fines and forfeitures before conviction are illegal; and that for redress of all grievances, and the amendment, strengthening, and preserving of the laws, parliaments ought to be held frequently. The remaining clauses treat of the succession to the crown. See also PETITION OF RIGHT.

Rights of Man, DECLARATION OF THE, a famous statement of the constitution and principles of civil society and government adopted by the French National Assembly in August 1789. In historical importance it may fairly be ranked with the English Bill of Rights and the American Declaration of Independence. It suggested the title for Paine's defence of the French Revolution against Burke (1791–92); which was followed by Mary Wollstonecraft Godwin's *Vindication of the Rights of Women*.

Rigi, or RIGHI, an isolated mountain standing between the Lakes of Lucerne, Zug, and Lowerz, in Switzerland, is greatly frequented by visitors on account of the extensive views it commands of some of the finest Swiss scenery. Verdant pastures clothe the summit, and the slopes are belted with forests. About 100,000 tourists ascend the Rigi (5906 feet) every season, principally by means of two toothed railways—one from Vitznau (1871) on the Lake of Lucerne, the other from Arth (1875) on the Lake of Zug, 4¼ and 7 miles long respectively. There are half-a-dozen hotels near or at the summit, as well as a Capuchin monastery (1689), the church of which contains a wonder-working image of the Madonna that attracts numerous pilgrims.

Rigidity is one of the properties of matter which sharply differentiate solids from fluids. In

abstract dynamics a rigid system is a collocation of particles which, however much they may move as a whole, never alter their mutual relative positions. Such a system has no true physical existence, since there is no known substance which can resist deformation. Nevertheless, those substances which yield but slightly to deforming stresses—all solids practically—are regarded as possessing a certain rigidity, which is measured by the ratio of the deforming stress to the deformation produced. The greater this ratio is, the more nearly does the substance approach the condition of the ideal *rigid* body, whose behaviour under the action of given forces forms the subject-matter of what it is usual to call Rigid Dynamics. The property of rigidity itself, as described above, falls to be discussed under the general subject of elasticity. Of ordinary substances steel possesses the highest rigidity. See ELASTICITY, ETHER, MATTER.

Rigor Mortis. See DEATH.

Rigveda, the first and principal of the four Vedas. See VEDA.

Rilievo. See RELIEF.

Rilo. See RHODOPE.

Rim'ini, a city of Italy, stands on the shore of the Adriatic, 69 miles by rail SE. of Bologna; it is still surrounded with walls, and contains many mediæval buildings. The cathedral, the temple altered and built to commemorate the unhallowed love of Sigismundo Malatesta and Isotta degli Atti, a beautiful Renaissance structure, dates from 1446–50; the church of St Giuliano is adorned with pictures by Veronese, and St Girolamo with a picture of that saint by Guercino. The ancient castle of the Malatesta is now used as a prison. The little river on which the city stands is spanned by a white marble Roman bridge, 236 feet long, with five arches. Beside one of the gates stands the triumphal arch, 46 feet high, erected in honour of Augustus. The spot where Cæsar stood to address his soldiers after crossing the Rubicon (about 10 miles NW. of Rimini) is marked in one of the squares by a monumental pillar. The city manufactures silks and sail-cloth. Pop. 10,838, with suburbs 19,158. One of these suburbs, half a mile distant on the seashore, is much visited for sea-bathing. Originally an Umbrian, and then for several centuries an Etruscan city, Rimini (Ariminum) fell into the hands of the Romans in 286 B.C. They made it the northern terminus of the Flaminian Way from Rome, and the southern terminus of the Æmilian Way to Piacenza and of the Popilian Way to Venice, and utilised the advantages of its position as a seaport for communicating with the east side of the Adriatic. After being battled for by Goths and Byzantines, and held by the latter, the Lombards, and the Franks, it became a shuttlecock between the emperor and the pope. At last, weary of this alternation of masters, neither of whom profited her, Rimini put herself under the protection of the House of Malatesta (1237), whose chiefs soon made themselves absolute masters of her fortunes. Amongst the tragic episodes that marked the family history of these rulers may be mentioned the killing of Francesca (q.v.) da Rimini and her lover by his brother, and the story of Parisina, the subject of Byron's poem. The most famous, or rather infamous, member of the family was Sigismundo (1417–68), a brave and skilful soldier, a scholar, a patron of the fine arts, but a man of brutal animal passions, and with no sense of right and wrong. The head of the house sold his rights over Rimini to the Venetians in 1503; but the pope wrested them to himself in 1528, and kept them until 1860. See Yriarte's *Un Condottiere au XV. Siècle: Rimini* (1882).

Rimouski, a Canadian town, stands on the south shore of the St Lawrence, at the influx of the Rimouski River, 182 miles by rail NE. of Quebec. It is the seat of a bishop, a summer watering-place, and a telegraphing station for arrivals and departures of ships. Pop. 1417.

Rinderpest. See CATTLE-PLAGUE.

Ring (Sax. *ring* or *hring*) is any circle or section of a cylinder. Rings of gold, silver, and of other metals and materials have been worn in all times and countries, and while they have been used to decorate the ears, neck, nose, lips, arms, legs, and toes, finger-rings have always occupied the most important and significant place among such ornaments. From the earliest period of civilised relationships the finger-ring was a convenient means for carrying the signet of its wearer. In Genesis, xxxviii. 17, 18, we read that Judah left his signet as a pledge with his daughter-in-law; and in chap. xli. 42 it is narrated that Pharaoh delivered to Joseph his royal signet as a token of deputed power and authority. From the fact that these ancient rings carried engraved signets early ring-lore is intimately mixed up with the origin and development of gem and seal engraving. Herodotus mentions the wearing of finger-rings by the Babylonians; and from Asia the habit probably passed into Greece, although the Homeric poems mention ear-rings alone. In the later Greek legends the ancient heroes are described as wearing rings, and every freeman throughout Greece seems afterwards to have possessed one. The Lacedæmonians wore iron rings. The Romans are said to have derived the use of rings from the Sabines; their rings were at first, as those of the Greeks, signet-rings, but made of iron. Every free Roman had a right to wear one; and down to the close of the republic the iron ring was worn by those who affected the simplicity of old times. Ambassadors, in the early age of the republic, wore gold rings as a part of their official dress—a custom afterwards extended to senators, chief-magistrates, and in later times to the equites, who were said to enjoy the *jus annuli aurei*, from which other persons were excluded. It became customary for the emperors to confer the *jus annuli aurei* on whom they pleased, and the privilege grew gradually more and more extensive, till Justinian embraced within it all citizens of the empire whether *ingenui* or *libertini*. Rings entered into the groundwork of many oriental superstitions, as in the legend of Solomon's ring, which, among its many magical virtues, enabled the monarch to triumph over all opponents, and daily to transport himself to the celestial spheres, where he learned the secrets of the universe. The Greeks mention various rings endowed with magic power, as that of Gyges, which rendered him invisible when its stone was turned inwards; and in old Saxon romances a similar ring legend is incorporated. The ring of Polycrates (q.v.), which was flung into the sea to propitiate Nemesis, was found by its owner inside a fish; and there were persons who made a lucrative traffic of selling charmed rings, worn for the most part by the lower classes. By many Mussulmans at the present day a ring having enclosed in it a verse from the Koran is worn as an amulet.

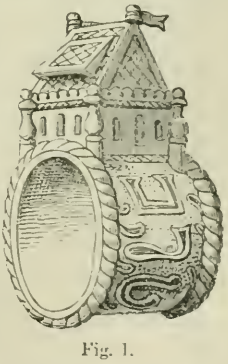

Fig. 1.

Various explanations have been given of the connection of the ring with marriage. It would appear that wedding-rings were worn by the Jews prior to Christian times. Fig. 1 shows a Jewish marriage-ring beautifully wrought in gold filigree, and richly enamelled, now in the possession of Lord Londesborough. It has been said that as the delivery of the signet-ring to any one was a sign of deputing or sharing of authority, so the delivery of a ring by husband to wife indicated her admittance to share his rights and privileges. In pagan times in Europe the ring seems to have been connected with fidelity or with espousals. Fig. 2 shows a form of betrothal-ring called a *gimmel*, or linked ring, which was used in later times; the upper fig. shows the three

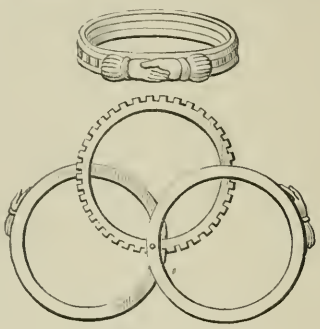

Fig. 2.

parts brought together, the lower fig. the parts separately. By an ancient Norse custom, described in the *Eyrbrygia Saga*, when an oath was imposed, he by whom it was pledged passed his hand through a silver ring, sacred to that ceremony; and in Iceland the ceremony of betrothal used to be accompanied by the bridegroom passing his four fingers and thumb through a large ring, and in this manner receiving the hand of the bride, as is represented in a woodcut in an old edition of *Olaus Magnus*. As lately as 1780 the practice existed in Orkney of a man and woman plighting their faith at the Standing Stones of Stennis by joining their hands through the perforated Stone of Odin. For betrothal, as well as for marriage, a ring is commonly bestowed; and in many countries both spouses wear wedding-rings. Although the third finger of the left hand is the official finger, rings are worn on all fingers, and in mediæval times even the thumbs were frequently decorated with large and massive rings. During the 16th, 17th, and 18th centuries it was a very common practice to have mottoes inscribed on rings (fig. 3), including wedding-rings, and the motto was called the *posy* or *chanson*. The ring was the symbol of the dominion of Venice over the Adriatic; and yearly, on Ascension Day, a ring was thrown by the Doge from the ship *Bucentaur* into the sea, to denote that as the wife is subject to her husband, so is the Adriatic Sea to the republic of Venice. The reception of a ring forms an essential feature in the investiture of many Catholic dignitaries; and even in the Anglican communion a sapphire 'pontifical' ring was presented in September 1891 to the new Archbishop of York. The 'fisherman's ring,' containing an engraved representation of St Peter in an ancient fishing-boat, is the official ring of investiture of the pope. It is broken and remade on the death of each pontiff, and

Fig. 3.

when presented to the new head of the church he declares the name under which he desires to rule, which name is thereafter engraved on it. Cardinals on their elevation receive a sapphire ring, and bishops on their consecration are also invested with a special ring. The reception of novices into Catholic sisterhoods is accompanied with the presentation of a ring, which is worn as a badge of espousal to the church. In the investiture of sovereigns the ring also occupies an important place in the coronation ceremonial. In addition to these, special rings were formerly worn by serjeants-at-law, who also on receiving silk made presents to various functionaries of rings (100 sometimes, costing £55 in all, cf. *Notes and Queries*, 1884). Moreover, the knightly orders, masonic bodies, and merchants employed distinctive rings for enabling them to claim the privileges of their orders or to facilitate their business. The carrying of seals attached to the watch-chain in the first place, and next the introduction of gummed envelopes, have had no small influence in decreasing the official importance of rings.

See the article GEM; *Finger-ring Lore*, by W. Jones (1877), an elaborate compilation of the practices, superstitions, and traditions connected with rings. See also King's *Antique Gems and Rings* (1872); *History and Poetry of Finger-rings*, by C. Edwards (New York, 1880); articles by Waterton, Fortnum, and others in *Archæological Journal*; and F. Schneider, *Die Gestaltung des Ringes vom Mittelalter bis in die Neuzeit* (Mainz, 1878).

Ringan, ST. See NINIAN.

Ringbones. This term is applied to osseous or bony growths which are found upon the upper and lower pastern bones of the horse. They are of two kinds, true and false. The false ringbone is an exostosis situated above the middle of the long pastern bone, and as a rule gives no inconvenience, and unless very large is not looked upon as an unsoundness. The true ringbones, which are of two kinds—viz. high and low—are always to be considered as constituting an unsoundness of the gravest character, involving the articular ends of the bones, and giving rise to obstinate and often incurable lamenesses. The high ringbone involves the pastern joint, and the low ringbone the coffin joint, and is partly within the horny foot; in many cases both the high and the low ringbones are coexistent. Ringbones vary in size, but the degree of lameness does not depend upon the mere size of the new formation. Very often the 'ring' may be a mere segment appearing only upon the side of the limb; in other cases it may completely envelop the whole circumference. Ringbones are hereditary, and it is unwise to breed from an animal having a ringbone.

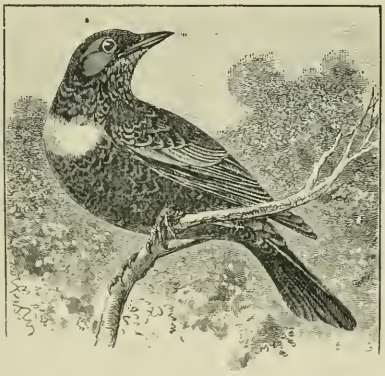
The treatment should be complete rest, fomentations and poultices at first, and afterwards blistering, firing; and in cases that do not give way to these remedies the 'nerve operation' should be performed.

Ring-dove. See PIGEON.

Ring Money. In early commerce, before the invention of coinage, but after the inconveniences of direct barter became evident, the precious metals in the form of rings and other personal ornaments were used as a medium of exchange. The employment of gold and silver as currency in this form among the early Egyptians is proved by contemporary wall-paintings showing the weighing of gold and silver rings, one such picture occurring in the decorations of a rock-grotto associated with the cartouche of Amenophis II. The allusion also in Genesis, xliii. 21, to the sons of Jacob finding their money 'in full weight' in the mouth of their sacks, may be taken as indicative of such a currency at a time when coinage of

definite weight and value did not exist. A similar currency appears to have been in use among certain western communities at a much later period. A Norse law made about 1220 alludes to an established ring money, of which, however, each ring was of definite weight. It has been suggested that many ancient Celtic ornaments of gold and silver had a definite weight and value to fit them for exchange purposes; but, while it is certain that these objects served both for personal adornment and for purposes of traffic, it has not been proved that they were made to any standard of weight or value. Cæsar mentions that in Gaul and Britain gold and silver rings were used as money. Among the modifications of ring money in use in different countries may be mentioned the silver fish-hook money of Ceylon, mentioned by Tavernier, of the form of a flat wire bent into a hook, and issued as late as 1659. At the present day ring money for African traders is regularly manufactured at Birmingham of copper, or an alloy of copper, and is known under the name of 'Manillas.'

Ring Ouzel (*Turdus torquatus*, or *Merula torquata*), a species of thrush, rather larger than a blackbird. It is a native chiefly of the western parts of Europe; it spends the winter in the south of Europe, Northern Africa, Syria, and Persia, and visits more northern regions in summer. It occurs frequently in many parts of the British Islands, where it breeds even in the Orkneys, but in very few districts does it remain all the year round. It is seldom seen in the more cultivated and thickly-peopled districts, preferring mountain-slopes, heaths, and their vicinity. It begins to breed in the later part of April, and makes its nest generally in heathy banks, often under a bush.



Ring Ouzel (*Turdus torquatus*).

The nest is made of coarse grass, within which is a thin shell of clay, and an inner lining of fine dry grass. The eggs are usually four in number, and are greenish blue in colour, flecked and spotted with reddish brown; and not infrequently there is a second brood in July. The food consists of worms, slugs, insects, and moorland berries, and the bird often makes raids upon fruit-gardens in its neighbourhood; while in vine countries it feeds largely upon grapes. In some parts of Scotland it is known as the *Moor Blackbird*. It is of a dark-brown, almost black, colour; the feathers are edged with blackish gray, the wing feathers more conspicuously with gray, and there is a broad crescentic white gorget—whence the name. The legs and feet are brownish black. The female is lighter and browner, with a narrower and duller gorget. The song consists of a few loud, clear, and plaintive notes, but is somewhat monotonous. See also OUZEL, and for the Water Ouzel, DIPPER.

Ringwood, a town of Hampshire, on the Avon, 25 miles WSW. of Southampton. Pop. of district, 5545.

Ringworm (*Tinea tonsurans*) is a disease dependent on the presence of a parasitic fungus, known to botanists as the *Trichophyton tonsurans*, and discovered in 1844 by Malmsten. The fungus consists of a mycelium, or network of threadlike filaments, with oval, transparent spores, about $\frac{1}{7000}$th of an inch in diameter, for the most part connected in chains, but sometimes isolated. When found on the surface of the body the fungus grows in the epidermis; but on the scalp, where it is most common, it is chiefly seated in the interior of the hair-roots. The diseased hairs lose their elasticity and break when they have risen a line or two above the scalp.

Ringworm of the Body (*Tinea circinata; Tinea marginata*) first appears as a rose-coloured and slightly-elevated spot about the size of a threepenny-piece, on which a bran-like desquamation of epidermis soon begins, accompanied by slight itching. This spot gradually increases in size, but retains its circular form; and as it extends, the healing process commences at the centre, so that the circular red patch is converted into a ring, enclosing a portion of healthy skin; and a ring thus formed may continue to increase till it reaches a diameter of four inches, or even more. It is apt to affect the face, the neck, the back, and the outside of the wrist. This form of ringworm frequently terminates spontaneously.

Ringworm of the Scalp (*Tinea tonsurans*) usually occurs in children, and is especially prevalent when the nutrition is defective, or there is a scrofulous taint in the constitution. In infants, and after the age of puberty, it is rare, and can usually be readily cured. It appears in the form of round, scaly, irritable patches on different parts of the head; and the irritation often occasions the formation of minute vesicles. The hairs at these spots become dry and twisted, and are easily removed, but when the disease advances they break close to the scalp if an attempt is made to extract them. The stumps, and the epidermis surrounding them, become covered with a characteristic grayish-white powder, consisting of the sporules of the fungus. The diseased parts are slightly elevated and puffy, and differ from the healthy scalp in colour, being bluish or slate-coloured in dark persons, and grayish red or yellow in fair patients. The inflammation will last as long as the growth of the fungi continues; and even when they die spontaneously, as sometimes occurs, the affected spots may become bald in consequence of the hair-bulbs having become atrophied. This condition, however, generally passes off in time. In some children only single hairs here and there may become or remain affected, and such cases are particularly apt to lead to the spread of the disease, because they are difficult to detect, and often escape recognition.

Ringworm is also sometimes met with in the beard, giving rise to one form of the troublesome disease known as Sycosis. Ringworm is extremely contagious; and when a case of it occurs in a family or a school strict precautions are necessary to prevent its spreading to others. The greatest care should be taken that no brushes, sponges, towels, caps, &c. touched by the patient are used by others. The hair should be kept short, and the scalp anointed daily with carbolic oil, 1 in 20; a cap of linen or oilsilk should be worn night and day; and whatever remedy is selected should be steadily and perseveringly applied. No child with ringworm should be allowed to go to school, unless under very special precautions, nor to the hatter or hairdresser; and intercourse with other children

should be permitted as little as possible except in the open air.

Treatment.—Ringworm of the body is usually not difficult to cure. The application of some parasiticide, white precipitate ointment, solution of sulphurous acid, tincture of iodine, usually quickly kills the parasite and so ends the disease. Ringworm of the scalp, on the other hand, is often an extremely intractable affection, because the parasite extends deep into the hair-follicles, and it is very difficult to bring the remedies employed satisfactorily in contact with it in this situation. In recent cases the remedies recommended above are often effectual; but those which have become chronic sometimes tax the ingenuity of the physician and the patience of the nurse to the utmost, and may even last till advancing years make the soil unfavourable for the further growth of the parasite.

Ringworm in the lower animals, as in the human subject, consists of the growth of a vegetable fungus on the surface of the skin, is common amongst young animals, is decidedly contagious, and communicable from man to the lower animals, and probably, also, from the lower animals to man. Commencing with a small itchy spot, usually about the head or neck, or root of the tail, it soon spreads, producing numbers of scurfy circular bald patches. It is unaccompanied by fever, and seldom interferes seriously with health. After washing with soap and water, run over the spots lightly every day with a pencil of nitrate of silver, or rub in a little of the red ointment of mercury, or some iodide of sulphur liniment. See works by A. Smith (3d ed. 1885) and G. Thin (1887).

Riobamba. See CAJABAMBA.

Rio Bravo. See RIO GRANDE.

Rio Cuarto. the second city in the Argentine province of Cordoba, formerly called Concepcion, occupies an important strategic situation on the river of the same name, 500 miles NW. of Buenos Ayres and 170 by rail S. of Cordoba. Pop. 12,000.

Rio de Janeiro. a maritime state of Brazil, lying between Espirito Santo, Minas Geraës, and São Paulo. Area, 26,627 sq. m.; pop. without the city (1888) 1,164,468. The coast is low and swampy, the interior mountainous and healthy; the chief ranges are the Serras dos Orgãos (5750 feet) and da Mantiqueira in the extreme west (8900). The principal river is the Parahyba. There are still considerable forests, though they have been greatly thinned. Coffee is the chief agricultural product, and after that sugar and cotton. Sugar-houses, distilleries, breweries, and manufactories of cottons, hats, and cigars are numerous. The state contains iron, kaolin, marble, &c. The capital is Nicteróhy (Nictheroy), opposite the city of Rio; with São Domingo and Praia Grande it has 20,000 inhabitants. The German colonies in the state have a pop. of over 15,000.

Rio de Janeiro. the capital of Brazil, stands on the west side of one of the most magnificent natural harbours in the world. An inlet of the Atlantic, the bay of Rio de Janeiro runs northwards for some 15 miles, varying in width from 2 miles to 7; it is girdled on all sides by picturesque mountains, covered with tropical vegetation. The entrance, which is less than a mile wide, passes between two bold headlands, on one of which is a steep conical mass called the Sugar-loaf (1270 feet). The city and its suburbs stretch nearly 10 miles along the shore, climbing up the numerous irregular eminences and dipping into the little green valleys between them, whilst great mountain-ranges (1500 to 3000 feet) shut in the background. About 3 miles SW. of the city stands the precipitous cone of Corcovado (2336 feet), up which a cog-railway carries 50,000 visitors every year to enjoy the magnificent view. The streets are mostly narrow and often mean, and the houses and public buildings, though generally quaint and gay with colour, seldom boast of any very striking architectural features. Although Rio has few magnificent public buildings, it possesses very useful public institutions, as the vast hospital of La Misericordia (1200 patients), the national library (1807), with nearly 150,000 volumes, the national museum (with unique collections), the large lunatic asylum (1841) at the suburb of Botafogo, the botanical gardens with a celebrated avenue of palms (beyond Botafogo), the observatory, the Geographical and Historical Institute (1838), the former royal palace at São Christovão, the arsenal, the naval dockyards, the academy of fine arts, a cadet-school, a school of medicine, a 'Pasteur' institute, a conservatory of music, a polytechnic school, &c. In spite of a good water-supply, chiefly by an aqueduct (1750) 12 miles long, and a new system of sewage-draining, the city is not very healthy; the surrounding hills shut out the breezes, and the heat grows intense in summer. Yellow fever prevails during the hot season; and the Negro population suffer from smallpox. Pop. (1872) 274,972; (1890) 522,651, including many foreigners—Portuguese, British, French, and Germans.

Rio is also the commercial capital, sending out 51 per cent. of the total exports of the country, and bringing in 45 per cent. of the imports. The exports average £10,895,000 a year in value, all except about half a million sterling being for coffee; of the total, £6,500,000 go to the United States, more than £1,000,000 to Germany; Great Britain buys £500,000 less than France and Austria. The imports, chiefly cotton, gold and silver, metals, wool, provisions, and machinery, average about £12,735,000 a year. Great Britain supplies 5¼ millions sterling of this, Urugnay and Argentine Republic about 3½ millions, France close upon 2 millions, and Germany nearly 1½ million. The whole sea-frontage of the city is lined with quays, and in 1889 extensive new harbour-works were begun, embracing a dock of 75 acres, a breakwater 3200 yards long, an elevated railway, hydraulic cranes, warehouses, &c. There enter every year some 1500 vessels of 1,674,000 tons, about one-third (614,000 tons) British. The city possesses cotton, jute, and silk mills, tobacco and hat factories, machine-shops, tanneries, &c.

On 1st January 1531 a Portuguese captain, Alphonso de Souza, entered the bay, and thinking it was the mouth of a large river he called it Rio de Janeiro—i.e. January River. The French established themselves on one of its islands (Villegagnon) in 1555; but they were driven away by the Portuguese in 1567. Rio was founded in the preceding year; was plundered by Duguay-Trouin in 1711; supplanted Bahia as the capital of the viceroy in 1763; and in 1822 was made the capital of the empire of Brazil. The revolution of 15th November 1889, which transformed the empire into a republic, centred in Rio; and its bay was the scene of most of the naval fighting in the revolution of 1893-94. The federal district in which the city stands (area, 538 sq. m.; pop. 800,000) is administered directly by the federal authorities.

Rio Grande, also *Rio Grande del Norte*, and *Rio Bravo del Norte*, a large river of North America, rises in the San Juan Mountains in south-western Colorado, and flows generally south-eastward into the Gulf of Mexico, forming on its way the entire boundary between Texas and Mexico. Its length is about 1800 miles; it is for the most part a shallow stream, but small steamboats can ascend for nearly 500 miles. Its chief affluent is the Rio Pecos.—See also, for other Rio Grandes, PARANÁ and SENEGAMBIA.

Rio Grande do Norte, a maritime state of Brazil, occupies the north-east angle of the country, and is bounded on the N. and E. by the Atlantic. Area, 22,195 sq. m.; pop. (1890) 268,273, one-half Indians. It derives its name from the river Rio Grande, which flows into the Atlantic at the capital, Rio Grande do Norte or Natal (q.v.); but the principal river is the Piranhas. The surface is flat along the shores, which are skirted by dangerous shoals and reefs, but is mountainous in the interior. The principal crops are sugar and cotton; large herds of horses and cattle are reared on the extensive pastures.

Rio Grande do Sul, the southernmost province of Brazil, is bounded on the N. and W. by the river Uruguay, on the S. by the republic of Uruguay, and on the E. by the Atlantic. Area, 91,310 sq. m.; pop. (1890) 897,455, of whom 100,000 are Germans and 52,000 Italians. The northern portion of the province consists of an elevated plateau, the edges of which are heavily timbered; the southern half is a rolling grassy plain, on which large numbers of cattle are kept. The climate is healthy, well suited for Europeans, and the Germans and Italians have established large and prosperous colonies here. All the cereals and fruits of central Europe can be grown advantageously, and the inhabitants are awakening to the importance of developing the immense agricultural resources of the province. The fisheries are of some importance. Along the coast stretch the two lagoons, Dos Patos (174 miles long by 34 wide) and Mirim, connected by a navigable channel. The principal articles of export are beans, horns, hair, hides, bones, tallow, jerked beef, tongues, and mandioc flour, reaching nearly half a million sterling in value. The imports, valued at 1½ million pounds sterling, consist of cotton, woollen, and linen manufactures, coal, earthenware, and hardware. The principal towns are Porto Alegre (q.v.), the capital, Rio Grande, and Pelotas.—The town of Rio Grande stands on the south side of the strait leading into the southern end of the Lagôa dos Patos. Pop. 18,000. In January 1891 a beginning was made with the work of removing the sand-bar that obstructs the entrance, the intention being to deepen the harbour and eventually make Rio Grande a great port for southern Brazil.

Rioja, a western province of the Argentine Republic, with an area of 34,365 sq. m. and a pop. of about 80,000. Much of it is desert, but in the west there are very fertile Andes valleys, where wheat, maize, vines, cotton, and tropical fruits are grown. Copper, silver, and gold are mined.—Rioja, the capital, founded in 1591, lies at the foot of the Sierra Velasco, among orange groves and vine-clad hills, 350 miles by rail NW. of Cordoba. Pop. 6000.

Riom, a town of France (dept. Puy-de-Dôme), is picturesquely situated on a hill, 8 miles by rail N. of Clermont-Ferrand. It is built of dark lava, and is a perfect treasury of domestic architecture, especially of the Renaissance period. There is considerable trade, and tobacco, linen, and machinery are manufactured. Pop. 9689.

Rion. See Phasis.

Rio Negro, (1) one of the principal affluents of the Amazon River, rises as the Guainia in south-eastern Colombia, and flows east into Venezuela, then south into Amazonas in Brazil, and again east and south-east until it empties into the Marañon, after a course estimated at 1350 miles. Its chief tributary on the right is the Uaupes; on the left it receives the Cassiquiare (q.v.), by means of which communication is established between the Orinoco and the Amazon, and also the Cababuri, Branco, and other streams. It is over a mile broad when its clear, inky-black stream enters the yellow, muddy Amazon. A few miles from its mouth is Manáos (q.v.), on the left bank; and higher up the river opens into great lagoons, nearly choked with numerous islands. See A. R. Wallace's *Travels on the Amazon and Rio Negro* (1853).—(2) A river of Argentinia, which rises in the Andean lake of Nahuel-Huapi, flows north-east as the Cunnonilla and afterwards the Limay, and receives the name of Rio Negro at its junction with the Neuquen, after which it flows east and south-east into the Atlantic Ocean. It is over 500 miles long, and for small steamers it is navigable all the way. Near its mouth there are great saline lakes, from which immense quantities of salt are collected. It bounds on the north and gives its name to a national territory, formerly part of Patagonia, and now containing an area of 81,895 sq. m. of for the greater part level but barren soil. The chief town is Viedma (pop. 1500), 20 miles from the mouth of the Rio Negro.

Rionegro, a town of Colombia, in Antioquia, some 15 miles SE. of Medellin. It was founded in 1545, and the National Convention met here in 1863. Pop. 9000.

Rionero, a town of Southern Italy, 12 miles N. of Potenza; it suffered greatly from earthquake in 1851. Pop. 11,383.

Riot consists in the joint unlawful action, by breach of the peace or by causing terror to the public, of three or more persons assembled together whether they originally assembled for these purposes or no. When a riot becomes formidable any justice of the peace may command the persons assembled, if not less than twelve in number, to disperse peaceably by a form of words called reading the Riot Act (1 Geo. I. chap. 5), thus: 'Our Sovereign Lord the King (or Lady the Queen) chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in an Act of King George for preventing tumults and riotous assemblies.—God save the King (or Queen).' (The omission of these last four words makes the reading nugatory.) To justify the use of military force in the prevention of serious outrages and damage to persons and property, it is not necessary to wait for the proclamation being read, still less to wait for an hour after it has been read. Though death or wounds result to those composing the mob, such hurt is not a criminal offence. The rioters are guilty of felony, and are liable to penal servitude for life. Prosecutions under the Riot Act must be commenced within twelve months of the time of committing the alleged offence. Sometimes the Riot Act is read more than once during the disturbance, in which case the second or third reading does not supersede the first. The Riot Damages Act, 1886, provides compensation from the rates to those whose property is damaged during a riot. Less serious than *riot* are *unlawful assembly*, a meeting of three or more for an unlawful object, but where no part of the object is actually carried out; and *rout*, where the assembly proceeds to execute the act, but does not actually accomplish it; and *affray*, that is, a fight between two or more in some public place (e.g. a prize-fight), but it must not be premeditated. In private the disturbance would be an *assault*. Among notable riots have been those in Scotland on account of the Union (1707); the Porteous Mob in Edinburgh (1736); Lord George Gordon's 'No Popery' Riots (1780); at Birmingham (1791) in connection with the Commemoration of the French Revolution; the Luddites (1811, 1812); Peterloo (1819); Reform Riots at Bristol (1831); Chartist Riots (1838–39); Rebecca Riots in Wales (1843); religious riots at Belfast

(1852, 1862, 1872, 1886, 1887); Reform Riots in Hyde Park (1866); Trafalgar Square Riots (1886, 1887); Tithe Riots in Wales (1887). See S. Hastings, *The Law relating to Riots* (1886). The American laws as to riots follow in the main the law of England, but are less stringent in their application, and less severe in the punishments incurred. Amongst the most memorable riots in the United States were the Doctors' Riot at New York (1788); the Astor Place Riot, directed against the English actor Macready (1849); the Draft Riots in New York (1863); and the Anarchist Riot in Chicago (1886).

Rio Tinto, a river in southern Spain, in the province of Huelva, near whose sources are rich copper-mines; the annual output (copper and sulphur) reaches 1,400,000 tons; these minerals are exported from the port of Huelva (q.v.), 45 miles distant by rail, near the mouth of the river. These mines were worked by the Romans—their *Tharsis*. During the years of Moorish supremacy they were unused, but they have been worked again since the middle of the 16th century. They were bought in 1872 by the Rio Tinto (London-Bremen) Syndicate for £4,000,000. Some 10,500 persons are employed in the works, of whom unhappily something like 10 per cent. are usually ill by reason of the unhealthiness of the work. See W. R. Lawson, *Spain of To-day* (1890).

Riouw, capital of the island of Bintang (q.v.) and headquarters of a Dutch residency comprising Bintang, the Lingga islands, and other groups between the extremity of Malacca and the coast of Sumatra.

Riparian Rights. See Rivers.

Ripley, (1) a town of Derbyshire, 10 miles NNE. of Derby, with silk-lace manufactures and large neighbouring collieries and ironworks. Pop. (1851) 3071; (1891) 6815.—(2) A pretty village in the West Riding of Yorkshire, on the Nidd, 3½ miles NNW. of Harrogate. Rebuilt in 1829–30, it has an hôtel-de-ville (1854), an interesting church, and Ripley Castle (1555), where Cromwell is said to have slept the night before Marston Moor. Pop. 291.

Ripley, George, was born at Greenfield, Massachusetts, 3d October 1802, graduated at Harvard in 1823, afterwards studied theology there for three years, and was ordained to a pastorate in Boston. This he held till 1841. In the meantime he had joined actively in the Transcendental movement—the first meeting of the club was at his house in 1836; and on leaving the pulpit he at once started the Brook Farm (q.v.) experiment. This came to an end in 1847, and Ripley removed to New York, when he afterwards engaged in literary and journalistic work. He was joint-editor with Charles A. Dana of Appleton's *New American Cyclopædia*. He died 4th July 1880. See Life by O. B. Frothingham in the 'American Men of Letters' series (1882).

Ripon, a city in the West Riding of Yorkshire, on the Ure, 23 miles NW. of York, 28 N. of Leeds, and 11 N. of Harrogate. A monastery, founded here in 660 by St Cuthbert and other monks of Melrose, was granted about 664 to St Wilfrid, who rebuilt the church with stone, and dedicated it to St Peter. Willibrord, the apostle of the Frisians, was trained in this monastery, which in 678 was made the seat of a short-lived bishopric, re-erected in 1836 after a lapse of more than eleven centuries. The beautiful minster, which from the Conquest to the Dissolution was the church of Augustinian canons, was built between 1154 and 1520, so exhibits every variety of style from Transition-Norman to Perpendicular. A cruciform pile, 266 feet long, with three towers 120 feet high, which lost their spires in 1660, and with a Saxon crypt, where a hole called 'St Wilfrid's Needle' was anciently used as an ordeal of chastity, it suffered much through the Scots (1319), decay, and vandalism, but in 1861–76 was restored by Sir G. G. Scott at a cost of £40,000. An obelisk, 90 feet high, in the market-place was erected in 1781 by W. Aislabie, for sixty years one of the two members for Ripon, whose representation was reduced to one in 1867, and merged in the county in 1885. A free grammar-school was founded in 1546. Studley Royal, the fine seat of the Marquis of Ripon, is 2 miles south-west; and near it is Fountains Abbey (q.v.). Ripon spurs, once so famous, belong to the past, but saddle-trees are still manufactured, besides varnish, leather, machinery, &c. The municipal borough was chartered by James I. Pop. (1851) 6081; (1881) 7390; (1891) 7512.

See works by Gent (1733), Waddilove (1810), Walbran (9th ed. 1871), and Fowler (3 vols. 1881–88); and on the Cathedral by Archdeacon Danks (1899).

Ripon, Frederick John Robinson, Earl of, was born 1st November 1782, the second son of the second Lord Grantham. After graduating at Cambridge, in 1806 he entered parliament as a moderate Tory, and had successively been Under-secretary for the Colonies, Vice-president of the Board of Trade, and Chancellor of the Exchequer, when, having that same year been created Viscount Goderich, in August 1827 he became head of a seven months' administration. He held office afterwards as Secretary for the Colonies, Lord Privy Seal, and President of the Board of Trade; in 1833 was created Earl of Ripon; and died 28th January 1859.

George Frederick Samuel Robinson, Marquis of Ripon, was born in London 24th October 1827, and succeeded his father as Earl of Ripon and Viscount Goderich, his uncle as Earl de Grey, Baron Grantham, and a baronet. Since 1852 he had sat in parliament as a Liberal for Hull, Huddersfield, and the West Riding, and he became successively Under-secretary for War (1859), Under-secretary for India (1861), Secretary for War (1863), Secretary of State for India (1866), Lord President of the Council (1868), Grand-master of the Freemasons (1870, which office he resigned in 1874 on his conversion to Catholicism), Marquis of Ripon (1871), Viceroy of India (1880–84, where he was popular with the natives, unpopular with Anglo-Indians), First Lord of the Admiralty in 1886, and Colonial Secretary in 1892 and 1894.

Rip Van Winkle, the hero of Washington Irving's delightful sketch (1820), an idle, good-natured, henpecked scapegrace, who neglects—he cannot be said to cultivate it—a patch of maize and potatoes in a small village near the Hudson River, and who, with his gun and dog Wolf, his companion in idleness, seeks a refuge from the scolding tongue of his sorely-tried but termagant wife in the forests of the Catskill Mountains. There he falls in with Hendrick Hudson and his crew of the *Half Moon*, who are playing at ninepins in a secluded hollow, the balls as they roll echoing along the mountains like rumbling peals of thunder. Rip is directed to wait on them, and while doing so tastes and returns to the liquor he hands, till his senses forsake him. He wakens on a bright summer morning, his dog gone, and a rusty firelock by his side; his beard has grown a foot long, and in the village he finds new buildings, new names over the doors, new faces at the windows. His own house is fallen into decay, his wife is dead—there is a drop of comfort, at least, in this intelligence—and he who went away a subject of George the Third has returned to find himself a free citizen of the United States. His

sleep, he discovers, has lasted twenty years, and meantime the American Revolution has passed and left all things changed. Rip, however, is recognised by some of his old cronies, finds a home at his daughter's house, and for many more years is as comfortable at the door of the new wooden Union Hotel as ever he was at old Nicholas Vedder's quiet Dutch inn. The story has been often dramatised in America, but no version has held the stage except Boucicault's (1865), with which the name of Joseph Jefferson is identified. The opera by Planquette (1882) also deserves mention, as keeping pretty closely to the story.

Rishanger, WILLIAM, a monk of St Albans, who styles himself 'Chronigraphus' in an extant memorandum written by himself in 1312. He tells us, moreover, that he had been forty-one years a monk, and was then sixty-two years old, so that he must have been born in the year 1250. It has been usual to consider his *Chronica*, which covers the period from 1259 to 1307, as a continuation of Matthew Paris, and it has been to a large extent borrowed from the *Annales* of the Dominican Friar, Nicholas Trivet. For example, as Mr Gairdner points out, the whole reign of Edward I. is almost exactly identical in the two. As a chronicler Rishanger is full and truthful, but his work is fragmentary towards the close, and besides some confusion has crept into the order of the narrative. The story is told with considerable spirit, and reveals high admiration for Simon de Montfort. The *Willelmi Rishanger Chronica et Annales*, forming vol. iii. of the *Chronica Monasterii S. Albani*, was edited for the Rolls series by H. T. Riley (1865).

Rishi is the title given to the inspired poets of the Vedic hymns. See VEDAS.

Risotto, an Italian dish, consisting chiefly of rice. Onions are shred into a frying-pan with plenty of butter, and they are fried together until the onions become very brown, and communicate their colour to the butter. The butter is then run off, and to this is added some rich broth, slightly coloured with saffron, and the whole is thickened with well-boiled rice, and served up instead of soup at the commencement of a dinner.

Ristigouche. See RESTIGOUCHE.

Ristori, ADELAIDE, an Italian tragédienne, was born on 26th January 1821, at Cividale in Friuli. Her parents were strolling players, and she almost began life in the theatre. At the age of fourteen she played in *Francesca da Rimini*, and in a few years became the leading Italian actress. In 1847 her marriage with the Marquis Del Grillo (died 1861) temporarily interrupted her dramatic career; but she soon returned to the stage. After having acted in Italy for some years with immense applause, she presented herself before a French audience in 1855, when Rachel was at the height of her fame. But Ristori won a complete triumph; and thereafter gained fresh laurels in nearly every country of Europe, in the United States (in 1866, 1875, and 1884–85), and in South America, where her magnificent tragic acting roused the greatest enthusiasm. The rôles in which she especially shone were Mary Stuart (Schiller's), Elizabeth (Giacometti's), Medea and Marie Antoinette (Legouvé's), Lady Macbeth, and Adrienne Lecouvreur (Scribe's). See her *Studies and Memories* (Eng. trans. from French, 1888).

Ritchie, MRS RICHMOND. See THACKERAY.

Ritornello, in Music, in its original sense, a short repetition, like that of an echo, or a repetition of the closing part of a song by one or more instruments. The same term has, by later usage, been applied to all symphonies played before the voices begin which prelude or introduce a song, as well as the symphonies between the members or periods of a song. The name is also given to the oldest form of the Italian popular poetry, and consists typically of a strophe of three Iambic lines, the first and third rhyming.

Ritschl, ALBRECHT, Protestant theologian, was born 25th March 1822, at Berlin, where his father was a clergyman. His university studies were carried on at Bonn, Halle, Heidelberg, and Tübingen. In 1846 he 'habilitated' at Bonn, the subject of his thesis (in the treatment of which he substantially reflected the views of his Tübingen master, Baur) being the relation between the gospel of Marcion and the canonical gospel of Luke. His next published work, on the origin of the early Catholic Church, was of similar tendency, though seeking to modify the conclusions of his contemporary Schwegler as to the influence and extension of Ebionitism in the apostolic and post-apostolic age; but in the second and completely rewritten edition of the same work he took up towards the fundamental positions of the Tübingen school an attitude of antagonism, which he ever afterwards maintained. He now denied the alleged Ebionitism of primitive Christianity altogether, and, accepting as genuine the epistles of James and Peter as well as the Apocalypse and Acts, maintained that none of the apostles had regarded the law as religiously binding, and that they only continued its observance as a national custom among Jews, leaving Gentile converts free. Ritschl, who had become professor extra-ordinarius of Theology at Bonn in 1853, was promoted to an ordinary professorship in 1860, and in 1864 was transferred to Göttingen, where the rest of his life was spent. His lectures, especially those on Christian ethics, soon became famous for their originality and vigour. While in Bonn he had also published a tract on the relation between the church and its confession (1854), and a Latin dissertation on the wrath of God (1859). The list of his Göttingen publications includes, besides his principal work, a treatise on Christian perfection (1874), a tract on conscience (1876), a history of Pietism (1880–86; 3 vols.), a tract on theology and metaphysics (2d ed. 1887), and a volume containing three academical discourses (1887). He died at Göttingen, 20th March 1889.

His principal work, on the Christian doctrine of justification and reconciliation, was published in three volumes (1870–74; 3d ed., with noteworthy alterations, 1888), the first of which traces the history of the doctrine, the second discusses its biblical premises, and the third its theological meaning. An English translation of the first volume by the present writer appeared in 1871. The work as a whole expounds with much force and effectiveness a theological system marked by great dialectic acuteness and subtlety, ingenious and searching exegesis, and bold disregard of ecclesiastical tradition. The distinguishing feature of the Ritschlian theology is perhaps the prominence it gives to the practical, ethical, social side of Christianity. As a reasoned system it starts from a definite theory of cognition, eclectically derived from Kant through Lotze, which has sometimes been called a subjective idealism, and criticised as denying all objective reality to the objects of theology. But hardly with justice. For, though doubting the possibility of demonstrating God to the merely speculative intellect, Ritschl holds that God is really, effectively, practically revealed to man on his religious side; in other words, becomes known to those who have found their need of Him. God is to be thought of as love: there is no other conception of equal value. In particular the conception of His holiness is an obscure one, and His righteousness

is in fact identical with His grace. All metaphysical statements as to His absoluteness or existence through, or in, or for Himself are of no religious value. In connection with his doctrine of God, Ritschl attaches high importance to the conception of the church as being the community within which alone men can have reconciliation with God and freedom from the sense of guilt, and so be able to act from motives of love, and realise that human and divine fellowship of perfect love which is the kingdom of God. In this Ritschl expressly differs from Schleiermacher (in many other respects a master whom he follows closely); but, while rejecting the Protestant formula of the latter, that the relation of the individual to the church depends on his relation to Christ, he is very far removed from the position of Roman Catholicism. His doctrine of Christ attaches no value to the hypostatical distinction of persons in the Godhead or to the ecclesiastical doctrine of the two natures or the three offices, but states the divinity of Christ in terms of His peculiar and unique relation to the church, which He founded by His life and work on earth. This work was atoning work; but the reconciliation with God and immunity from the sense of guilt which He secured for the church were obtained not by vicarious endurance of the punishment due to sinful men, but by His perfect fulfilment, in loving deed and word, of the work of His calling, and by His perseverance in it in spite of all opposition, and by His patient endurance of all suffering even unto death. The justification possessed by the Christian as a member of Christ's community is practically shown in his freedom or dominion over the world. This dominion is exercised, in trust in God's providence, by patience, by humility amid all the vicissitudes of life, by faithfulness of the individual to his calling as being his contribution to the kingdom of God, and by Christian prayer, which is chiefly thanksgiving or humble recognition of the divine rule. Ritschl is usually classified as an 'eclectic mediating theologian;' perhaps 'intermediate' would be a better word, for his theology is uncompromisingly opposed alike by the 'rationalist' and by the 'orthodox' parties. The Ritschlians now form a large and important school in Germany, the most prominent among them being Kaftan, Herrmann, and Bender.

See the Life by his son Otto (2 vols. 1892–96); Stählin, *Kant, Lotze, and Ritschl* (trans. 1889); works by Pfleiderer (1891), Mielke (1894), and Pfennigsdorf (1896); and Garvie, *The Ritschlian Theology* (1899).

Ritschl, Friedrich Wilhelm, classical scholar, was born at Grossvargula, near Erfurt, 6th April 1806. He studied at Leipzig and at Halle, held chairs of Philology at Breslau (from 1834), Bonn (from 1839), and Leipzig (from 1865), and died at Leipzig on 9th November 1876. As a teacher he exercised great influence over his pupils, amongst whom were Curtius, Ihne, Brugmann, &c. His greatest work is an edition of Plautus (3 vols. Bonn, 1848–54; new ed. 1881–87), provided with the richest critical apparatus. This standard work was preceded by *Parerga Plautina et Terentiana* (Leip. 1845). He achieved a second triumph in the department of Latin inscriptions, his collection, *Priscæ Latinitatis Monumenta Epigraphica* (Berlin, 1864), being the forerunner of the great *Corpus Inscriptionum Latinarum.* Ritschl's numerous critical papers and dissertations are collected in *Opuscula Philologica* (5 vols. Leip. 1867–79). Ribbeck's Life of him is the best (2 vols. 1879–81); see also another by L. Müller (1878).

Ritson, Joseph, a learned and honest, but pedantic, acrid, and ill-mannered antiquary, was born of Westmorland yeoman family at Stockton-on-Tees, in 1752. He was bred to the law, and practised as a conveyancer in London, but was enabled by the profits of the office of Deputy Highbailiff of the Duchy of Lancaster to give most of his time to antiquarian studies. He made himself as notorious by his crazy vegetarianism, his whimsical spelling, and irreverence, as by the acerbity of his attacks on much bigger men than himself. Scott alone of his contemporaries kept good terms with him, but then none other had his large heart and genial humour. Undoubtedly Ritson's mind was deranged, and he died in a fit of gloom, 3d September 1803. Ritson's industry was remarkable, and all his forty books are valuable despite the blemishes in which they abound. His first important work was an abusive but well-grounded attack on Warton's *History of English Poetry* (1782). Next year he assailed Johnson and Steevens for their text of Shakespeare; in 1790 he attacked Bishop Percy with absurd ferocity in the preface to a collection of *Ancient Songs;* in 1792 appeared his characteristic *Cursory Criticisms* on Malone's Shakespeare.

Other works were *A Select Collection of English Songs* (3 vols. 1783); *Pieces of Ancient Popular Poetry* (1791); *The English Anthology* (3 vols. 1793–94); *A Collection of Scottish Songs* (2 vols. 1794); *Poems,* by Laurence Minot (1795); *Robin Hood: a Collection of all the Ancient Poems, Songs, and Ballads* (2 vols. 1795); *Bibliographica Poetica: a Catalogue of English Poets of the XII.–XVI. Centuries* (1802); and *Ancient English Metrical Romances* (3 vols. 1802). His various North Country *Garlands* and his *Essay on Abstinence from Animal Food as a Moral Duty* (1802) were less important. Joseph Haslewood wrote a short account of his Life (1824); his Letters were edited, with a Life, by Sir N. Harris Nicolas (2 vols. 1833).

Ritter, Heinrich, German philosopher, was born at Zerbst in Anhalt on 21st November 1791, studied theology and philosophy at Halle, Göttingen, and Berlin; was professor of Philosophy successively at Berlin (1824–33), Kiel, and Göttingen (1837–69); and died in Göttingen on 3d February 1869. His fame rests upon an extremely careful and impartial *Allgemeine Geschichte der Philosophie* (12 vols. 1829–55), with a continuation carrying on the work from Kant (1853); and upon *Die Christliche Philosophie* (2 vols. 1858–59).

Ritter, Karl, a geographer, was born August 7, 1779, at Quedlinburg in Prussia, was educated at Schnepfenthal under Guts Muths, studied in Halle, was in 1820 nominated professor of Geography at Berlin, became subsequently member of the Academy and Director of Studies of the Military School, and died 28th September 1859. With Ritter as the founder of general comparative geography begins a new epoch in the history of geographical science. His chief work (uncompleted) was *Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen* ('Geography in its Relation to Nature and the History of Men,' 10 vols. Berlin, 1822–59). The work is divided into four parts—(1) Central Asia, Siberia, China, and India; (2) West Asia; (3) Arabia; (4) Sinai Peninsula, Palestine, and Syria. Besides this he wrote an *Introduction to General Comparative Geography* (1852); *Europe* (2 vols. 1807); and *The Stupas, or the Architectural Monuments on the Indo-Bactrian Royal Road, and the Colossus of Bamian* (1838). His lectures were published in three volumes—*History of Geography* (1851), *General Geography* (1862), and *Europe* (1863)—by Daniel. His name is perpetuated in two geographical institutions in Berlin and Leipzig. See Life by Gage (Edin. 1867) and Kramer, *Carl Ritter, ein Lebensbild* (2d ed. Halle, 1875).

Ritual (Lat. *rituale,* 'book of rites'), the name of one of the service-books of the Roman Church, in which are contained the prayers and order of

ceremonial employed in the administration of certain of the sacraments (communion out of Mass, baptism, penance, marriage, extreme unction) and other priestly offices of the church, forms for churchings, burials, and blessing. In its present form it dates from the Council of Trent, which directed a revision of all the different rituals then in existence (also known as *manuale*, *sacerdotale*, &c.), which were numerous, and exhibited considerable variety of detail. Paul V., in 1614, published an authoritative edition, which has frequently been reprinted, and of which a further revision was issued by Benedict XIV. Besides the Roman Ritual there are many diocesan rituals, some of which are of much historical interest. In the Greek Church, as in the other eastern communions, the Ritual forms part of the general collection (which contains also the Eucharistic service) entitled *Euchologion*. In the Anglican Church the *Book of Common Prayer* may be said to contain the Ritual. The most approved commentary on the Roman Ritual is that of Barruffaldo (3d ed. 1763).

Ritualism, the name popularly but inaccurately given to the remarkable increase of ceremonial in the Church of England since about 1860–65. It may be considered as a development of Tractarianism, though it is one not contemplated by the authors of that movement, whose aim was rather to disseminate doctrines than to introduce ritual changes. Dr Pusey and his associates deprecated any innovations in the way of conducting the services, anything of ritualism, or especially any revival of disused vestments. Collateral causes of the movement may be said to be the great advance of æsthetic taste, and the increased cultivation of the fine arts in the service of religion; as also the extended study by the clergy of ancient liturgies, and the connection discovered to exist between them and the offices of the English Church. With the spread of High Church principles certain changes in the mode of conducting divine service had been introduced by the clergy, which, though unpopular at first, were widely adopted, and up to a certain point had received the sanction of the law. But the restored church with low and open benches; the separated chancel; the altar-table with coverings of different colour according to the ecclesiastical seasons, and candlesticks and a cross upon or over it; choral services, and weekly celebration of the communion, were all that had hitherto been attempted. To these comparatively small alterations important additions were subsequently made, bringing the usages of the Church of England nearer those of the Roman communion, such as special vestments at the celebration of the holy communion, and at certain other times—for the celebrant an alb, stoles of different colour, according to the seasons, and chasuble, and for the assisting ministers albs with tunicles; lighted candles on the altar at holy communion; incense burned either in a 'thurible' or in a standing vessel; the mixing of water with wine for the communion; the use of wafer-bread; elevation of the elements either during or after consecration; and processions with crosses, banners, and vested attendants.

The Public Worship Regulation Act, passed after fierce discussion in both Houses of Parliament, was expressly designed, as Mr Disraeli admitted, for the repression of ritualistic practices, and constituting a new judgeship for offences against the rubrics (see Ecclesiastical Courts). By its provisions, a complaint against the use of vestments, ornaments, and rites and ceremonies, or the omission of such as are ordained in the Book of Common Prayer, in the churches or burial-grounds of the Church of England, may be presented to the bishop of the diocese by an archdeacon or churchwarden, or by three parishioners, members of the church, of full age, and a year's residence in the parish. In the event of the parties not submitting to the directions of the bishop, he shall forward the case for trial by the judge, from whose decision an appeal lies to the Privy-council. Since the date of the act numerous trials (see England, Church of) have taken place, and several clergymen charged with ritualistic practices have been imprisoned (A. Tooth, 1877; Pelham Dale and Enraght, 1880; S. F. Green, 1882; J. C. Cox, 1887; see also Mackonochie). In 1889–90 proceedings were taken in the Archbishop of Canterbury's court against the Bishop of Lincoln. The decision was given in November 1890, and related to nine heads: (1) The mixing of the cup during the service is to be discontinued; (2) but the use of a cup already mixed is not an ecclesiastical offence; (3) the court dismissed the charge as to ablution after service, holding that all the bishop had done was the reverent consumption of what remain of the consecrated elements; (4) as to the eastward position, the court decided that there is liberty as to using the north end of the altar or the north end of the west side; (5) the breaking of the bread must be performed so as to be visible to the people; (6) the singing of the anthem 'O Lamb of God' is not prohibited; (7) candles which are kept lighted throughout the service are not an offence; (8, 9) the sign of the cross must be discontinued both in absolution and in benediction. See the articles Altar, Chasuble, Lights, Vestments, &c.; England (Church of), and Prayer-book; Lee's *Directorium Anglicanum* (1865); and the *Priest's Prayer-book, with a brief Pontifical* (6th ed. 1884).

Rivarol, Antoine, French writer, was born at Bagnols in Langnedoc, 26th June 1753. Though but the son of an innkeeper, when he appeared in Paris in 1780 he laid dubious claim to rank, and soon worked his way by his wit into the best society of the time. Already he had written his treatise, *Sur l'Universalité de la Langue Française* (1784), and paraphrased rather than translated the *Inferno*, when in 1788 he set all Paris laughing at the sarcasms in his *Petit Almanach de nos grands Hommes pour 1788*. At the Revolution he took his place in the royalist ranks, and saved his head by emigrating in June 1792. Supported by royalist pensions, the 'Tacitus of the Revolution,' as Burke styled him in one of the least happy of hyperboles, employed himself fitfully in writing pamphlets and weaving dreams of books to be written, in Brussels, London, Hamburg, and Berlin. He had married an English wife, but she quarrelled with him, and not without reason. Rivarol died at Berlin, 13th April 1801.

His works were collected by Chênedollé and Fayolle (5 vols. 1805), but their terse epigrammatic quality shows better by compression in the *Esprit de Rivarol* (2 vols. 1808) and the *Œuvres Choisies*, edited by Lescure (1862; new ed. 1880). See Lescure's *Rivarol et la Société Française pendant la Révolution et l'Émigration* (1883).

Rivas, a decayed town of Nicaragua (q.v.), 6 miles from Lake Nicaragua. Pop. 8000. The fertile department of Rivas, between the lake and the Pacific Ocean, has an area of 1080 sq. m. and a pop. of some 25,000.

Rivaulx Abbey. See Rievaulx.

Rive-de-Gier, a town of France (dept. Loire), stands on the Gier, in the middle of the best coal-field in France, 13 miles NE. of St Etienne by rail. It was formerly a stronghold, surrounded by high walls, and defended by a castle. In 1815 it had less than 4000 inhabitants; in 1891, 13,070. Around the town there are about fifty coal-mines in operation, and in it and close to it several silk-mills,

glass-works, factories for steam-engines and other machinery, and iron and steel factories.

River. Water falling on the land in the form of rain, or resulting from melting snow, or rising to the surface in springs, flows over the surface to a lower level. Where two slopes of land dip together the surface drainage collects to form a stream, and when evaporation is not very rapid several such streams ultimately unite and the volume of water they carry flows to the sea or to a salt lake. Small streams are termed runnels, rivulets, rills, brooks, becks, or burns; large streams are termed rivers, but the word has no precise reference to the magnitude of the stream to which it is applied. Dr Johnson gives as definitions: 'Brook, a running water less than a river;' and 'River, a land current of water bigger than a brook,' and this fairly illustrates the use of the words as popularly applied.

The beginning of a stream—whether brook or river—is called its source, and may be a spring issuing from underground, a lake or marsh in which rainfall accumulates, melting snow, or simply the gathering tricklings from falling rain. The path of a stream is its course, and is the line of lowest level from the source to the end, which if occurring in a lake or the sea is termed its mouth. The connected streams which unite in one river form a river-system. The series of convergent slopes down which a river-system flows—the land which it drains—forms its basin or catchment area, and the name watershed is also sometimes erroneously applied to it. The names watershed, water-parting, and divide are used to designate the boundary line separating adjacent basins. A watershed is always the meeting-place of the highest part of divergent slopes, and from the characteristic form of continents the main watershed of a continent is almost always the crest of a range of mountains. In many cases, however, the diverging slopes meet in a low plain the summit of which may be occupied by a great marsh whence rivers creep away in opposite directions. The basins of all the rivers draining into the same ocean are called collectively the drainage area of that ocean. The main river to which the others are said to be tributary gives its name to the whole river-system. It is often difficult to decide which of several converging streams is entitled to carry the name of the main river to its source. Some geographers give this distinction to the longest, others to that with the highest source, and others to that with the most direct course. This diversity of opinion is increased when the name of a river leaving a large lake is given to one of several nearly equal streams which enter it. Hence it is that different computers disagree as to the length of rivers. The course of a typical river has been divided into three parts, although these are not represented in all cases. The *torrential* or mountain track is the steepest, its gradient usually exceeding 50 feet in a mile, and the velocity of its current being very great. The *valley* or middle track has a gradient which is rarely greater than 10 feet and often less than 2 feet in a mile. The *plain* track nearest the mouth of a river has a gradient of only a few inches in a mile. Rivers such as the Amazon, Mississippi, Ganges, Volga, and the long rivers of Siberia, in which the plain track is of very great length, are the most valuable for navigation, the limit of easy navigability being a gradient of about 1 foot in a mile.

The velocity of a river is proportional to the slope of the bed, but it also bears a relation to the depth of the channel and the volume of water flowing in it. On account of friction on the bottom and sides of the channel retarding the stream, the water flows fastest on the surface and in the middle. The carrying power of a river for suspended solid particles and for stones and gravel pushed along the bed depends on the velocity alone. The following table shows how rapidly the carrying power falls off as the velocity diminishes.

0·170	mile	per	hour	will just begin to work on fine clay.
0·340	"	"	"	lift fine sand.
0·454	"	"	"	lift sand as coarse as linseed.
0·682	"	"	"	sweep along fine gravel.
1·364	"	"	"	roll along rounded pebbles 1 inch in diameter.
2·045	"	"	"	sweep along slippery angular stones as large as an egg.

Rivers in flood, even in the plain track, sometimes attain a velocity of over 5 miles an hour, and torrents may even flow as fast as 20 miles an hour. The course of a river is gradually carved out and shaped by the flow of the water. The sediment and stones carried along are powerful erosive agents in the torrential and valley tracts, and the character of the valleys or gorges produced depends largely on the geological structure of the region. The course of a river is frequently determined by lines of faults, but perhaps more often it appears to be independent of the nature of the strata. Some great rivers, notably the Volga, press against the right bank, cutting it into a steep cliff, while the left bank is left as a very gentle slope. This is explained by the directive influence of the earth's rotation (see EARTH, Vol. IV. p. 165).

Rivers are of very great importance as agents of change in dynamic geology, the form of valley they excavate being determined partly by the nature of the rocks, partly by the climate. In rainless or arid regions steep-walled Cañons (q.v.) are cut to a great depth across high plateaus; in rainy regions subaerial denudation leads to the formation of wide valleys of much gentler slopes. Bars of more durable rock crossing the course of a stream lead to the formation of Waterfalls (q.v.) or rapids from the rapid erosion of the softer strata below. The river above the obstruction is reduced to what is termed the base-level of erosion; the velocity of the current is checked, and wide alluvial deposits are laid down on either side. In course of time the bar of hard rock is completely cut through by a gorge, and the gradient of the stream is ultimately rendered uniform. In this way the common features of gorge and meadow are produced again and again along the course of a stream. The deposits of alluvium form terraces along the valley track of a river, and as the stream cuts its channel deeper they are left at various heights as monuments of its erosive power. When a river is fairly established in its valley it is, geologically speaking, a more permanent feature than lakes or mountains. Upheaval, which acts very slowly, may even elevate a range of mountains across its course, yet all the while the river, cutting its way downward, remains at the same absolute level. The Uintah Mountains, as they were upheaved, were divided in this way by the Green River, the chief tributary of the Colorado. In limestone regions the solvent power of river-water on carbonate of lime leads to the formation of Caves (q.v.) and underground rivers, which as a rule emerge from their subterranean channels on lower ground. Sometimes they do not reappear on land, but discharge their fresh water through openings in the bed of the sea. Such submarine river entrances are not uncommon along the shores of the Adriatic, off the coast of Florida, and in other calcareous regions. When a river advances along a nearly level plain toward the sea its carrying power falls off; gravel, sand, and finally mud are deposited on its margin, and the stream pursues a peculiar winding course. During a flood the swift and muddy stream rises, overflows its banks, and widens out on the level land. The current is at once checked and a long bar of deposit forms along each

margin. These are increased in height by each successive flood, and, the river-bed being simultaneously silted up, broad muddy rivers like the Mississippi, Po, and Hoang-ho come in time to flow along the top of a gently sloping natural embankment, the sides of which are termed levees in Louisiana. Professor Lapparent, calculating from Dr Murray's data regarding the amount of sediment carried down by rivers, finds that they would suffice to wear the entire surface of the land down to sea-level in four million years. The entrances of rivers into lakes or the sea are usually marked by great banks of deposit (see DELTA), or by bars of gravel or sand. In some cases, however, such as the River Plate, the Thames, and Tay, the mixture of river and sea water is gradual, and the sandbanks are spread over a very large area, but not built up into a delta at any one place. Professor Osborne Reynolds has shown, by a remarkable series of experiments, that the form of the sandbanks is due to the outline of the coasts of the estuary and to the tides. In a few instances, such as the Forth, rivers enter deep arms of the sea in which neither banks nor bars are formed. The Congo sweeps directly into the ocean, throwing down great banks of deposit along the continental slope to right and left, but leaving a deep cañon-like gully for the bed of the stream itself; a similar condition occurs where the Rhone enters the Lake of Geneva.

The ultimate source of all rivers is the condensation of water-vapour from the atmosphere in the form of rain, snow, and even dew. If the land were composed of impermeable rocks all the rain-water not lost by evaporation would run off directly over the surface, and rivers would only flow during and immediately after showers. A large part of the rainfall, however, soaks into the soil, which retains it as in a sponge, especially if the land be marshy, and allows it to flow off gradually as superficial springs. Some also percolates deeply into the rocks, ultimately emerging as deep-seated springs at a great distance. The indirect and permanent supply of water to rivers by springs and by the outflow of lakes is independent of local rainfall at the time, and serves to maintain the volume of the river at a certain minimum during the dry seasons. When a river flows toward a region of great evaporation and small rainfall, such as exists in the interior of each of the great continents, evaporation removes more water than is supplied by the remote tributaries, and the stream may fail to fill the hollow it enters, and therefore cannot overflow into the sea. This is the case with the Oxus entering the Aral Sea, and the Volga entering the Caspian. It may be that evaporation is so far in excess of contributions from distant rainfall or snow-melting that the river dries up as it flows, and its last remnant is absorbed in the desert sand. This is the fate of the Murghab, the Heri-rud, the Zerafshan, and many other rivers of central Asia.

Contrasted with these cases are those in which the periodical or occasional increments of direct inflow increase the volume so much as to cause a great rise of level or even extensive inundations. The annual inundations of the Nile are due to the monsoon rainfall on the great mountains of Abyssinia, which increases the discharge at Assouan to fifteen times the amount of the river at its lowest. The Orinoco is another instance of seasonal rains producing tremendous inundations, over 40,000 square miles of the Llanos being said to be laid under water by the summer rains. The Amazon is an instance of a river which is always more or less in flood as the various tributaries attain their greatest height at different seasons. In June, when the highest level occurs in the main river, 20 or 30 miles of forest on each side of its banks are laid under water for hundreds of miles. The Ganges overflows its banks in summer when the monsoon rainfall is reinforced by the melting of snow on the Himalayas. Where the seasons of maximum rainfall and of snow-melting are different, as in the Mississippi, the Tigris, and Euphrates, there are two regular floods in the year.

The danger of flooded rivers arises from the suddenness with which the water rises and overflows narrow valleys or even plains. Frightful devastation follows the bursting of glacier obstruction lakes in mountain-valleys (see LAKE). The great rivers of Siberia remain frozen at their mouths long after the ice and snow have been melted in the interior, and broad strips on their margins are necessarily laid under water by the natural outflow being stopped. The most serious floods in the Danube and Theiss have resulted from the constriction of the channel at the Iron Gates, which prevents the flood water from passing away as rapidly as it comes down; the current of the Theiss is sometimes reversed for many miles. The widening of the channel has been repeatedly attempted as a remedy by increasing the outlet; and an elaborate system for regulating the river here, to be completed in 1895, was begun in 1890. In other cases, such as the tributaries of the Loire, and the southern rivers of the Argentine Republic, the melting snow swells the torrential track, and, on account of the abrupt change of level and the flatness of the plain, the lower part of the rivers cannot carry away the immense volume of water rapidly enough, and floods result. In some instances torrential rivers have been successfully diverted into lakes, which regulate their outflow, preventing either dangerously high or extremely low water. Great rivers which have embanked their course above the level of the plain are the most dangerous of all when flooded. The damage caused by the bursting of the levees on the lower Mississippi necessitates a great expenditure in strengthening the embankments, and the most disastrous inundations recorded in history have followed the bursting of the banks of the Hoang-ho (q.v.) and its consequent changes of course.

River-water is spoken of as fresh, but it always contains a certain amount of solid matter in solution, varying from two grains in the gallon or less in rivers draining hard crystalline rocks to fifty grains in the gallon or more in limestone districts. The nature of the salts dissolved naturally differs according to the geological character of the country traversed, but all samples of river-water differ from sea-water in containing a much smaller proportion of chlorides, and a very much larger proportion of carbonates and of silica.

The temperature of rivers as a rule follows that of the air, but is subject to variations on account of the effect of rain. During sudden floods in summer the temperature of the water may fall many degrees in a few hours as the melted snow or hail precipitated on the lofty mountains is carried toward the sea.

The great rivers of Europe and Asia, such as the Rhine, Danube, Volga, Indus, Ganges, Brahmaputra, Yang-tsze-kiang, afford access to the sea to enormous populations. The Amazon, with its plain track extending for nearly 3000 miles, is in many ways less like a river than a fresh inland sea; but the Mississippi and St Lawrence, although less extensive, are of greater value for carrying sea traffic to inland places. In their torrential and upper valley tracks rivers are of use chiefly for transporting timber and driving machinery. It is interesting to note that in Switzerland, Norway, and Sweden, where there is no coal, there exist exceptional facilities for the use of water-power on

account of numerous mountain-torrents. In hot countries rivers are of the utmost service in irrigating agricultural land; the Zerafshan and Murghab are entirely consumed in that service, and since the completion in 1890 of the barrage on the Nile no water escapes to the Mediterranean in the low Nile months except along irrigation canals.

THE LARGEST RIVER-SYSTEMS.

River.	Area of Basin, sq. m.	Length, miles.	Annual Rainfall of Basin, cu. miles.	Mean Annual Discharge, cu. miles.
Amazon	2,230,000	3400	2834	528·0
Congo	1,540,000	2600	1213	419·0
Nile	1,290,000	3700	892	24·3
Mississippi	1,290,000	4100	673	126·0
Niger	1,060,000	2600	..	..
Ob	1,190,000	3200	..	..
La Plata	995,000	2300	905	189·0
Lena	942,000	2900	..	..
Yenisei	880,000	3200	..	..
Yang-tsze-kiang	689,000	3200	409	125·0
Mackenzie	607,000	2300	..	..
Volga	592,000	2200	152	43·7
Ganges and Brahmaputra	588,000	1800	549	43·3
Zambesi	570,000	1600	..	..
St Lawrence	565,000	2400	339	87·3
Winnipeg-Nelson	504,000	1500	..	..
Yukon	433,000	2200	..	..
Orinoco	430,000	1400	603	122·2
Amur	403,000	2800	..	..
Hoang-ho	387,000	2500	118	23·6
Indus	360,000	1900	104	26·0
Danube	320,000	1700	199	67·5
Murray	300,000	1500	..	..

The statistics of this table, in which account is taken of rainfall and discharge, are taken from Dr John Murray's paper in *Scot. Geog. Mag.* iii. (1887) p. 65. The lengths in all cases and the areas of basins in those for which no rainfall statistics are available are according to the statistical tables in Justus Perthes' *Taschen-Atlas.*

Rivers in Law.—A distinction is made between public navigable rivers and private fresh-water rivers. Where the tide ebbs and flows, the ownership of the bed is in the crown for behoof of the public, and, consequently, the crown is entitled to deepen the channel or perform any other operation on the *alveus* that may improve the navigation. The banks, however, beyond the foreshore are the private property of the riparian owner. It is settled in England—and an opinion to the same effect has been delivered in Scotland—that the public have no common law right to set up even a towing-path along the bank of a navigable river; but, of course, such a privilege of roadway along a public waterway may be established by prescriptive possession. Above the flow and reflow of the tide all rivers and streams are *primâ facie* private, although, either by immemorial uses or by act of parliament, many have become subject to public rights of navigation. In the case of private rivers the *alveus* belongs to the proprietor through whose ground the river runs; or, if the river separates the lands of two owners, each is owner of the soil of the bed to the middle of the stream. The waters of a stream passing through or between the lands of different proprietors may be subject to two kinds of rights, natural and acquired. Natural or proprietary rights are those possessed by every riparian proprietor; they consist principally of a right to a reasonable use of the water, while it is flowing past his land, and a right to have the water flow in its accustomed manner, without sensible disturbance or diminution by the superior or inferior riparian proprietors. Thus, although each proprietor may employ the water while it is within his own grounds, he must allow it to pass onwards to the inferior proprietors in its original channel, and cannot alter its level, either where it enters or leaves his property. The riparian proprietor, either in a public or private river, may protect his side of the stream by embankments; but such embankment must be constructed only for defence, and not in such a manner as to throw the force of the current upon the opposite bank. Acquired rights, on the other hand, are those easements which entitle a riparian proprietor to interfere with a natural stream of water to an extent not justified by his natural or proprietary rights—by diminishing or obstructing the flow of water, by polluting it, &c. Such acquired rights in respect of water may exist in the inhabitants of a district by virtue of immemorial custom, and, both as to kind and extent, are regulated wholly by prescriptive use.

The pollution of rivers has of late years, in consequence of the extension of manufactures, caused serious concern. No person has a right to poison or pollute a stream, and if he do so any of the persons whose lands abut on the stream lower down may bring an action to recover damages. While, however, this right to object to an existing nuisance may be excluded by acquiescence or by prescription, it is so excluded only to the extent of the actual use or possession, and any material increase of the pollution or annoyance may be challenged and interdicted by the injured parties. At common law, indeed, in every question of river-pollution, the real question of fact is whether there has been any material increase of pollution beyond that which is natural to the particular stream, or beyond that which has existed there for the prescriptive period. Questions of river-pollution are eminently fitted for submission to a jury, and are generally disposed of in that way. The whole circumstances must be considered; for example, the size and character of the stream, the uses to which it can be and is applied, the nature and importance of the use claimed and exercised by one party, as well as the inconvenience or injury to the other party. In England, where the pollution of a stream amounts to a public nuisance, the party causing it may be prosecuted by indictment, or proceeded against by information at the suit of the Attorney-general. All the chief modern sanitary acts have provisions regarding the pollution of water; but most of them are local or deal with the pollution of water used for special purposes. In 1868 a Royal Commission was appointed to consider the question of river-pollution, and its recommendations were followed in 1876 by the Rivers Pollution Act (39 and 40 Vict. chap. 75), which is applicable to both Scotland and England. See Higgins, *On the Obstruction and Pollution of Water-courses* (1877).—For fishing rights, see SALMON, and TROUT.

In the United States the common law of England was at first followed; but in some of the states it is expressly declared that the common law is inapplicable. Mining rights have been specially determined in some districts; and the laws as to irrigation rights have been elaborately defined in Colorado and elsewhere.

Rivera, a department in the north-east of Uruguay, separated by a mountain-chain from Brazil. Area, 3790 sq. m.; pop. 17,087.

Riverina, a name given to the extensive grazing districts in the western part of New South Wales, Australia.

Rivers, RICHARD WOODVILLE, or WIDVILE, EARL, was esquire to Henry V., and during his son's reign was made Governor of the Tower (1424) and knighted (1425). He fought in France and in England, in the Wars of the Roses for the Lancastrians. He took to wife Jaquetta of Luxembourg, widow of the Duke of Bedford, and it was their daughter Elizabeth whom Edward IV. married. This led Sir Richard Woodville to change over to the Yorkist side, and his royal father-in-law made him successively Constable of England, Baron Rivers (1448), and Earl Rivers (1466). But the favour shown to the Rivers family offended

the old nobility, and their avarice aroused the enmity of the people. In 1469 Earl Rivers was seized and beheaded at Northampton, but accounts differ as to who were his executioners—whether Robin of Redesdale or the officers of the Duke of Clarence and the Earl of Warwick.—His son ANTHONY, known as Lord Scales during the father's lifetime, succeeded to the earldom in 1469. He stuck closely to his royal brother-in-law, who made him captain-general of the forces. After Edward's death he acted on the council of regency for his infant son, but was seized by order of Richard, Duke of Gloucester, and put to death at Pontefract in 1483.

Rivet, a metal pin for connecting two plates of metal or other material together. The rivet is put through holes in both plates, and the projecting ends are then beaten down so as to represent the head of a nail on each side, and thus hold the plates in close contact. Rivets are of most essential importance in boiler and tank making, and in building iron ships. They are usually put through the holes and beaten down while red-hot, in order that the contraction of the rivet, as it cools, may produce more intimate contact of the plates. Both steam and hydraulic riveting-machines have been in use for a good many years.

Riviera ('seashore'), a term applied to the narrow strip of coast-land bordering the Gulf of Genoa, strictly from Nice to Spezzia, but generally understood to include the whole coast of the department of the Alpes Maritimes, and the Italian coast as far as Leghorn. West of Genoa it is called the Riviera di Ponente, or western coast, and beyond Genoa the Riviera di Levante, or eastern coast. From Hyères to Genoa is 203 miles; from Genoa to Leghorn, 112; sheltered on the north by mountains, the district enjoys an exceptionally favoured climate, no other region north of Palermo and Valencia being so mild in winter. The western section is the mildest and most frequented. It abounds in the most striking and beautiful scenery, and is planted with numerous health and fashion resorts—Nice, Monaco, Mentone, Ventimiglia, San Remo, Bordighera, &c.; and west of Nice are Hyères, Fréjus, Cannes, Grasse, Antibes. The various sections of the coast of 'La Provence Maritime' have each certain distinctive peculiarities, but none of them are entirely exempt from occasional cold winds. The Saracens held posts on this coast, and levied blackmail for centuries. The famous *Corniche* (Ital. *Cornice*) road leads along the coast from Nice to Genoa.

There are guide-books by Baedeker, Murray, C. B. Black, Dr Hugh Macmillan, and Miss Dempster, *Maritime Alps* (1884); A. J. C. Hare's *The Rivieras* (1897); Spark's *The Riviera* (1880), and works cited at the article HEALTH-RESORTS; and especially *The Riviera, Ancient and Modern*, by Ch. Lentheric, an invaluable and standard work (trans. by C. West, 1895).

Rivière, BRITON, was born in London, August 14, 1840, son of a drawing-master at Cheltenham College, and afterwards at Oxford. His ancestors were French Huguenot refugees. He studied at Cheltenham College, and at Oxford, where he graduated B.A. in 1867. He had exhibited at the Royal Academy as early as 1858, and again in 1864, but from the appearance of 'The Poacher's Nurse' in 1866 he has been continuously represented by a succession of pictures, which have grown in vigour and impressiveness, in dramatic power, in humour, in pathos, no less than in mastery of technique. No painter of his time approaches him in his treatment of wild animals, and many of his masterpieces in this kind have reached the widest popularity through engravings. He was made A.R.A. in 1878, R.A. in 1881. Of his numerous works we may here merely name 'Daniel in the Lions' Den,' 'Persepolis,' 'A Roman Holiday,' 'Giants at Play,' 'Actæon,' 'Væ Victis,' 'Rizpah,' and 'A Mighty Hunter before the Lord.' See Armstrong in *Art Journal Annual* (1891).

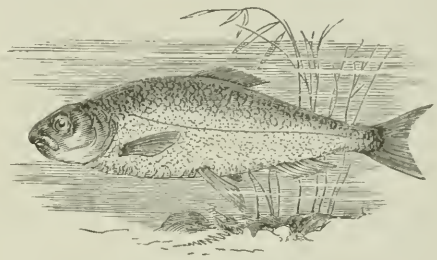
Rivingtons. See LONGMANS.

Ri'voli, a town of Northern Italy, 8 miles W. of Turin, with two royal castles and some industry. Pop. 5314. It was not near this place, but near Rivoli, 12 miles NW. of Verona, that Napoleon won on 14th and 15th January 1797 one of his most decisive victories over the Austrians.

Rizeh, a town of Asia Minor, on the coast of the Black Sea, 40 miles E. from Trebizond, manufactures linen and copper utensils. Pop. 30,000.

Rizzio. See MARY QUEEN OF SCOTS.

Roach (*Leuciscus rutilus*), a fish of the family Cyprinidæ, abundant in England, the south of Scotland, and many countries of Europe. It measures from 10 to 15 inches; the body generally has a silvery appearance, the back is a dull green, the lower fins are red, and there are no barbels. The roach is gregarious in habit, and large shoals are



Roach (*Leuciscus rutilus*).

found usually in lakes, but towards the breeding season they migrate up streams and rivers to spawn. Even at best it is not highly esteemed for food, its flesh, like that of all the Cyprinidæ, being soft and flavourless.

Roads. Roads form a primary element in the material advancement of a nation, being essential to the development of the natural resources of the country. Canals and railways have no doubt, in modern times, superseded to some extent the common highways; still these retain their importance, were it only as essential auxiliaries.

The Romans were great constructers of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except where some natural barrier made it impossible, the Roman roads were almost invariably in a straight line; probably because the chief means of transport then in use were beasts of burden, and not wheeled vehicles, which made the preservation of the level of less consequence. The substantial character of the Roman roads is well demonstrated by the fact that they have in some instances borne the traffic of 2000 years without material injury. The plan of construction was pretty uniform, being that described in the article on the APPIAN WAY, one of the earliest and most famous of them; another was the Flaminian Way (q.v.). They varied in breadth from 15 to 8 feet, and had often raised footpaths at the side, and blocks of stone at intervals, to enable travellers to mount on horseback (see also PAVEMENT). The Roman empire was ultimately intersected by roads—not merely Italy, Spain, Gaul, Illyricum, Macedonia, Thrace, &c., but even in Egypt. In Britain the main lines of Roman roads were four; Elton (in his *Origins*

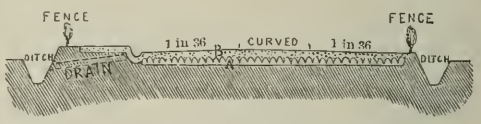
of English History) gives them as follows: 'The Watling Street represents the old zigzag route from Kent to Chester and York, and northwards in two branches to Carlisle and the neighbourhood of Newcastle. The Fosse Way ran diagonally through Bath to Lincoln. The Ermin Street led direct from London to Lincoln, with a branch to Doncaster and York; and the obscure Ikenild Street curved inland from Norwich to Dunstable, and was carried eventually to the coast at Southampton.' Watling Street and Ikenild or Icknield Street have separate articles in this work.

The roads made by the Romans in Great Britain gradually fell into decay, and the attempts that were now and then made to repair them were insufficient to prevent England falling into a worse state with respect to its highways than most other European countries. In 1285 one of the earliest laws on the subject of roads was passed. It directed that all trees and shrubs be cut down to the distance of 200 feet on either side of roads between market-towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III. in 1346, on roads which now form part of the streets of London. In 1555 an act was passed requiring each parish to elect two surveyors of highways to keep them in repair by compulsory labour; at a later period, in place of the compulsory labour, the 'statute labour-tax' was substituted. But long after this the roads even in the neighbourhood of London were wretchedly bad, and in the other parts of the country they were still worse. For the most part, indeed, they were mere horse-tracks; the chief advantage in following them being that they led along the higher grounds, and so avoided bogs. These trackways were usually impassable in winter, being narrow, and in many places so deep and miry as to be liker ditches than roads. So late as 1736 the roads in the neighbourhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St James's Palace in less than two hours, and sometimes stuck in the mud altogether. Much curious information on the state of the roads and means of conveyance in England during the long period which elapsed from the decay of the Roman roads to the middle of the 18th century, will be found in vol. i. of Smiles's *Lives of Engineers*. The Highlands of Scotland were opened up by the roads made by General Wade about 1725.

In laying out a new line of road the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking, and to do so without deviating much from the direct course between the fixed points through which the road must pass. To succeed well in this an accurate survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which require the greatest engineering skill.

The importance of easy gradients or inclinations in roads is well understood in a general way; but it gives a more precise idea of it to state that, while, for example, the traction force requisite to draw a wagon weighing 6 tons along a level macadamised road is 264 lb., on a road of the same kind with an ascent of 1 in 50 the traction force is just double, or 533 lb., the speed of the wagon being 3 miles an hour. Compared with this, a stage-coach travelling on the level at the rate of 6 miles an hour, and weighing 3 tons, requires a traction force of 362 lb.; but the resistance on a hilly road is less unfavourable to the coach than to the wagon, because with an incline of 1 in 70 the forces necessary to draw the two vehicles are about equal, and the force is proportionally greater for the wagon as the incline increases. Experience seems to show that for a macadamised road the maximum slope should be 1 in 40, although a horse with a moderate load can easily enough trot over a gradient of 1 in 33. On the other hand, as it is not desirable for drainage to have a road perfectly level, the best minimum slope, in a longitudinal direction, has been variously given at from 1 in 80 to 1 in 125. The resistance to moving vehicles is less on paved than on 'metalled' roads; hence the maximum slope of the former should be less than that of the latter, from the greater tendency of a cart or coach to slide down the smoother surface.

What is the best transverse form for a road has been a much-debated question among engineers. It should be higher in the middle than at the sides; but some have thought it should be much higher than others. As a road can be better kept clear of water by a slight inclination in the direction of its length than by any form which can be given to its cross section, it has been found preferable that it should be as nearly flat as possible, because every part of its breadth will then be equally available for traffic; whereas it is almost necessary to keep on the centre of a highly convex road, and consequently wear deep furrows there, by confining the wheels and horses to pretty much the same track. The figure shows a transverse section of a road in the form of a segment of a circle—the most approved form—with only a slight rise in the centre. The slope from the side to the middle should not exceed 1 in 36.



Cross Section of a Road:
A, foundation of rough pavement or concrete; B, broken stones.

As respects the construction of the road itself, the first point to consider is the foundation or sub-road. The majority of roads have no artificial foundation. In such cases the surface on which the road-material is to be laid is generally made as solid as possible by means of efficient drainage, and by rolling and beating wherever there are embankments formed. It is the question whether or not a road should have a foundation of rough pavement below the broken stone covering which is the essential point of difference between the two great rival systems of Telford and Macadam. Telford, who began to construct roads in 1803, considered it of great importance that there should be such a foundation. He made it of stones varying in depth from 9 inches at the centre to 3 inches at the sides of the road, these being set with their broadest edge downwards, and no stone being more than 4 inches broad upon the upper edge; upon these were placed a coating of broken stones not exceeding 6 inches in thickness. The Glasgow and Carlisle and the Holyhead roads are excellent examples of the enduring character of those made on Telford's plan.

Macadam (q.v.) preferred a yielding and soft foundation to one which was rigid and unyielding, so that even on boggy ground, if it were but firm enough to allow of a man walking over it, he considered an artificial bottoming quite unnecessary. His roads were formed entirely of angular pieces of stone of such a size as to pass freely through a ring $2\frac{1}{2}$ inches in diameter. This plan, first put into practice about 1816, has now fewer advocates than Telford's, or than

the one subsequently proposed by Mr Thomas Hughes, where a concrete of gravel and lime is employed for the foundation of the road. But experience has shown that, except in the case of streets with very heavy traffic, Macadam's plan of employing angular pieces of stone is superior to every other as a mere covering for roads, whether they have an artificial foundation or not. So popular at one time was the system of macadamising that expensively paved streets were torn up to be re-formed on the new plan. The advantage of angular pieces of stone is that they dovetail into each other, and do not roll about like gravel.

A few of the best metropolitan roads which are not paved have a Concrete (q.v.) foundation with a layer of broken granite on the top of it. But even for the first-class macadamised roads of London the more general construction is to have a bottom or foundation of 'hard core' laid upon the natural surface levelled to receive it. This is composed of some cheap or waste material which is sufficiently hard and strong, such as fragments and chips of building stone and brick, or pieces of broken-up concrete, the whole layer being a foot thick until it is reduced by heavy rollers to about 9 inches. To fill up the interstices in this bottom, and to form a bed for the 'macadam,' a 5-inch layer of ballast is next put down and also compressed by rolling. The surface layer of the road, consisting of rough broken granite, is then laid down, first one layer 3 inches thick, and then a second layer of the same thickness. Both layers are separately rolled to a combined thickness of 4 inches, sand and water being put on the surface of the upper layer beforehand. The London macadamised roads over which there is a less heavy traffic have a somewhat thinner 'hard core,' covered with 4 inches of broken granite without a ballast layer. Broken flint is sometimes used instead of granite, and these second-class roads are only in some instances rolled. All roads of this nature should, however, be rolled.

In some English counties where flints are abundant the roads are made altogether of this material. Large pieces—say 7 inches or more across—form the bottom or foundation, which is 12 or 13 inches thick, and above this a 6-inch layer of flints, broken to the usual size of 2¼ to 2½ inches across, forms the surface, which is not generally rolled. In some of these country roads broken bricks or other hard waste material are put in as a bottom layer, with broken flints above. Large pieces of flint make an excellent foundation for such roads; but this material is too brittle to form a good surface layer.

The roads in many parts of Scotland and also in some English counties are macadamised with some variety of trap rock, such as basalt or dolerite (see BASALT). These are usually called whinstones, a term also applied to some very hard sedimentary rocks. Most of these form a good road covering. In the granite districts granite is used; Guernsey granite is one of the most durable kinds for heavy traffic. Hard limestone forms a very smooth and pleasant road; but many limestones and most sandstones are too soft for road metal, the stone for which should be tough as well as hard. Greywacke rock is also used.

The construction of paved streets is noticed under PAVEMENT; but we may state here that for heavy traffic the best road or street for a town is that formed of asphalt, 2 inches thick, on a foundation of concrete 6 inches thick. Its qualities of durability and cleanliness outweigh the disadvantage of its slipperiness. See ASPHALT.

It will be apparent from what has been said that drainage is in great part secured by the plan on which a road is made. What further drainage a road requires can in many situations be effected by ditches on either side. Where this is not possible, as in the case of portions situated in cuttings more or less deep, proper drains require to be constructed. In such circumstances a drain is either made down the centre, with branch-drains from the sides running into it; or drains are formed along the sides, with gratings at proper intervals to take in the surface-water.

Cyclists have established a Roads Improvement Association, which seeks to stimulate the local authorities to keep the roads in good repair.

See works on road-making by W. M. Gillespie (new ed. 1871), Codrington (1876), Gilmore (1876), Law and Clark (new ed. 1881), F. W. Simms (new ed. 1884), and Thrupp (1887); also Jusserand's *English Wayfaring Life in the Middle Ages* (Eng. trans. 1888), and W. C. Sydney's *England in the Eighteenth Century* (1891).

Roads in Law.—Roads are included under the general name of highways, a highway being defined as a place over which a right of walking, riding, or driving is enjoyed by the public generally. It is called the King's (or Queen's) highway, because the sovereign is protector of the commerce of his subjects, and as such empowered to make regulations for traffic by sea and land. Highways are of several kinds—footways; foot and horse ways, sometimes called bridle-paths; pack and drift ways, used for driving cattle and pack-horses; foot, horse, and cart ways, over which the public may travel with vehicles of all ordinary descriptions. Navigable rivers are also described as highways. Where a Right of Way (q.v.) belongs not to the public generally, but to the owners or occupiers of land or house property, the way in question is private, not public, and the right to use it is classed among Easements (q.v.). A public way may exist over a place which is not a thoroughfare, as, for example, a street closed at one end. Highways are created by an express or implied grant, whereby the owner of the land dedicates it to the use of the public, by the necessity of things or by act of parliament. If an owner permits the public to pass and repass over his land without interruption, it is presumed that he intends to grant a public right of way; he loses his right to exclude the public, and the way is a highway for ever, unless it should be closed by a public authority under an act of parliament. Public rights may be limited to a particular purpose, as where the inhabitants of a parish have the right to use a way in going to or coming from church. If a highway be out of repair passengers may go over adjacent land; but this is a right to be exercised with caution. Any obstruction placed upon a public way is a Nuisance (q.v.), and may be abated or removed by any person aggrieved. Every part of a highway is equally open to the public; a foot passenger may walk on the carriage-way, and a blind or aged person has as good a legal right to be on the road as any one else. But passengers must use ordinary care to guard themselves against accident, and they must comply with the well-known 'Rules of the Road' (q.v.)—a person driving must keep to the left on meeting another vehicle, and to the right on passing another vehicle; and if he transgresses these rules without justification he will be liable for the consequences. No person is justified in using a highway for any purpose, however useful, which interferes with the general right of the public to pass and repass. Thus it has been held that a local authority cannot lay down tramway lines so constructed as to damage the wheels of carriages using the street, although the tramway might be for the convenience of the public generally. On the same principle it was held an indictable nuisance for a telegraph company to place its posts on a strip of land adjoining the road. Nothing

but an act of parliament can legalise such uses of a public way.

Subject to the rights which he has conferred on the public, the owner retains his right of property in the land. If the land on both sides of a highway belongs to the same owner, it is to be presumed that his rights extend over and under the road; if the land on one side belongs to A and on the other side to B, each is presumed to be owner up to the middle line of the way. If, for example, a mine should be opened in the neighbourhood of the road, the adjoining owner or owners would have the right to mine under it, so long as sufficient support is left for the surface of the road. If a gas or water company without authority of parliament takes up a road to lay its pipes, this is not only a nuisance but a trespass, for which damages may be recovered by the owner of the land. It has been held that a person loitering on a highway for the purpose of poaching may be indicted for trespassing on the land of the adjoining owner.

The repair of a carriage-way involves a regular outlay, and there are some cases in which this burden is imposed upon the owner of the land, *ratione tenuræ*, as a part of the service by which he holds his estate. But the general rule of common law is that the inhabitants of a parish must repair the highways within the same; they are liable to indictment if they fail to perform this duty, and no agreement they can enter into will relieve them of their liability. Many townships, &c., which are not separate poor-law parishes are separate highway parishes by ancient custom. The management of highways separately maintained by the parish was regulated by an act passed in 1835, and amending acts; a parish surveyor was elected by the ratepayers; in parishes over 5000 population a board might be elected. Under an act of 1862 many parishes were grouped in districts. The highway board of a district consisted of waywardens elected for the parishes therein, and of the acting justices who reside in the district. Under the Public Health Act an urban sanitary authority was made the highway authority within its district. Many of the main roads throughout England were constructed or improved under Turnpike trusts, constituted by acts of parliament. Turnpike trusts and highway boards have alike been superseded by the provisions of the Local Government Act of 1878 and subsequent acts. The control of the main roads of a county now rests with the county council, and the burden of their maintenance is a county charge. The rural district councils are the highway authorities for highways other than main roads, and have the powers of the surveyor of highways. In boroughs the powers of the county council are exercised by the corporation. The parish councils take charge of the repair of footpaths. Tolls had been generally abolished before these sweeping changes in road management; see TOLL. Legislation as to road-engines and motor-cars is treated at TRACTION-ENGINES.

In the law of Scotland a highway is said to be *inter regalia;* but it seems that the presumption is that the land over which a road passes belongs to the adjoining owner or owners. Public rights of way are acquired by actual use for the prescriptive period of forty years. There were formerly two classes of roads—statute-labour and turnpike; by the Roads and Bridges Act, 1878, the management of all roads was vested in county road trustees; by the Local Government Act of 1889 the powers of the road trustees were transferred to the county council; in the burghs they are managed by the town council or the commissioners of police.

For an outline of the English law, see Wright and Hobhouse, *Local Government in England;* for the Scotch law, Goudy and Smith, *Local Government.*

Roanne, a town of France (dept. Loire), 52 miles by rail NW. of Lyons, stands on the left bank of the Loire, which becomes navigable here, and is crossed by a stone bridge (1820). The principal church is St Stephen's (15th to 17th century). Roanne has besides an old castle with antiquarian collections, a new hôtel-de-ville with a museum, some manufactures, and a large transit trade, especially in Lyons manufactures, in iron and coal, and oriental wares. Pop. (1872) 18,615; (1891) 30,996.

Roanoke, a river of Virginia and North Carolina, formed by the union, a mile above Clarksville, Virginia, of the Dan and Staunton rivers, which rise in the Alleghanies, flows southeast through the north-eastern portion of North Carolina, and empties into Albemarle Sound. It is navigable for steamboats to Weldon (130 miles); its length is 230 miles.

Roanoke, a city of Virginia, on the Roanoke River, 258 miles by rail W. of Norfolk, at the junction of the Shenandoah Valley and the Norfolk and Western railways. In 1880 it was a secluded hamlet; by 1890 it was grown to a bustling city, with a court-house, opera-house, hotels, churches, gaol, gas and electric lights, large machine-shops, steel and iron works, a rolling-mill, tobacco, spoke, and canning factories, mills, bottle-works, &c. Pop. 16,159.

Roaring, popularly known as a disease, is only a symptom of disease in horses. It consists in a more or less loud unnatural sound emitted during the act of inspiration. As a rule it is first manifested by an animal making a slight noise, but this slowly increases in loudness and intensity, and in many cases the animal becomes useless whilst still comparatively young. Whistling is a modification of roaring, and is due to similar causes. The disease is found to be due, in the great majority of cases, to a wasting, atrophy, and fatty degeneration of the muscles of the larynx, but more particularly of those of the left side. This is partly at least explained by the fact that the nerve supplying the motor power to the left side is given off deep within the chest, winding round the posterior aorta, whereas that on the right is given off opposite the first rib, just at the entrance into the chest, and that the left nerve is more apt to be implicated in diseases of the organs within the chest. Still this theory is not quite satisfactory, as the same anatomical arrangement is found in other animals, yet roaring from muscular atrophy is not known among them, and many 'roarers' whose history has been known from birth have never suffered from chest affections, whilst others severely affected with chest disease have not become roarers. Again, mares and ponies are not nearly so prone to become roarers as males and larger horses.

The development of roaring is often due to catarrh, strangles, or some other disease affecting the respiratory organs; but it is generally concluded that these diseases are not sufficient of themselves to cause it, provided there be no hereditary taint, this hereditary taint alone being sufficient in many instances to induce roaring without the advent of another disease. There is no cure for it, all attempts made in this direction having hitherto proved abortive. In 1887 an operation for the cure of roaring was reintroduced by Dr Fleming, then principal veterinary surgeon to Her Majesty's forces. Similar operations had been performed by Günther, in Hanover, so far back as 1834. It consists in making a long incision into the larynx, the animal being under chloroform, and removing the arytenoid cartilage and vocal chord of the paralysed side. Some horses were slightly benefited, but many became worse than before the

operation, and had to be destroyed. This proved a great disappointment to the veterinary profession, as hopes had been held out that at last a cure for roaring had been discovered.

Roaring is now included by the Royal Agricultural Society of England among the hereditary unsoundnesses, and their veterinary officers are instructed to disqualify all horses exhibited at the great national show that give any signs of this grave hereditary disease. See works by George Fleming (1889) and T. J. Cadiot (trans. 1893).

Roaring Forties, a sailor's term for a region of the great Southern Ocean lying south of 40° S. lat. (especially south of 45°), where the prevailing winds are strong WNW. and NW. winds, often stormy. It is owing to these winds that the outward voyage to Australia is made by the Cape, and the homeward voyage by Cape Horn. The same name is sometimes given by analogy to a belt of the North Atlantic about 40°–50° N.

Robben Island (Dutch, 'seal island'), an islet at the entrance of Table Bay, 10 miles NW. of Capetown. It contains a lunatic asylum and a leper colony, the management of which latter institution caused some discussion in 1889 and 1890.

Robber Council. See EUTYCHES.

Robbery is the taking and carrying away, either with violence or with threats of injury, of a thing which is on the body or in the immediate presence of the person from whom it is taken, under such circumstances that in the absence of violence or threats the act committed would be a theft. In order to constitute the crime, the robber must actually obtain possession of the goods. Further, it is well established that no sudden snatching of property unawares from a person is sufficient to constitute robbery, unless some injury be done to the person, or there be a previous struggle for the possession of the property, or some force used to obtain it. By statutory law in England and Ireland (24 and 25 Vict. chap. 96) the punishment for robbery is imprisonment or penal servitude, varying according to the nature of the violence or threats used. By the Criminal Procedure (Scotland) Act, 1887 (50 and 51 Vict. chap. 35), the jurisdiction of sheriffs has been extended to robbery and certain other crimes which formerly were cognisable only by the Court of Justiciary. It is, however, to be noted that this extension of jurisdiction does not render bailable crimes, such as robbery, which were not formerly bailable. By the above-mentioned statute it is now competent, under an indictment for robbery, to convict of reset or theft, or attempt to rob. An act of robbery committed upon the high seas constitutes the offence of piracy at common law; and each state is entitled to visit the crime with the penalties which its own laws may determine. In England cases of piracy are now tried at the Central Criminal Court and at the assizes.

Robbia, LUCA DELLA, sculptor and modeller of figures in relief, was born at Florence in 1399 or 1400, worked all his life there, and died there on 20th February 1482. He designed and executed between 1431 and 1440 ten panels of Angels and Dancing Boys for the cathedral, which Professor J. H. Middleton calls one of the greatest pieces of sculptured work in the 15th century. Another great work by him was a bronze door, with ten panels of figures in relief, for the sacristy of the cathedral, made between 1448 and 1467. In marble he sculptured, in 1457–58, the tomb of Federighi, Bishop of Fiesole (now in the church of San Francesco outside the city). The frame that surrounds this monument is made of exquisitely painted majolica tiles. His name is closely associated with the production of figures in glazed or enamelled terra-cotta, made by a process which, though he did not invent it, he yet perfected greatly. Amongst the works he executed by this process are numerous medallions, some white, some polychrome, and reliefs.—His principal pupil was his nephew ANDREA (1435–1525), who worked chiefly at the production of enamelled reliefs, retables, and medallions, these last for the most part reproductions of the Madonna and Child. Nearly all his works were of religious subjects; they were made chiefly for Florence, Arezzo, and Prato.—His son GIOVANNI (1469–1529?) continued the activity of the family in this style of work; his best productions are the frieze, representing the Seven Works of Mercy, outside a hospital at Pistoja, and a fountain in the sacristy of St Maria Novella in Florence.

See Cavallucci and Molinier, *Les Della Robbia, leur Vie et leur Œuvre* (1884); Leader Scott, *Luca della Robbia* (in the 'Great Artists' series, 1883—to be used with caution); and M. Reymond, *Les Della Robbia* (Florence, 1897).

Robert I. (OF SCOTLAND). See BRUCE.

Robert II., king of Scotland 1371–90, was born 2d March 1316, two years after the battle of Bannockburn. His father was Walter Stewart (q.v.), his mother Marjory, only daughter of Robert the Bruce; and both parents he lost in infancy. Throughout the disastrous reign of his uncle, David II., he was one of the most prominent of the patriotic nobles of Scotland, twice acting as regent during his exile and captivity, and fighting at Halidon Hill (1333) and Neville's Cross (1346). On David's death (22d February 1371) he obtained the crown, and became the founder of the Stewart dynasty, in virtue of the law of succession settled by the Council of Estates at Ayr in 1315. 'A man not valiant,' Froissart describes him, 'with red blear eyes, who would rather lie still than ride;' and partly from disposition, partly from the infirmities of age, Robert proved a peaceable, if not exactly a pusillanimous ruler. Such wars as were waged with England were not only conducted, but organised, by his powerful and intractable barons, particularly the Earls of Douglas, Mar, March, and Moray, who shaped the policy of the country very much according to their pleasure. The misery inflicted on both sides of the Border by the raids of these warlike chiefs, and the reprisals of the English wardens—the Percies and others—were frightful; famine and pestilence became chronic; but the most celebrated incidents of Robert's reign were the invasions of Scotland by an English military and naval force under the command of the Duke of Lancaster ('old John of Gaunt, time-honoured Lancaster') in 1384, and again by King Richard II. himself in 1385, which wasted the land as far as Edinburgh and Fife, and the grand retaliatory expedition of the Scotch in 1388, which culminated in the battle of Otterburn (q.v.). Robert died at his castle of Dundonald in Ayrshire, 19th April 1390. He married first, in 1349, his mistress, Elizabeth Mure of Rowallan, and secondly, in 1355, Euphemia, daughter of the Earl of Ross and widow of the Earl of Moray.

Robert III., king of Scotland 1390–1406, son of the preceding, was born about 1340. His baptismal name was John, but this name, out of hatred to the memory of John Baliol, was changed on his accession to the throne by an act of the Scottish Estates. His imbecility as a ruler virtually placed the reins of government in the hands of his ambitious brother, Robert, Earl of Menteith and Fife, in 1398 created Duke of Albany, during whose regime the Scottish barons first began to exercise that anarchic and disloyal authority which, in the reigns of the first three Jameses, threatened to destroy the power of the sove-

reign altogether. The principal events in Robert's reign were the invasion of Scotland in 1400 by Henry IV. of England, who, at the head of a large army, penetrated as far as Edinburgh, but did not inflict much injury on the country—more, however, from clemency than impotence—and the retaliatory expedition of the Scotch, two years after, under Archibald Douglas, which resulted in the terrible disaster at Homildon Hill (q.v.). Robert had two sons, the eldest of whom was David, Duke of Rothesay (1378-1402), a youth not destitute of parts, but shockingly licentious. As long as his mother lived he kept within bounds, comparatively speaking; but after her death, says Buchanan, 'he gave an unbridled license to his passions; laying aside fear and shame, he not only seduced married ladies and virgins of good family, but those whom he could not entice he forced to his embraces.' Albany received orders from the king to act as his guardian, and after a short time starved him to death at Falkland; for which he underwent a mock-trial by his own creatures, and was of course declared innocent. Robert now became anxious for the safety of his younger son, James, and, after consulting with Archbishop Wardlaw of St Andrews, he resolved to send him to France; but, while proceeding thither, the vessel in which he sailed was intercepted by an English cruiser, and James was taken prisoner (1405). When his father received the melancholy news he gave way to paroxysms of grief, and died at Rothesay Castle, 4th April 1406.

Robert of Brunne. See BRUNNE.

Robert of Gloucester. See GLOUCESTER.

Roberts, DAVID, landscape and architectural painter, was born at Edinburgh (in Stockbridge) on 24th October 1796, and was apprenticed to a house-painter. In 1818 he advanced to the grade of scene-painter, and in 1821 went to London to paint scenery for the stage of Drury Lane. All this while he was studying artistic drawing and painting, and in 1826 and 1827 he attracted the attention of the public with pictures of Rouen and Amiens cathedrals in the Royal Academy exhibitions. Then for several years he travelled in Spain, Morocco, Egypt, Palestine, Italy, Belgium, making drawings of grand and impressive buildings and landscapes with picturesque edifices, and working them up into pictures. From among this work the following stand out—the drawings from Spain for the illustrations to the *Landscape Annual* (1835–38); the magnificent volumes of *The Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia* (1842); numerous interiors of churches, as St Miguel at Xeres, Holy Nativity at Bethlehem, St Jean at Caen, St Paul at Antwerp, St Peter's at Rome, the cathedrals of Milan and Seville; and the grandiose pictures, 'Departure of the Israelites from Egypt' (1829), 'Ruins of the Great Temple at Carnac' (1845), 'Jerusalem from the South-east' (1845), 'Destruction of Jerusalem' (1849), 'Rome' (1855), and 'Grand Canal at Venice' (1856). Roberts' style is essentially spectacular, producing grand broad effects, with magnificent architectural arrangements, to which the details are of course generally sacrificed. He was elected an A.R.A. in 1839, an R.A. in 1841; and died 25th November 1864. See Life by James Ballantine (1866).

Roberts, LORD, G.C.B., V.C., G.C.I.E., K.P., K.G., made baron in 1892, earl in 1901, was born at Cawnpore, 30th September 1832, the son of General Sir Abraham Roberts. He was brought to England when two years old, educated at Clifton, Eton, Sandhurst, and Addiscombe, and entered the Bengal Artillery in 1851. His first taste of actual warfare was got in the hot time of the siege of Delhi, during the Mutiny, and he took an active part in the subsequent operations down to the relief of Lucknow, acting on the staff, in the quartermaster-general's department, and he won the V.C. He discharged the duties of assistant quartermaster-general in the Abyssinian expedition of 1868, and in the Lushai expedition of 1871–72. On the outbreak of the Afghan war in 1878, Roberts, now major-general, was appointed to command the Kurram division of the army. He forced in brilliant fashion the Afghan position on the peak of Peiwar Kotul (8500 feet above sea-level), and was rewarded with a knight-commandership of the Bath (1879). After the murder of Sir Louis Cavagnari and the escort of the British mission at Kabul, he was given the command of the force sent to avenge them. He defeated the Afghans at Charásia on 6th October, took possession of Kabul on the 12th, and assumed the government of the country, Yákúb Khan having abdicated. Events followed quickly: the fortified cantonment of Sherpur was occupied by the British army, the fortress of Bala Hissar in Kabul was dismantled, Yákúb Khan was sent a prisoner to India, the Afghans began to concentrate on Kabul, General Roberts sought to check them, and there was much sharp fighting round the city, Abdul Rahman was proclaimed Ameer, and General Burrows was crushingly defeated at Maiwand, and the British garrison of Kandahar besieged by the followers of Ayub Khan. On 9th August Sir F. Roberts set out with 10,148 troops, 8143 native followers, and 11,224 baggage animals on his memorable march through the heart of Afghanistan to the relief of Kandahar, which he reached three weeks later. He immediately gave battle to Ayub Khan, and routed him completely, capturing all his artillery and his camp. When he visited England towards the close of the year he was honoured with a baronetcy, and on his return to India was appointed commander-in-chief of the Madras army (1881), and from 1885 till he resigned the post in 1893, held the rank of commander-in-chief in India. In 1895 he was made Field-marshal Lord Roberts 'of Kandahar and Waterford,' and Commander of the Forces in Ireland; is also G.C.S.I., LL.D. of Cambridge, &c. In December 1899 he was sent to South Africa to take chief command in the Transvaal War, with Lord Kitchener (q.v.) as chief of his staff. Here he had eventually nearly 200,000 men under his command, the largest British army ever engaged in any war. After a brilliant series of engagements (capturing Commandant Cronje and 4000 men) he occupied Bloemfontein and hoisted the British flag in Pretoria (5th June 1900); and the South African Republic and the Orange Free State were proclaimed British colonies. In December 1900, on the practical completion of the war, he returned to England to take the post of commander-in-chief of the forces. See a Life by C. R. Low (1883), but especially Lord Roberts's own brilliantly successful work, *Forty-one Years in India* (1896).

Robertson, FREDERICK WILLIAM, was born, eldest of the seven children of an artillery captain, in London on 3d February 1816, and spent his first five years at Leith Fort. He had his schooling at Beverley, Tours, and Edinburgh Academy; and after a short time of study at Edinburgh University, and a year in a solicitor's office, he returned to his home at Cheltenham to prepare for the army, but was, after much misgiving, persuaded of his vocation to the ministry. He matriculated at Brasenose College, Oxford, in 1837. Here he felt no real affinity with Newmanism, but clung firmly to the Evangelicalism of his upbringing, tempered by a charity and tolerance all his own. He was ordained by the Bishop of Winchester in July 1840, and for nearly a year thereafter held a curacy at Winchester. His health now broke down at once

from over-devotion to work and a course of ascetic austerities through which, in this period of bondage to the letter, a hypersensitive conscience prompted him to seek after a higher level of Christian life. A walking tour on the Continent restored him to health, and at Geneva he married, after a short acquaintance, a daughter of Sir George William Denys. In the summer of 1842 he became curate to the incumbent of Christ Church, Cheltenham, and here for nearly five years he laboured with unbroken devotion, despite depression of spirits, conviction of failure, and a painful and prolonged mental struggle through which he fought his way upwards to certainty in his grasp of the realities of Christian truth. His faith in Evangelicalism was first shaken by the intolerance and bitterness of its partisans, and the spiritual agony of the revulsion shook his soul to its foundations, and again broke down his health. In September 1846 he set out for the Continent, and, after three months of travel and preaching at Heidelberg, returned a follower of no school to accept the curacy of St Ebbe's in Oxford. Here the power of his preaching had already made itself felt among his poor and even among the undergraduates, when in August 1847 he accepted an invitation to Trinity Chapel, Brighton.

He had now grown to his full stature as a disciple of Christ, and his rare union of imaginative with dialectic power, the beauty and freshness of his thought, his earnestness, originality, wide sympathy, and knowledge of the human heart at once arrested public attention. He brought the religion of Jesus to bear on everyday life and the perplexing social problems of the time, and pointed out the path to the true liberty, equality, and fraternity in service and discipleship as sons of God and joint-heirs with Jesus Christ. But his motives were misunderstood by many, and, especially after the excitement of 1848, he was branded for his sympathy with working-men as a revolutionist and enemy of social order, and subjected to much misrepresentation and many a cruel and unjust attack. He established the Working-men's Institute in Brighton, and taught its members how to govern and to respect themselves, and he flung himself with a passionate and chivalrous enthusiasm into every battle waged in his day against tyranny and wrong. Stern in denunciation of moral evil, he was tolerant of intellectual error, and thus his influence, like his Master's, extended to men hitherto outside the pale of Christian sympathy. The strength and absolute sincerity of his convictions, and the broad rationality and certitude on which these were based, gave new strength to many a troubled and doubting heart, and added in almost unexampled degree the seal of power and comprehensiveness to his ministry. To him the Incarnation was the centre of all history; Christ, God's idea of human nature realised. He was no mere negative theologian, for the central point of his preaching was ever the historical reality of the life of Christ, revealing at once sonship with God and brotherhood with man. Men are sons of God by virtue of His image stamped upon them in creation; they become so *de jure* by baptism, but *de facto* by faith. The suffering of Christ makes atonement for our sins by making possible in us the potentiality of sympathetically suffering for others; while faith converts this potentiality into an actual reality, as the foundation of union with God and the spring of Christ-like qualities within us. The characteristic fruit of faith is a pervasive love to Christ and to one another; and one of the privileges that flow from it is an elevation from the bondage of the letter, and a security in the freedom of the spirit. Hence came Robertson's honest refusal to sign the petition for an enactment against opening the Crystal Palace on Sundays—a protest against binding the chains of Judaical legalism on the Christian conscience which cost him much odium and inspired one noble sermon. Robertson grasped the idea of the vast comprehensiveness of the Christian ideal, with its unity of spirit under diversity of form, recognising that theological systems must be continually modified by new conditions of life and thought in the historical development of the ages. The intolerant absolutism of the Evangelical school, and the High Church subservience to form, as well as its search for an ideal in the Christianity of the past rather than in the present or the future, were alike repugnant to him; yet he possessed all the emotional fervour which used to be claimed as the monopoly of the one, and which he loved in his own day to recognise in the fresh enthusiasm of the other, together with the strength of thought and the philosophic breadth usually associated with the more liberal theology. He himself summed up the cardinal principles of his teaching in these propositions: (1) The establishment of positive truth, instead of the negative destruction of error. (2) That truth is made up of two opposite propositions, and not found in a *via media* between the two. (3) That spiritual truth is discerned by the spirit, instead of intellectually in propositions; and therefore Truth should be taught suggestively, not dogmatically. (4) That belief in the human character of Christ's humanity must be antecedent to belief in his divine origin. (5) That Christianity, as its teachers showed, works from the inward to the outward, and not *vice versâ*. (6) The soul of goodness in things evil.

In the pulpit Robertson's voice was low but clear and musical, with occasional startling modulations, and that peculiar thrill of suppressed emotion which is the innermost secret of eloquence. He stood almost motionlessly erect, his fine face, delicate and mobile features, and deep blue eyes all eloquent in harmony with his words. Intensely sensitive as he was, all self-consciousness vanished as he spoke, his brain and heart aglow with a fire of earnestness that burned up his physical strength. His sermons were kneaded with his heart's blood, hence their reality, as he never spoke what had not become a part of himself. In preparing them he jotted down his thoughts on scraps of paper, next wrote out his main ideas with some fullness in logical sequence of thought, then made on a small slip of paper a brief abstract of the whole with merely the heads and a few of the leading thoughts. This he took with him into the pulpit, but hardly had he warmed to his subject ere it was crushed in his grasp and flung aside as useless.

During his last years Robertson suffered intense pain from a disease of the brain, which was heightened by the excitability and unrest of his temperament, and the misrepresentations that fell like blows upon a hypersensitive nervous organisation. He preached his last sermon in Trinity Chapel on 5th June 1853, having resigned because his vicar had refused on entirely inadequate grounds to confirm his nomination of a curate. After a few more weeks of cruel suffering he died, 15th August 1853, with the last words on his lips, 'I must die. Let God do His work.' Eight days later he was laid in the Extra-mural Cemetery at Brighton amid the sorrow of the entire population of the town. Its citizens knew well what Stopford Brooke's biography twelve years later revealed to the wider world, that his whole life had been a passionate Imitation of Christ.

Robertson of Brighton published in his lifetime but one sermon—the four series (1855, 1855, 1857, 1859–63) so well known over the English-speaking world, and constituting so unique a monument of religious genius, were

not written for delivery or preservation, but are really recollections sometimes dictated by the preacher himself to the younger members of a family in which he was interested, sometimes written out by himself for them when they were at a distance. Yet another volume, *The Human Race*, &c., was issued in 1880. Other works that have also been published are *Expository Lectures on St Paul's Epistle to the Corinthians* (1859); *Lectures and Addresses* (1858); *An Analysis of 'In Memoriam'* (1862); a translation from Lessing—*The Education of the Human Race* (1858); and *Notes on Genesis* (1877). The *Life and Letters*—the latter only inferior in value to the sermons—by the Rev. Stopford A. Brooke, appeared in 1865, and has already taken its place among the classics of English biography.

Robertson, Joseph, Scottish antiquary, was born, a small shopkeeper's son, at Aberdeen, 17th May 1810, and was educated at Udny Academy, and the grammar-school and Marischal College of his native city. An Episcopalian and Conservative, he was apprenticed to a lawyer, but took early to writing, and, after six years of literary work at Edinburgh, was a newspaper editor at Aberdeen, Glasgow, and Edinburgh from 1839 to 1853. He was in that year appointed curator of the historical department of the Edinburgh Register House, received in 1864 the degree of LL.D., and died 13th December 1866. He was an originator of the Aberdeen Spalding Club (1839–70), for which he edited four works; and for the first edition of this encyclopædia he wrote eighty articles (Columba, Culdees, Cuthbert, Mary Stuart, &c.), many of which have, with revision, been retained. Of his other works may be noticed *The Book of Bon-Accord, or a Guide to the City of Aberdeen* (1839), *Catalogues of the Jewels, Dresses, Books, and Paintings of Mary Queen of Scots* (Bannatyne Club, 1863), the invaluable *Concilia Scotiæ: Ecclesiæ Scoticanæ Statuta, 1225–1559* (2 vols. Bannatyne Club, 1866), and an admirable article in the *Quarterly Review* for June 1849 on 'Scottish Abbeys and Cathedrals.' See the Memoir prefixed to a reprint of the last (Aberdeen, 1891).

Robertson, Thomas William, dramatist, was born at Newark-on-Trent, on 9th January 1829. The family had for some generations back been actors and actresses, and young Tom was brought up almost on the boards. About the middle of the century the Lincoln circuit, with which his father was connected, ceased to pay; the company was broken up, and Tom proceeded to London. There he struggled for a living, acting as prompter and stage manager, writing unsuccessful plays, acting himself, writing for newspapers and magazines, *Fun* amongst them, translating French plays, and so forth; but Robertson was never an actor of any mark. His first success as a dramatist was with *David Garrick*, in 1864, the title rôle of which was one of Sothern's great things. This was followed by the production of the comedy *Society* at Liverpool (1865), where, and later in London, it was received with the warmest approval. His next comedy, *Ours* (1866), produced by the Bancrofts at the Prince of Wales's Theatre, London, thoroughly established Robertson's fame; and from that time his pen was kept incessantly busy. *Caste* (1867), *Play* (1868), *School* (1869), *M.P.* (1870)—all brought out by the Kendals at the Prince of Wales's—and *Home* (1869) and *Dreams* (1869), the former at the Haymarket, the latter at the Gaiety, were all equally successful. But in the midst of his triumphs Tom Robertson died, in London, on 3d February 1871. His best comedies still retain their popularity, thirty years after they were first produced. This is owing in the first place to the excellence of their construction and stagecraft, and in the next to their bright and merry humour, their wholesome, healthy tone, their happy contrasts, and the sunny spirit that shines through them. See his *Principal Dramatic Works*, with Memoir by his son (2 vols. 1889), and the *Life and Writings*, by Pemberton (1893).

Robertson, William, the historian, was born 19th September 1721, at Borthwick in Midlothian, of which parish his father was minister. He went to school at Dalkeith, at twelve entered the university of Edinburgh, and at twenty-two was ordained as minister of Gladsmuir. On the sudden death of his father and mother soon after, the care of a younger brother and six sisters devolved upon him, and this duty he at once cheerfully undertook, although his income was but £100 a year. At the same time he was assiduous in preaching, in catechising, and in all the duties of his office. His vigour and patriotism he showed by joining a body of volunteers formed for the defence of Edinburgh against the Jacobite rebels in 1745, and after the surrender of the city he offered his services to the royalist commander at Haddington. As early as 1751 we find Robertson taking a prominent part in the debates of the General Assembly, and indeed his influence soon became supreme as leader of the 'Moderate' party in the church. He carried the deposition of Gillespie in the Assembly in 1752, and in 1757 the acquittal of Carlyle of Inveresk before the Synod for having been present at the performance of Home's tragedy of *Douglas* on the Edinburgh stage. From 1759 till his death he was joint-minister with Dr Erskine of Greyfriars Church, Edinburgh, and in the same year he was appointed chaplain of Stirling Castle. Still further, in 1761 he became a royal chaplain, in 1762 principal of the university of Edinburgh, and in 1764 the office of king's historiographer was revived in his favour, with a salary of £200 a year. Tempting offers of golden preferment in the English church were held out to him, but these he was too sensible and honest to accept. All this was because of the splendid and immediate success of his *History of Scotland* (1753–59), which earned the warmest praises from Hume, Horace Walpole, Lord Chesterfield, Bishop Warburton, David Garrick, and Baron d'Holbach, if not Dr Johnson—'Sir, I love Robertson; and I won't talk of his book,' said the doctor to Boswell. Next followed the *History of the Reign of the Emperor Charles V.* (3 vols. 1769), to which was prefixed an admirably synthetic and suggestive *View of the State of Society in Europe from the subversion of the Roman Empire to the beginning of the Sixteenth Century.* This is the most valuable of Robertson's works. The field has been often since traversed by authors who have discovered much new material, but all the use they have made of it has become an indirect tribute to the natural sagacity of Robertson. He received £4500 for the copyright, and was gratified by the most flattering praises from Voltaire and Gibbon. The *History of America* appeared in 1777; *An Historical Disquisition concerning the Knowledge which the Ancients had of India* in 1791. Robertson died near Edinburgh, 11th June 1793, and was buried in the Greyfriars churchyard.

Robertson's Histories are still excellent reading, although in every case they have been left behind by the more valuable works of a later day. Their merit is great, considering the slenderness of the materials then available and the fact that he lived almost half a century before the modern conception of the scope and method of history awoke. None of his contemporaries philosophised on defective data with greater dignity or less unconsciousness of 18th-century limitations; but it is true that many of the remarks in his review of the state of Europe display a quite remarkable sagacity and power of generalisation. His style is clear and correct, but is formal, and lacks idiomatic vigour and spontaneity.

See the short account of his life by Dugald Stewart; Carlyle's *Autobiography;* Brougham (a grand-nephew, who, a boy of fifteen, had stood beside the historian's grave), *Lives of Men of Letters of the Time of George III.;* and Lord Cockburn's *Memorials of his Life and Times*, for an interesting sketch of his appearance and conversation in his last years.

Robertson, Rev. William Bruce, D.D. (born 24th May 1820, died 27th June 1886), always called 'of Irvine'—his first and only charge—was ordained to the United Presbyterian church there in 1843. As a student he had spent many hours with De Quincey, and largely owing to his advice had finished his theological course at Halle, chiefly under Tholuck. Serious illness in 1871 incapacitated him from ever resuming regular work. Between 1871 and 1878 he was much in Italy. Thereafter he was able to undertake occasional preaching, his sermons and week-day lectures at Cambridge, 1879–81, being the most memorable. Possessed of a strong sense of humour, he could make it serve the highest ends, or could pass at once without effort or jar to the most solemn subjects. Gifted with a striking presence and a sonorous, well-regulated voice, Calvinist in doctrine, but catholic in sympathy; a staunch Presbyterian, but with a keen eye to the artistic beauty of cathedrals; an ardent admirer of Luther, but a loving student of the liturgy and hymns of the Roman Church; a seer rather than a theologian, he made music and painting, sculpture and architecture all minister by illustration and analogy to the evangelical setting forth of the gospel and cross of Christ. Unfortunately he published nothing beyond a translation of the *Dies Iræ* and one or two sacred songs.

For other poems and jottings of a few of his sermons, see his Life, by Rev. James Brown, D.D. (1889); and *Robertson of Irvine, the Poet Preacher*, by A. Guthrie (1889).

Robes, Mistress of the. See Household.

Robespierre, Maximilien Marie Isidore, was born of a legal family, originally of Irish origin, at Arras, 6th May 1758. His mother died in 1767, his broken-hearted father two years later, and the four children were brought up by their maternal grandfather, an Arras brewer. Maximilien, the eldest, early showed unusual promise, and was educated at Arras and at the Collége Louis-le-Grand at Paris, where Camille Desmoulins was a fellow-student. He was admitted *avocat* in 1781, and next year was named criminal judge by the bishop of Arras, but resigned his place soon after to avoid passing a sentence of death. All through life a fanatical devotee of the gospel according to Rousseau, his sentimentality and taste for verses made him popular among the *Rosati* at Arras. He drew up the *cahier* or list of grievances for the guild of cobblers, and was elected to the States-general in 1789 as one of the deputies for the *tiers état* of Artois. He soon attached himself to the extreme Left—the 'thirty voices,' and though his first speeches excited ridicule, it was not long before his earnestness and his high-sounding phrases commanded attention. 'That young man believes what he says; he will go far,' said Mirabeau, forecasting his future with the divination of genius. Indeed his influence grew daily, both in the Jacobin Club and in the Assembly, and thousands amongst the mob of patriots outside became fanatical in their admiration of his sincere cant and his boasted incorruptibility. Three days after the death of Mirabeau he called upon the Assembly to prevent any deputy from taking office as minister for four years, and in the following month (May 1791) carried the motion that no member of the present Assembly should be eligible for the next. This policy grew out of the narrow and acrid suspiciousness of his own nature, and reveals the inherent meanness of his aims and his failure to grasp that grand idea of real parliamentary government by a responsible ministry, which had been the dearest dream of Mirabeau. Next followed Robespierre's appointment as public accuser, the king's flight to Varennes (June 21st), Lafayette's last effort to control the sacred right of Insurrection on the Champ-de-Mars (17th July), the abject terror of Robespierre, his sheltering himself in the house of Duplay, a carpenter, his hysterical appeal to the Club, the theatrical oath taken by every member to defend his life, and his being crowned with chaplets, along with Pétion, and carried home in triumph by the mob at the close of the Constituent Assembly (30th September).

After seven weeks of quiet he sold his small patrimony and returned to Paris, to the house of Duplay, where he remained to the last day of his life. He was much beloved in the family, and a passion quickly sprung up betwixt himself and his host's eldest daughter Eléonore, a romantic girl of twenty-five. His room was a humble chamber in which he worked and slept; its decorations, a few busts and portraits of himself. Alone amongst the patriots he was noted for the carefulness of his dress, which never varied in the slightest—powdered hair, a bright blue coat, white waistcoat, short yellow breeches, with white stockings and shoes with silver buckles. Small and feeble in frame, solitary and reserved in habits, he ever wore an anxious look upon his straitened and spectacled face; his complexion was atrabilious, even *verdâtre;* and he retained to the last the sobriety of the cynic, drinking only water.

Meantime the Girondist party had been formed in the new Legislative Assembly, its leaders—the loudest, Brissot—eager for war. Robespierre, who ever feared and disliked war, offered a strenuous opposition in the debates of the Jacobin Club, and sometimes, if seldom, in his endless and windy harangues rose into the region of real eloquence. Fundamentally an empty pedant, inflated with words which he mistook for ideas, in his orations he is ever riding in the air on theories, his foot never on the solid ground of the practical. In April 1792 he resigned his post of public prosecutor. He was invisible during the crisis of the 10th August, but he joined the Hôtel-de-Ville faction, and on the 16th August we find him presenting to the Legislative Assembly its petition for a Revolutionary Tribunal and a new Convention. It does not appear, however, that he was in any sense directly responsible for the atrocious September massacres in the prisons, or more than a mere accessory after the fact. For his reward he was elected first deputy for Paris to the National Convention, which opened on the 21st September. The bitter attacks upon him by the Girondists were renewed only to throw Robespierre into a closer union with Danton and his party, but the final struggle was interrupted for a little by the momentous question of the king's trial. Robespierre opposed vigorously the Girondist idea of a special appeal to the people on the king's death, and his execution (21st January 1793) opened up the final stage of the struggle, which ended in a complete triumph of the Jacobins on the 2d June of the same year. The first Committee of Public Safety—a permanent Cabinet of Revolution—was decreed in April 1793, but Robespierre was not elected till the 27th July. He was now for the first time one of the actual rulers of France, but it is open to question whether for the whole twelve months from this time to the end he was not merely the stalking-horse for the more resolute party within the Twelve. His vaunted respectability, his great popularity with the mob, and his

gift of fluent, if vague and windy, oratory made an admirable cover for the truculent designs of strong and completely unscrupulous men like Billaud-Varennes and Collot d'Herbois, and at least it is certainly the case that Couthon and Saint-Just were the only members whose political and social ideals coincided with his own. Destitute of political intuition, without foresight or sagacity, himself the mere dupe of a few borrowed phrases, he was strong because within his narrow limits he was honest, and because he actually had a horizon of social ideals, not nakedly identical with his own advantage. He was astute enough, moreover, to play off one force against another—the Convention, the Commune, and the Committee, while he derived his strength from the constant worship of the Club.

The next scenes in the great drama of Revolution were the dark intrigues and desperate struggles that sent Hébert and his friends to the scaffold on the 24th March 1794, and Danton and Robespierre's school-fellow, Camille Desmoulins, on the 5th of April after. Hébert Robespierre had long disliked, and Chaumette's crazy deification of the Goddess of Reason had filled him with disgust; Danton he at once hated and feared with that fierce and spiteful hatred he ever felt instinctively for men like the great Tribune and Vergniaud with natural gifts beyond his own. 'Robespierre will follow me: I drag down Robespierre,' said Danton with prophetic truth. The next three months he reigned supreme, but his supremacy prepared the way for his inevitable fall. He nominated all the members of the Government Committees, placed his creatures in all places of influence in the commune of Paris, sent his henchman Saint-Just on a mission to the armies on the frontier, assumed supreme control of the Revolutionary Tribunal, and completely revolutionised its method of operation by the atrocious measure introduced by his creature Couthon on the 22d Priarial (10th June), to the effect that neither counsel nor witnesses need be heard if the jury had come otherwise to a conclusion. The fatal significance of this change —a complete abrogation of all law—is seen in the fact that from this time till the day of Robespierre's death the daily tale of victims of the guillotine averaged almost thirty. But, in accordance with the law that governs all human things, as Robespierre's power increased his popularity decreased, and still further he had committed the fatal folly of making himself publicly ridiculous. Already his voluntary bodyguard of *Tappe-durs* had excited derision and resentment, but his declaration on 7th May of a new religion for the state—the foundation of a new regime of public morality—awakened in the mind of Paris the slumbering sense of humour. The Convention at Robespierre's instance agreed to compliment the Supreme Being with an acknowledgment of His existence and themselves with the Consolatory Principle of the Immortality of the Soul, to be celebrated in thirty-six annual festivals. The first of these was held on the 8th of June, when Robespierre, glorious in a new violet-blue coat, walked in front of the procession and delivered his soul of a vapid harangue, and set fire to pasteboard figures representing Atheism, Selfishness, Annihilation, Crime, and Vice. An old mad woman named Catherine Theot, who thought herself the mother of God, now declared Robespierre to be the new divine Saviour of the world, and drew down upon him still further ridicule in the Convention. Meantime the pace of the guillotine grew faster, although apparently Robespierre hoped to bring it to a close as soon as all his more dangerous enemies, like Tallien, Fouché, and Vadier, were cut off. Meantime the public finance and the work of government generally drifted to ruin, and Saint-Just openly demanded the creation of a Dictatorship in the person of Robespierre as alone possessing intellect, energy, patriotism, and revolutionary experience enough. On the 26th July (8th Thermidor), after about a month's absence, the Dictator delivered a long harangue complaining that he was being accused of crimes unjustly. He was listened to in deep and unsympathetic silence, and the Convention, after at first obediently passing his decrees, next rescinded them and referred his proposals to the committees, and the sitting ended without anything being concluded. That night at the Jacobin Club his party again triumphed, and the Tallien party in despair hurried to the members of the Right, the Girondist remnant, and implored their help against the common enemy at this desperate juncture. Next day at the Convention Saint-Just could not obtain a hearing. Tallien, Billaud-Varennes, and Vadier vehemently attacked Robespierre, and the voice of the Dictator himself was drowned with cries of 'Down with the tyrant!' Turning to the Right, 'I appeal to you whose hands are clean,' he cried, but the Right sat in stony silence. 'President of Assassins, I demand to be heard,' he cried, but his voice died down in his throat.—'The blood of Danton chokes him,' cried Garnier. An unknown deputy named Louchet proposed that Robespierre should be arrested, and at the fatal words his power crumbled into ruins. His younger brother and Lebas demanded to be included in the honourable sentence. Vain attempts were made by the Jacobin Club and the Commune to save their hero, but Paris refused to move, and even Henriot's artillerymen to obey. Robespierre broke his arrest and flew to the Common Hall, whereupon the Convention at once declared him out of the law. The National Guard under Barras turned out to protect the Convention, and Robespierre had his lower jaw broken by a shot fired by a gendarme named Merda, or, as many believed, by his own hand. Next day (28th July; 10th Thermidor 1794), still in his sky-blue coat, the miserable, trembling wretch died with Saint-Just, Couthon, and nineteen others by the guillotine; the day after seventy-one members of the municipality followed, twelve more on the third day, and the Reign of Terror was extinguished in a sea of blood.

See the histories of the Revolution by Lamartine, Michelet, Louis Blanc, Carlyle, Von Sybel, H. Morse Stephens, and M. Taine; the Life by G. H. Lewes (1849); and especially Ernest Hamel's exhaustive and authoritative, although vastly over-eulogistic, *Vie de Robespierre* (3 vols. 1865–67), also his *Thermidor* (1891).

Robin. See REDBREAST. The American Robin is a Thrush (q.v.)—the *Turdus migratorius;* and the name of Golden Robin is sometimes given to the Baltimore Bird (q.v.).

Robin Goodfellow. See PUCK.

Robin Hood, the hero of a group of old English ballads, represented as an outlaw and a robber, but of a gallant and generous nature, whose familiar haunts are the forests of Sherwood and Barnsdale, where he fleets the time carelessly in the merry greenwood. He is ever genial and good-natured, religious, respectful to the Virgin and to all women for her sake, with a kind of gracious and noble dignity in his bearing. He lives by the king's deer, although personally most loyal, and wages ceaseless warfare on all proud bishops, abbots, and knights, taking of their superfluity, and giving liberally to the poor and to all honest men in distress, of whatever degree. He is unrivalled with the bow and quarter-staff; but in as many as eight of the extant ballads comes off the worse in the combat with some stout fellow, whom he thereupon induces to join his company. His chief comrades are Little John, Scathlok (Scarlet), and

Much; to these the *Gest* adds Gilbert of the White Hand and Reynold. A stalwart curtal friar, called Friar Tuck in the title though not in the ballad, fights with Robin Hood, and apparently accepts the invitation to join his company, as he appears later in two broadsides, which also mention Maid Marian. Such is the romantic figure of the greatest of English popular heroes—a kind of yeoman-counterpart to the knightly Arthur.

The earliest notice of Robin Hood yet found is that pointed out by Percy in *Piers Plowman*, which, according to Skeat, cannot be older than about 1377. Here Sloth says in his shrift that, though but little acquainted with his paternoster, he knows 'rymes of Robyn Hood and Randolf, erle of Chestre.' In the next century we find him mentioned in Wyntoun's *Chronicle of Scotland* (*c.* 1420); a petition to parliament in the year 1439 represents a broken man in Derbyshire taking to the woods 'like as it hadde be Robyn-hode and his meyné;' Bower, in his *Scotichronicon* (1441–47), describes the lower orders of his time as entertaining themselves with ballads both merry and serious about Robin Hood, Little John, and their mates, and preferring them to all others; and Major or Mair (*c.* 1470–1550) says in his *Historia Maioris Britanniæ* that Robin Hood ballads were sung all over Britain. The last passage gives apparently the earliest mention of those more romantic and redeeming features of Robin Hood which earned him a place in Fuller's *Worthies of England*, under his proper county, sweet Nottinghamshire, 'not for his thievery but for his gentleness.' Yet another 15th-century mention occurs in the *Paston Letters*, where Sir John Paston writes in 1473 of a servant whom he had kept to play Robin Hood and the Sheriff of Nottingham.

Fragments of two Robin Hood plays exist, one dating from 1475, the other printed by Copland with the *Gest* about 1550. The latter is described in the title as 'very proper to be played in May-games.' Robin Hood was a popular figure in these during the 16th century, as we find from Stow, Hall, and other writers, and there is evidence that in this connection he was known as far north as Aberdeen. In place-names again we find traces of him in cairns, mounds, hills, rocks, crosses, fountains, caves, and oaks from Somerset to Whitby. In the *Gest* the localities around Barnsdale are topographically correct, down to the place of his leath at the priory of Kirkless between Wakefield and Halifax. Here the valiant outlaw is treacherously bled to death by his kinswoman the prioress, to whom he had gone for relief in his sickness. His last charge to Little John is completely true to his character, and is expressed in lines of touching simplicity:

> Lay me a green sod under my head.
> And another at my feet;
> And lay my bent bow by my side,
> Which was my musie sweet;
> And make my grave of gravel and green,
> Which is most right and meet.

There is no evidence worth anything that Robin Hood was ever more than a mere creation of the popular imagination, but in due time the yeoman became a political personage, and was transformed into an Earl of Huntingdon for whom a suitable pedigree was constructed. Both Sir Walter Scott, in *Ivanhoe*, and Thierry, in his *Conquête de l'Angleterre*, make him a Saxon chief holding out like Hereward against the Normans; Bower, the continuator of Fordun, distinctly calls him one of the proscribed followers of Simon de Montfort; Joseph Hunter (1852) makes him an adherent of the Earl of Lancaster in the insurrection of 1322. The last scholar discovered a still further and exceptionally amusing mare's nest in the name of one Robyn Hode, who entered the service of King Edward II. about Christmas 1323 as one of the 'vadlets, porteurs de la chambre,' and was eleven months later found unfit for his duties, and paid off with a gift of five shillings. 'To detect "a remarkable coincidence between the ballad and the record" requires,' says Professor Child, 'not only a theoretical prepossession, but an uncommon insensibility to the ludicrous.' Kuhn again identifies our outlaw with Woden; others with a sun-god, a woodland deity, and the like—all which subtleties of speculation are unnecessary if we readily admit that the hero of popular creative imagination may well have formed a peg round which to hang much old-world wood-lore even then fast fading into forgetfulness.

Of Robin Hood ballads there have come down to us in more or less ancient form as many as forty, of which eight may be said to be of the first importance, and of almost the finest quality of ballad poetry. Of the remaining thirty-two, as Professor Child points out, about half a dozen have in them something of the old popular quality; as many more not the least snatch of it. Fully a dozen are variations, sometimes wearisome, sometimes sickening, upon the theme 'Robin Hood met with his Match.' The best of all the cycle are perhaps 'Robin Hood and the Monk,' and 'Robin Hood and Guy of Gisborne,' and both open with a delightful glimpse of the green wood a century and more before its time in English poetry—

> In somer, when the shawes be sheyne,
> And leves be large and long,
> Hit is full mery in feyre foreste
> To here the foulys song:
>
> To se the dere draw to the dale,
> And leve the hilles hee,
> And shadow hem in the levës grene,
> Under the grene-wode tre.

The second begins no less beautifully—

> When shawes beene sheene, and shradds full fayre,
> And leeves both large and longe.
> Itt is merry, walking in the fayre fforrest,
> To hear the small birds songe.

The *Lytell Geste of Robyn Hode* was printed by Wynken de Worde, most probably before 1500, a long poem of over 1800 lines, arranged in eight *fyttes*, being a not unskilful redaction of at least four earlier distinct ballads.

See Ritson's collection of Robin Hood ballads (2 vols. 1795); J. M. Gutch's *Lytell Geste of Robin Hode* (2 vols. 1847); the *Percy Folio Manuscript*, vol. i. (1867), and the Introduction to the Robin Hood ballads there by Professor Hales; and especially part v. (Boston, 1888) of Professor Child's magistral *English and Scottish Popular Ballads*. The first known 'Garland' was printed in 1670, and in 1678 there appeared a prose version of it, reprinted by W. J. Thoms in his *Early English Prose Romances* (vol. ii. 2d ed. 1858).

Robin Hood's Bay, a fishing-village in the North Riding of Yorkshire, 6¾ miles SE. of Whitby by the coast railway to Scarborough, opened in 1885. The bay on which it stands is picturesquely fringed by lofty cliffs, rising in the Old Peak, its southern horn, to a height of 585 feet. It owes its name to traditions of Robin Hood, whose arrows shot from the tower of Whitby Priory reached Hawkser, 3 miles distant.

Robinia, a genus of trees and shrubs of the natural order Leguminosæ, sub-order Papilionaceæ. The most important species is the Locust Tree (q.v.), also known as the False Acacia, or Thorn Acacia, often simply designated Acacia. It is a native of North America, extending from Canada to the southern states, and is there much valued for the hardness and durability of its timber. With it, it is alleged, the houses of the Pilgrim Fathers were built, and the city of Boston founded. When green it is of soft texture, but when mature and seasoned it rivals the oak for strength and

durability. It is close grained and finely veined, and in America is the most valued of all timbers for cabinet-work. On account of its quick growth, its spines, and its property of submitting to be clipped into any form, it is very suitable for hedges. In the south of Europe it succeeds well as a timber-tree, but in more northern regions it suffers from frost in severe winters; and in Britain it often suffers from frost, owing to the imperfect ripening of the wood in summer. It does not readily rot in water, and is used for shipbuilding. The tree is very ornamental, and of rapid growth. The flowers are fragrant and white, in large pendulous racemes. In San Domingo its flowers are used for making a distilled liquor and a syrup. The roots throw up many suckers, and are very sweet, affording an extract resembling liquorice.—*R. viscosa* is a smaller tree, but even more ornamental, a native of the south-western parts of the Alleghany Mountains. It has rose-coloured scentless flowers. The young branches are viscid.—The Rose Acacia (*R. hispida*) is a native of the south-western ranges of the Alleghanies, and is a highly ornamental shrub, with hispid branches, and large rose-coloured scentless flowers.

Robins, Benjamin, mathematician, the father of the military art of gunnery, was born at Bath in 1707 of a poor Quaker family. Having obtained a little instruction in mathematics, he prosecuted this branch of science with great zest, and, having removed to London, set up for a teacher of mathematics, and published several mathematical treatises which gained for him considerable reputation. Robins next commenced his great series of experiments on the resisting force of the air to projectiles, varying his labours by the study of fortification, and invented the Ballistic Pendulum (q.v.). In 1734 he demolished, in a treatise entitled *A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions*, the objections brought by the celebrated Berkeley, Bishop of Cloyne, against Newton's principle of ultimate ratios. His great and valuable work, the *New Principles of Gunnery*, upon the preparation of which he had spent an enormous amount of labour, appeared in 1742, and produced a complete revolution in the art of Gunnery (q.v.). In consideration of his able defence of the policy of the then government, by means of pamphlets which he wrote and published from time to time, he received (1749) the post of 'Engineer-in-general to the East India Company;' but his first undertaking, the planning of the defences of Madras, was no sooner accomplished than he was seized with a fever, and he died July 29, 1751. His works were collected and published in 1761.

Robinson, Edward, philologist and biblical scholar, was born at Southington, Connecticut, April 10, 1794, graduated at Hamilton College, New York, in 1816, and there remained till 1821, when he went to Andover, Massachusetts, to see through the press an edition of part of the *Iliad*. Here he studied Hebrew under Professor Stuart, but in 1826 went to Germany, where he studied under Gesenius and Neander, and married as his second wife Therese A. L. von Jakob, daughter of a professor at Halle. In 1830 he became extra-ordinary professor of Sacred Literature at Andover, in 1837 professor of Biblical Literature in the Union Theological Seminary, New York. He now made an extensive survey of Palestine, collecting materials for *Biblical Researches in Palestine and Adjacent Countries* (3 vols. 1841). A second visit in 1852 yielded fruit for its second edition (1856). Robinson died in New York, 27th January 1863.

His other works are a translation of Buttmann's *Greek Grammar* (1832); *Greek and English Lexicon of the New Testament* (1836; 1850); *Harmony of the Gospels*, in Greek (1845), and in English (1846). He was also editor of the *Biblical Repository*, *Bibliotheca Sacra*, Calmet's *Bible Dictionary*, and a translation of Gesenius' *Hebrew Lexicon*.

His wife, Therese Albertine Louise von Jakob, well known to the world of letters as 'Talvi,' a name composed of her initials, was born at Halle, January 26, 1797. At ten she went to Kharkoff in Russia, where her father had become professor, but in 1810 they removed to St Petersburg. In 1816 they returned to Halle, and here she studied Latin, and wrote her volume of tales, *Psyche* (1825). As 'Ernest Berthold' she published translations of Scott's *Black Dwarf* and *Old Mortality*, and also two volumes of Servian popular songs, *Volkslieder der Serben* (1825–26). In 1828 she married Robinson, and in 1830 accompanied him to America. After his death she lived mostly at Hamburg, where she died 13th April 1869.

Robinson, Henry Crabb, born of middle-class parentage at Bury St Edmunds on 13th May 1775, was educated there and at Devizes, and then was articled to a Colchester attorney (1790–95). He studied five years at Jena, Weimar, &c. (1800–5), making friends or acquaintances of nearly all the great German spirits of the day, and during 1807–9 was engaged on the *Times*—in Spain, the first war-correspondent. In 1813, at the age of thirty-eight, he was called to the bar, from which, having risen to be leader of the Norfolk circuit, he retired in 1828 with £500 a year. 'In looking back on his life, Mr Robinson used to say that two of the wisest acts he had done were going to the bar and quitting the bar.' Thenceforth he lived chiefly in London, with frequent tours both at home and abroad till 1863, giving and receiving much hospitality, until at the ripe age of ninety-one he died unmarried on 5th February 1867. A dissenter and a Liberal, he was one of the founders of the London University (1828), an early member of the Athenæum Club (1824). Withal he was a splendid talker, who 'talked about everything but his own good deeds,' a buoyant companion, an earnest thinker, a prodigious reader, content not to publish but to keep a diary. 'I early found,' he says, 'that I had not the literary ability to give me such a place among English authors as I should have desired; but I thought that I had an opportunity of gaining a knowledge of many of the most distinguished men of the age, and that I might do some good by keeping a record of my interviews with them. True [which was not quite true], I want in an eminent degree the Boswell faculty; still, the names recorded in *his* great work are not so important as Goethe, Schiller, Herder, Wieland, the Duchesses Amelia and Louisa of Weimar, Tieck, as Madame de Staël, La Fayette, Abbé Grégoire, Benjamin Constant, as Wordsworth, Southey, Coleridge, Lamb, Rogers, Hazlitt, Mrs Barbauld, Clarkson, &c., &c., &c., for I could add a great number of minor stars. And yet what has come of all this? Nothing. What will come of it? Perhaps nothing.' Yes, something has come of it—the three delightful volumes, edited in 1869 by Dr Sadler, of his *Diary, Reminiscences, and Correspondence*, which will last as long as literature itself.

Robinson, John, pastor of the Pilgrim Fathers, was born, probably in Lincolnshire, about 1575, was a Fellow of Corpus Christi, Cambridge, and ministered to a church near Norwich, until he was suspended for his Puritan tendencies. In 1604 he resigned his fellowship and all connection with the Church of England, and gathered a congregation of dissenters at Gainsborough. He was afterwards a minister at Scrooby, but in 1608 he and his flock escaped to Amsterdam; in 1609 he passed to Leyden, and there in 1611 he established a

church, and in 1613 met Episcopius, Arminius' successor, in debate. In 1620, after a memorable sermon, he saw the younger members of his congregation set sail in the *Speedwell* (which vessel they afterwards changed for the *Mayflower*). He himself intended to, and his son in 1631 did, follow them to Massachusetts. He died at Leyden in March 1625. His works, with a memoir by R. Ashton, were collected in 3 vols. (Lond. and Boston) in 1851. In 1891 a large bronze tablet to his memory was placed by the American Congregational churches on the outer wall of St Peter's, Leyden, in one of whose vaults he is buried.

Robinson, MARY, poetess, born at Leamington, 27th February 1857, resided long in Italy, and in 1888 was married to M. Darmesteter, the French Orientalist, and became a resident in Paris. Amongst her poetical works are *A Handful of Honeysuckle* (1878), a translation of Euripides' *Hippolytus* (1881), *The New Arcadia* (1881), *Songs, Ballads, and a Play* (1886). She has also written Lives of Emily Brontë (1883) and Margaret of Angoulême (1880), and a historical work, *The End of the Middle Ages* (1889).

Robison, JOHN, was born at Boghall in Stirlingshire in 1739, and educated at Glasgow grammar-school and university. He devoted himself early to physical science, became acquainted with James Watt and Dr Black, and succeeded to the latter's chair on his transference to Edinburgh in 1766. Four years later he went to Russia as secretary to Admiral Knowles, who had been appointed president of the Russian Board of Admiralty. In 1774 he accepted the chair of Natural Philosophy at Edinburgh, but he made an indifferent lecturer, and disliked experiments. He died January 28, 1805. His *Elements of Mechanical Philosophy* was edited by Sir D. Brewster (4 vols. 1822). His foolish *Proofs of a Conspiracy against all the Religions and Governments of Europe, carried on in the Secret Meetings of Freemasons, Illuminati, and Reading Societies* (1797) is a lasting monument of fatuous credulity.

Rob Roy (Gaelic, 'Red Robert'), the Scottish Robin Hood, was born in the year 1671, the second son of Lieut.-colonel Donald Macgregor of Glengyle. Till 1661 the 'wicked clan Gregor' had for more than a century been constantly pursued with fire and sword; the very name was proscribed. But from that year until the Revolution the severe laws against them were somewhat relaxed; and Rob Roy, who married a kinswoman, Mary Macgregor, lived quietly enough as a grazier on the Braes of Balquhidder. From youth, however, he was a master of the claymore, the uncommon length of his arms giving him much advantage, for without stooping he could tie the garters of his Highland hose, 2 inches below the knee. Then his herds were so often plundered by 'broken men' from the north that he had to maintain a band of armed followers to protect both himself and such of his neighbours as paid him blackmail. And so with those followers, espousing in 1691 the Jacobite cause, he did a little plundering for himself, and, two or three years later having purchased from his nephew the lands of Craigroyston and Inversnaid, laid claim thenceforth to be chief of the clan. In consequence of losses incurred about 1712 in unsuccessful speculations in cattle, for which he had borrowed money from the Duke of Montrose, his lands were seized, his houses plundered, and his wife shamefully used, turned adrift with her children in midwinter. Maddened by these misfortunes, Rob Roy gathered his clansmen and made open war on the duke, sweeping away the whole cattle of a district, and kidnapping his factor with rents to the value of more than £3000 Scots. This was in 1716, the year after the Jacobite rebellion, in which at Sheriffmuir Rob Roy had 'stood watch' for the booty, and had been sent by the Earl of Mar to raise some of the clan Gregor at Aberdeen, where he lodged with a kinsman, Professor Gregory. Marvellous stories are current round Loch Katrine and Loch Lomond (where a cave near Inversnaid still bears his name) of his hairbreadth escapes from capture, of his evasions when captured, and of his generosity to the poor, whose wants he supplied at the expense of the rich. They in return gave him timely warning of the designs of his two arch-foes, the Dukes of Montrose and Athole, and of the red-coats they called to their aid from Dumbarton and Stirling; besides, Rob Roy enjoyed the protection of the Duke of Argyll, having assumed the name Campbell, his mother's. Late in life he is said to have turned Catholic, but in the list of subscribers to the Episcopalian church history of Bishop Keith occurs the name 'Robert Macgregor *alias* Rob Roy.' The history came out in 1734, and on the 28th December of that same year Rob Roy died in his own house at Balquhidder. He left five sons, two of whom died in 1754—James, an outlaw, in Paris; and Robin, the youngest, on the gallows at Edinburgh for abduction.

See the introduction and notes to Scott's *Rob Roy* (1817); Dorothy Wordsworth's *Tour in Scotland in 1803*, with her brother's poem; and the Lives of Rob Roy by K. Macleay (1818; new ed. 1881) and A. H. Millar (1883).

Robsart, AMY. See LEICESTER, EARL OF.

Robson, FREDERICK, whose real name was F. R. BROWNBILL, low comedian, was born at Margate in 1821. He was apprenticed to a London copperplate engraver; but became smitten with stage fever and took to the actor's life (1844). From 1853 he was inseparably associated with the Olympic Theatre of London, where he attracted large audiences for years by his representations in comedy, farce, and burlesque. An actor of original genius, Robson excelled in parts that were grotesque, eccentric, quaintly humorous or droll; he was particularly effective in sudden transitions from comicality to pathos, and the reverse, and in the delineation of violent and tumultuous passion. He gave a vivid portrait of the street outcast as Jem Baggs in the *Wandering Minstrel*, in which he sang the once celebrated 'Villikins and his Dinah.' He burlesqued Macbeth and Shylock, uniting in his playing the ludicrous and the terrible. One of his principal characters was Desmarets, a spy of Fouché's, a shabby-looking, fawning, cunning, malicious old man in the play *Plot and Passion*. Others of his strongest impersonations were as the dwarf in Planché's *Yellow Dwarf*, the Doge of Duralto, Daddy Hardacre, Sampson Burr, and Uncle Zachary in *Peter and Paul*. He died 12th August 1864. See Dutton Cook in *Gentleman's Magazine* (1882), and G. A. Sala in *Atlantic Monthly* (1863).

Roburite, a flameless explosive, composed of chlorinated dinitro-benzene mixed with sufficient ammonium nitrate to completely oxidise it.

Roc, or RUKH, a fabulous bird of immense size, able to carry off an elephant in its talons. The idea is familiar in the East, and every reader will remember it in the *Arabian Nights' Entertainments*. Colonel Yule pointed out that the huge fronds of the Raphia (q.v.) palms were brought from Madagascar as roc's feathers. Mythical birds of similar size and strength were the Arabian *'anká* and the Persian *símurgh*. The *amru* or *sínamrú* was an older Persian supernatural bird; the Indian *garuda*, which bears Vishnu, is the king of birds. It has been suggested, without good grounds, that the legends of the roc might have originated in traditions of extinct birds of great size, like the

Dinornis or Æpyornis, which, however, could not fly.

Rocambole (*Allium scorodoprasum*), a plant of the same genus with garlic, onion, leek, &c., and nearly allied to garlic, which it resembles in its habit, although larger in all its parts. The root forms rounder cloves than those of garlic, and of much milder flavour; the umbels are also bulbiferous. Rocambole has long been cultivated in kitchen-gardens. It is a native of sandy soils in Denmark and other countries near the Baltic.

Roccella. See Archil.

Rocha, a south-eastern department of Uruguay, on the Atlantic; hilly in the south, in the north a swamp. Area, 4280 sq. m.; pop. (1887) 18,494.

Rochambeau, Jean Baptiste Donatien de Vimeure, Comte de, was born at Vendôme, 1st July 1725, entered the army in 1742, was at the siege of Maestricht, and distinguished himself at Minorca in 1756. In 1780 he was sent out in command of an army of 6000 men to support the Americans, and in 1781 he rendered effective help at Yorktown. He became marshal in 1791, and in 1804 Napoleon made him a grand officer of the Legion of Honour. He died 10th May 1807. See his *Mémoires* (2 vols. 1809; Eng. trans. 1838).

Rochdale, a thriving manufacturing town of Lancashire, a municipal, parliamentary, and county borough, on the Roche, 11 miles N. by E. of Manchester and 202 NNW. of London. St Chad's parish church, on an eminence approached by a flight of 122 steps, dates from the 12th century, but is mainly Perpendicular in style. It is a handsome edifice, on which £10,000 was expended in 1884–85. The town-hall, erected in 1866–71, is a very fine Domestic Gothic building. The town besides has an infirmary (1883), a free grammar-school, founded in 1565 by Archbishop Parker, and rebuilt in 1846, a free library (1884), a post-office (1875), public baths (1868), a bronze statue of John Bright (1891), and a public park of 12 acres. Still, many as are the improvements in the architectural and sanitary condition of Rochdale within recent years, it is beautiful only in site, and derives its importance wholly from its extensive and varied manufactures. To the growing of wool was added a trade in woollen goods in the days of Elizabeth, when cotton goods also were sold here, and coal-pits worked. Under the Stuarts the woollen manufacture was in full activity; but it was not till 1795 that the first cotton-mill was built, in which in 1802 the father of John Bright began his career as a weaver. Flannels and calicoes are now the staple manufactures, but there are also cotton-mills, foundries, ironworks, machine-shops, &c. Rochdale is the birthplace of Co-operation (q.v.), and the membership of its Equitable Pioneers' Society (1844) has increased from 28 to over 11,000, with an annual business representing more than a quarter million. Since 1832 Rochdale has returned one member to parliament, and in 1856 it was incorporated as a municipal borough. The latter in 1872 was made co-terminous with the parliamentary borough, whose boundary had been extended in 1867. The manor of Rochdale (*Recedam* in Domesday) was originally held by the Lacys of Pontefract, and through their descendants, the Dukes of Lancaster, passed to the crown. In 1628 it was sold to Sir John Byron, whose descendant, the poet Lord Byron (of Rochdale), sold it in 1823. Pop. of parliamentary borough (1851) 29,195; (1891) 71,458. See the history of the parish by Fishwick (1889).

Roche, Sir Boyle (1743–1867), an Irish bull-making M.P., created a baronet in 1782.

Rochefort, Henri, whose full style is Victor Henri, Comte de Rochefort-Luçay, a stormy-petrel of French politics, was born in Paris, 29th July 1832. He studied medicine, and became a clerk in the hôtel-de-ville, but was dismissed for neglecting his duties, and now cast himself entirely upon journalism, contributing to the *Charivari*, the *Figaro*, and other papers, until in 1868 he started his own notorious weekly, *La Lanterne*, which was quickly suppressed by the government. To avoid fine and imprisonment Rochefort fled to Brussels, but returned in 1869 on his election to the Chamber of Deputies for Paris. He now started the *Marseillaise*, in which he renewed his bitter attacks on the imperial regime. One consequence of the cowardly murder of its contributor, Victor Noir, by Prince Pierre Bonaparte, was the suppression of the paper and the imprisonment of its editor. The fall of the empire gave him his release, and opened up a rôle for the frothy rhetorician in the government of National Defence. In February 1871 he was elected by Paris to the National Assembly, and soon made public his Communism in the pages of *Le Mot d'Ordre*. As soon as he foresaw the end of the Commune, about the middle of May, he left his dupes and comrades to their doom, and made his escape from Paris. But the Prussians caught him at Meaux and sent him to Versailles, where he was sentenced to imprisonment for life. Later he was deported to New Caledonia, whence he escaped in 1874. In London and Geneva he tried to revive the *Lanterne* and influence the Parisian press, but at length he was enabled to return by the general amnesty of 11th July 1880. In his newspaper, *L'Intransigeant*, he showed himself as impracticable as ever, sat in the National Assembly (1885–86), took up Boulangism, and returning to France in 1895, published *The Adventures of My Life* (1896; Eng. trans. abridged, 1896).

Rochefort-sur-mer, a French seaport, naval arsenal, and fortress of the first class, in the department of Charente-Inférieure, stands on the right bank of the Charente, 9 miles from its mouth, and 18 miles SSE. of Rochelle, 89 SW. of Poitiers. It was founded in 1665 as a naval station by Colbert, Louis XIV.'s minister, and fortified by Vauban, being covered now on the sea side by strong forts; and it is a modern, clean, well-built place, with which few French towns can compare for the number and importance of its public works. The most celebrated of these is the naval hospital (1783–88), with nearly 1300 beds, and an artesian well 2758 feet deep. There are both a naval harbour and, higher up the river, a commercial harbour with three basins; and Rochefort besides possesses rope-walks, cannon-foundries, and other establishments for the manufacture and preservation of naval stores and marine apparatus of every kind. From 1777 till 1852 it was the seat of a great convict prison. Napoleon meant to take ship for America at Rochefort, but instead had to surrender to Captain Maitland of the *Bellerophon*, 15th July 1815. Pop. (1872) 26,619; (1891) 32,445. See Viaud and Fleury's *Histoire de Rochefort*.

Rochefoucauld. See La Rochefoucauld.

Rochejaquelein. See Larochejaquelein.

Rochelle, La, a seaport and second-class fortress of France, capital of the department of Charente-Inférieure, on an inlet of the Bay of Biscay, formed by the islands Ré and Oléron, 91 miles WSW. of Poitiers and 297 SW. of Paris. Its harbour, which consists of an outer tidal basin and an inner wet-dock, is still sheltered by the remains of Richelieu's famous dyke, and is surrounded by fine quays, close to which lie the principal streets and squares. Many of the latter are regular and well built, and present a handsome appearance from the number of houses which are adorned with porticoes and balconies. The most

noteworthy public buildings are the hôtel-de-ville (1486–1607), the palais-de-justice (1614), and the heavy Grecian cathedral (1742–1862). Besides the fine promenade of the Place du Château, there are, outside the city, two extensive public gardens, known as La Promenade du Mail and the Champs de Mars. Shipbuilding is actively carried on, especially in connection with the Newfoundland fishing trade; and besides this branch of industry, and the manufacture of briquettes and cotton yarns, Rochelle has numerous glass-works, sugar-refineries, and brandy distilleries. Pop. (1872) 19,070; (1891) 23,467. Rochelle, which was known till the 12th century under its Latin name of *Rupella*, 'Little Rock,' of which its present name is a mere translation, originated in a colony of serfs of Lower Poitou, who, fleeing from the persecution of their lord, settled on the rocky promontory between the ocean and the neighbouring marshes. On the marriage of Eleanor of Aquitaine with Henry II. of England, Rochelle, as part of her dowry, came into the possession of the English kings, by whom it was retained till 1224, when it was taken by Louis VIII.; and, although it was ceded to England at the treaty of Bretigny in 1360, in the subsequent wars it was retaken by France, under whose sway it has remained since 1372. A stronghold of the Huguenots (q.v.), it was unsuccessfully besieged in 1573, and in 1627–28 it for fourteen months again offered a heroic though unavailing resistance, under its mayor Guiton, to Cardinal Richelieu. Buckingham's expedition to relieve it failed, and at last the defenders, reduced from 27,000 to 5000, had to surrender to the troops of Louis XIII. With the exception of three towers (1384–1476) its old fortifications were destroyed, and new lines of defences subsequently erected by the great Vauban. Réaumur, Bonpland, Billaud-Varenne, Fromentin, Bouguereau, and Admiral Duperré (1775–1846) were natives. Of the last a statue was erected in 1869. See Barbot's *Histoire de la Rochelle* (ed. by Denys d'Aussy, 1886–91).

Rochelle Salt is the popular name of the tartrate of soda and potash ($KNaC_4H_4O_6+4H_2O$), this salt having been discovered in 1672 by a Rochelle apothecary named Seignette. It occurs, when pure, in colourless transparent prisms, generally eight-sided; and in taste it resembles common salt. It is prepared by neutralising cream of tartar (bitartrate of potash) with carbonate of soda. After a neutral solution has been obtained, it is boiled and filtered, and the resulting fluid is concentrated till a pellicle forms on the surface, when it is set aside to crystallise. This salt is a mild and efficient laxative, and is less disagreeable to the taste than most of the saline purgatives. From half an ounce to an ounce, dissolved in eight or ten parts of water, forms an average dose. A drachm of Rochelle Salt added to one of the ingredients of an effervescing draught (bicarbonate of soda or tartaric acid, for example) forms one of the varieties of what are called Seidlitz powders.

Roches moutonnées, smooth, rounded, hummocky bosses and undulating surfaces of rock, of common occurrence in regions which have been overflowed by glacier-ice. Those which have not been much acted upon by the weather generally show the scratches and groovings which are the characteristic markings of glacial action. Sometimes roches moutonnées are smoothed and polished all over, and have the appearance of whales' or dolphins' backs. At other times they are smoothed only on one side—that side, namely, which faces the direction from which the glaciating agent flowed; the other side, protected from abrasion, being left in its original rough, unpolished condition. The name *roches moutonnées* is that used by the Swiss peasants—the bare rounded rocks of a valley-bottom when seen from above having a fanciful resemblance to a flock of sheep lying down.

Rochester, a city of Kent, 29 miles ESE. of London, lies chiefly on the right bank of the tidal Medway, continuous with Chatham, and joined to Strood by an iron swing bridge, constructed in 1850–56 at a cost of £170,000. The castle or keep, which crowns a steep eminence near the bridge, was the work of Archbishop William de Corbeuil (1126); but the wall overlooking the river contains Norman masonry of earlier date, built upon Roman foundations. It is 104 feet high and 70 feet square, with walls 12 feet thick, and is a very fine specimen of Norman architecture; it was taken by John (1215, the south-east corner being rebuilt shortly afterwards), vainly attacked by De Montfort (1264), and taken again by Tyler (1381). Both castle and grounds were purchased in 1883 by the corporation from the Earl of Jersey. The episcopal see was founded in 604 by St Augustine, and the foundations of the cathedral then built have lately been discovered. Bishop Gundulf (1077–1107) built a new cathedral, of which part of the crypt remains. This cathedral was rebuilt by Ernulf and John of Canterbury (1115–37), whose nave remains; and the choir was again rebuilt and enlarged in the 13th century in part out of offerings of pilgrims at the shrine of St William of Perth, a Scotch baker, who, on a pilgrimage to the Holy Land, was murdered near Chatham by his companion and adopted son; the tower rebuilt by Cottingham (1825–26), the choir and transepts restored by Scott (1871–77), and the west front being restored by Pearson in 1891. It measures 306 feet in length, and has double transepts; and special features of interest are the Norman west doorway and nave, the Early English choir, of singular plan and early character, the spacious crypt, and a fine Decorated doorway leading to the modern library. The ruins of an early Norman keep or residence (?) built by Gundulf, the architect of the Tower of London, stand on the north side of the choir. Of Rochester's bishops since 604, some eighty in number, may be mentioned Paulinus (previously first bishop of York), Gundulf, Walter de Merton, Fisher, Ridley, Atterbury, and Horsley. St Bartholomew's Hospital, founded by Gundulf in 1078 for lepers, was refounded in 1863; the Norman chapel remains. Watts' Charity House, founded in 1579 to lodge 'six poor travellers, not being rogues or proctors,' has been immortalised by Dickens, whose home, Gadshill (q.v.), is 3 miles distant, and who introduces Rochester into *Pickwick*, *Edwin Drood*, and others of his novels. Three schools are the cathedral grammar-school (Henry VIII.), Williamson's mathematical school (1701; reopened under a new scheme, 1880), and a grammar-school for girls (1888); and other buildings are Satis House, Restoration House (Charles II. slept here in 1660), the guild-hall (1687), and the corn exchange (1871). Rochester—the Roman station *Durobrivæ* and Anglo-Saxon *Hrofe-ceastre*—was made a municipal borough by Henry II. It lost one of its two members in 1885. James II. embarked here in his flight (1688). Pop. (1851) 16,508; (1871) 18,352; (1891) 26,170.

See Wharton's *Anglia Sacra* (1691); Thorpe's *Registrum Roffense* (1769) and *Custumale Roffense* (1788); and other works by Rawlinson (1717), Fisher (1772), Rye (two, 1861-65), Walcott (1866), Langton (*Dickens and Rochester*, 1880), and Pearman (1898).

Rochester, (1) capital of Monroe county, New York, is on both sides of the Genesee River, 7 miles above its entrance into Lake Ontario, and on the Erie and Genesee Valley canals, by rail 67 miles ENE. of Buffalo and 360 NW. of New York.

The river has here three perpendicular falls of 96, 26, and 83 feet, and affords immense water-power. The city is well built, and laid out with almost unbroken regularity. Among the principal buildings are the city hall, of blue limestone, and the court-house; a state industrial school (formerly a 'house of refuge'), with accommodation for 500 boys and 200 girls; numerous churches, including a Roman Catholic cathedral; the Free Academy, and the university (founded 1850, and under Baptist control), and a Baptist theological seminary (whose library of 21,000 vols. includes that of Neander). There are also over thirty graded public and many private schools, libraries, asylums, hospitals, &c. But the most noteworthy structure in the city is the handsome stone aqueduct of seven arches (850 feet long) by which the Erie Canal crosses the river. The principal industries are flour-milling, which has always been extensively carried on here, and the manufacture of ready-made clothing and boots and shoes, rubber goods, furniture, carriages, agricultural implements and machinery, steam-engines, glass, cigars, tobacco, perfumery, &c.; and there are besides numerous foundries, iron-bridge works, cotton-mills, breweries, and fruit-canning establishments. In the neighbourhood there are great nurseries, and in the city large seed-packing establishments. Rochester is a port of entry, and has a considerable trade both by lake and rail. It was settled in 1810, incorporated in 1834, and in 1890 was, in order of population, the twenty-second city of the United States. Pop. (1840) 20,191; (1860) 48,204; (1880) 89,366; (1890) 133,896.—(2) Capital of Olmsted county, Minnesota, on the Zumbro River (crossed by three iron bridges), 347 miles by rail NW. of Chicago. It has flour-mills, foundries, and manufactories of furniture, farming implements, &c. Pop. (1891) 5321.—(3) A town of New Hampshire, 22 miles by rail NW. of Portsmouth, with manufactures of flannel, blankets, shoes, &c. Pop. 7113.—(4) A borough of Pennsylvania, on the north bank of the Ohio, at the mouth of the Beaver River, 25 miles by rail NW. of Pittsburgh, with manufactures of coffins, carriages, tumblers, &c. Pop. 3635.

Rochester, John Wilmot, Earl of, the wittiest reprobate at the court of Charles II., was born at Ditchley in Oxfordshire, 10th April 1647, and was educated at Burford school and Wadham College, Oxford. He next travelled in France and Italy, and on his return repaired to court, where his handsome person and lively wit quickly made him a prominent figure. In 1665 he showed conspicuous courage serving under Sandwich against the Dutch, as well as the summer after under Sir Edward Spragge—facts which agree but ill with the stories that he would slink away in street quarrels and evade duels which he had himself provoked. With a friend, Mr Windham, he had entered into a formal engagement that, 'if either of them died, he should appear and give the other notice of the future state, if there was any.' Windham was killed in an attack upon Bergen, but did not afterwards disturb the rest of his friend, who now plunged into a life of the grossest debauchery, was for five years together continually drunk, and diverted himself constantly with extravagant frolics and buffoonery, such as the pursuit of low amours in mean disguises, and the acting of assumed characters, as a mountebank, a quack doctor, and the like. In the scarce intervals of intemperance he wrote excellent letters to his wife and son, and devoted himself to letters, writing personal satires, bacchanalian and amatory songs, and too often obscene and licentious verses, many of which, however, were doubtless fathered on him after his day. In these wild excesses he blazed out his youth and his health, till at the age of one and thirty he had exhausted the fund of life. On his death-bed he was convinced of the necessity of repentance by the arguments of Bishop Burnet, who writes: 'I do verily believe he was so entirely changed, that if he had recovered he would have made good all his resolutions.' He died 26th July 1680. His last conversations are touchingly described by Burnet in *Some passages of the Life and Death of John, Earl of Rochester* (1680; in vol. iv. of Wordsworth's *Ecclesiastical Biography*), a book, says Dr Johnson, 'which the critic ought to read for its elegance, the philosopher for its arguments, and the saint for its piety. It were an injury to the reader to offer him an abridgment.'

Rochester's verses show more wit than poetry, but he possessed in rich measure the gift of satire. An excellent example of this is his memorable epitaph on Charles II.:

> Here lies our sovereign lord the king,
> Whose word no man relies on;
> He never said a foolish thing,
> Nor ever did a wise one.

Equally well known is the description—'a merry monarch, scandalous and poor,' the line rhyming with which it is characteristically impossible to quote. Horace Walpole's judgment of his work is thus expressed in *Royal and Noble Authors:* 'Lord Rochester's poems have much more obscenity than wit, more wit than poetry, more poetry than politeness.' Before his death he expressed a wish that his indecent verses should be suppressed, but that very year these, and much more, were published ostensibly at Antwerp, really at London. Among the best of his poems known to be genuine are an Imitation of Horace on Lucilius, Verses to Lord Mulgrave, a Satire against Man, and Verses upon Nothing.

Rochester, Viscount. See Ker, and Overbury.

Roche-sur-Yon, capital of the French department of Vendée, on the Yon, 50 miles SSE. of Nantes by rail, has a prefecture, lyceum, library of 12,000 volumes, a museum, and a theatre. Napoleon selected it in 1805—then a mere village—to be the departmental capital. From 1815 to 1848 it was called *Bourbon-Vendée*, from 1848 to 1870 *Napoléon-Vendée*. Pop. 8789.

Rochet (Low Lat. *rochettus;* Old High Ger. *roech*, 'coat;' Ger. *rock*), a fine linen or lawn vestment proper to bishops and abbots, and worn also by canons of certain privileged chapters, and some other dignitaries. It is of the form of a surplice, but with sleeves fastened at the wrist; these formerly fitted more tightly to the arm than do the 'balloon sleeves' still commonly worn by Anglican bishops. In the Latin Church its use is very ancient. Formerly it appears to have been worn by clerics serving mass and by priests baptising, because it left their arms free (Lyndwood, quoted by Du Cange); but those priests who are privileged to wear the rochet are now commanded to regard it as a choir vestment, and are strictly forbidden to use it in the administration of the sacraments. In the First Prayer-book of Edward VI. the rochet was ordered to be worn by bishops at all public ministrations, and beside—i.e. over it—a surplice or alb. It is prescribed in the present Book of Common Prayer as part of the episcopal habit. The old 18th-century Anglican fashion of fastening the sleeves of the rochet to the chimere—leaving the rochet itself sleeveless—is almost gone out.

Rock. Though popularly restricted to masses of indurated matter, this term is extended by geologists to all substances which make up the crust of the earth, whether they be loose and friable like soil and sand, or compact and indurated like limestone and granite. The rocks of the earth's

crust (aqueous, igneous, metamorphic, &c.) will be found described under numerous distinct headings in this work. See the classification given at PETROGRAPHY, and the article GEOLOGY, with the list appended, including such articles as DENUDATION. See also BUILDING STONE, BLASTING, BORING.

Rockall (in old maps *Rocol*, *Rochol*, &c.), on a deeply covered sandbank in the Atlantic 50 miles long and 25 broad, in 57° 36′ N. lat., 13° 42′ W. long., 160 miles W. of St Kilda, 290 from the nearest point of the Scottish mainland, and 260 from the north of Ireland. It is an isolated conical granitic rock on stratified masses, rising 70 feet above the sea, and about 100 yards in circumference. At a distance it looks like a ship in full sail, the upper part being white with the dung of sea-fowl, and the lower part dark stone. This curious peak is further from a mainland than any other rock or islet of like size in any part of the world. Martin, in his *St Kilda* (1698), mentions that a crew of Frenchmen and Spaniards, shipwrecked at Rockall in 1686, escaped in their pinnace to St Kilda. The first landing known was in 1810. Vessels come hither for cod-fishing from Scotland and from Grimsby.

See the account of a scientific expedition hither in 1896 in an article by Mr Miller Christy in the *Royal Scottish Geographical Magazine* for 1898.

Rock-basins, a name given by Sir Andrew Ramsay to lacustrine hollows in rock which have been excavated by glacier-ice. See LAKE.

Rock-butter, an impure alum efflorescence of a butter-like consistency found oozing from some alum slates.

Rock-crystal. See QUARTZ.

Rocket is a cylindrical case of paper or metal partially filled with an inflammable composition (saltpetre 68 parts, sulphur 12 parts, charcoal, or mealed powder, 32 parts), so that a large conical hollow is left inside. The base is open or has vents in it, and the head closed. On being ignited this composition burning over the whole surface of the hollow portion at once causes a great rush of gas out of the base, thus driving the rocket forward with great and increasing velocity. Rockets are used for signalling and to carry a light line for life-saving purposes (see LIFE-SAVING APPARATUS). Early in the 19th century they began also to be used in war. Sir William Congreve in 1808 introduced iron war-rockets up to 24 lb. in weight, with thick iron heads adapted to act like a shell. They were fired from a tube and steadied in their flight by means of long sticks. In the more modern Hale rocket a rotatory motion is given by causing the gas to pass out of vents in the base bored between three projecting shields, shaped somewhat like the blades of a screw-propeller, against which it presses. The cumbrous stick is therefore no longer used, and the rocket is fired from a low trough with tripod stand, or even from the ground, by raising the head to the height necessary to give the required range, which may be as much as 4000 yards. Though extremely portable as compared with other missile weapons of similar power, rockets are so uncertain in their flight that they are not much used, except for incendiary purposes and against savages, who greatly dread them. Against cavalry they would be very useful if they could be depended on. The rocket troop of the Royal Horse Artillery did very good service in the Peninsular war, however, and ships' boats, which could not carry a gun firing a 24-pounder shell, can throw rockets of that weight into a place under bombardment. See PYROTECHNY.

Rocket, a name given to a number of plants of the natural order Cruciferæ, and belonging to the genera Brassica, Sisymbrium, Erysimum, Barbarea, Hesperis, &c. Garden Rocket (*Brassica Eruca*, or *Eruca sativa*) is an annual plant, a native of Austria, with stem 2 feet high, upright and branching; the leaves smooth, succulent, cut and toothed. When in flower it has a strong, peculiar, and disagreeable smell; but when it is very young this smell is almost imperceptible, and the leaves are used as a salad, for which it is frequently sown on the continent of Europe, and was formerly cultivated also in Britain. The name Garden Rocket is given also to *Hesperis matronalis*, also called Dame's Violet (q.v.), a favourite ornament of our flower-borders. The Yellow Rocket of our flower-borders is a double-flowered variety of *Barbarea vulgaris* (see CRESS). The Wild Rocket (*Sisymbrium officinale*, or *Erysimum officinale*) is common in Britain, and is sometimes sown and used as a spring potherb.

Rock-fish. See WRASSE.

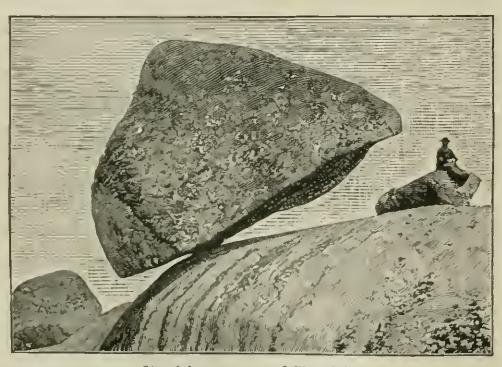
Rockford, capital of Winnebago county, Illinois, is on both sides of the Rock River, 86 miles by rail WNW. of Chicago. It is a well-built town, with shady streets, and contains foundries, flour, paper, cotton, and woollen mills, and numerous manufactories of agricultural implements, carriages, pumps, churns, furniture, cutlery, and plated ware, boots and shoes, watches, soap, &c. Pop. (1880) 13,129; (1890) 23,584.

Rockhampton, a town of Queensland, Australia, situated on the south bank of the Fitzroy, 35 miles from its mouth, and 420 NW. of Brisbane. The town has wide streets, lined with trees, and many substantial buildings, including the government offices, hospital, and town-hall. It owes its beginning (1858) to the extensive gold-fields in the neighbourhood, the annual yield of which is valued at £1,000,000 to £1,250,000; copper and silver are also worked to some extent. The land around is well adapted for grazing. The industries include tanning, soap and boot making, and meat-preserving. The chief port for central Queensland, its trade in exports (one-third) and imports reaches an annual value of £1,500,000. A bridge across the Fitzroy, with five spans of 232 feet each, connects Rockhampton (pop. 7431) with its suburb North Rockhampton (pop. 1700).

Rockingham, CHARLES WATSON WENTWORTH, MARQUIS OF, a statesman of importance beyond his abilities, was born in 1730, the only son of that Thomas Watson Wentworth who succeeded as sixth Lord Rockingham in 1746, and was created marquis the same year. He had his education at Eton, was created Earl of Malton in the Irish peerage in 1750, and succeeded his father as second Marquis of Rockingham in December of the same year. In 1751 he was nominated lord-lieutenant of the North and West Ridings of Yorkshire, and in 1760 made Knight of the Garter, but soon found himself in opposition to the policy of the young king George III. and his favourite minister, Bute, and was dismissed from his lord-lieutenancy in 1762. He found himself leader of the combination of Whig opposition, after the Duke of Devonshire's death in 1764, and in July 1765 was called on to form his first ministry. He repealed the Stamp Act, and would have done more for progress but for the secret intrigues of the court, added to the defection of the Duke of Grafton and his own want of influence in parliament. Rockingham resigned in August 1766, and remained out of office sixteen years in opposition to Lord North and the ruinous policy that lost America. He again became premier in March 1782, with Fox and Shelburne as his secretaries, but died 1st July of the same year. See the *Memoirs* by the Earl of Albemarle (2 vols. 1852).

Rocking-stones, or LOGANS, are large masses of rock so finely poised as to move backwards and forwards with the slightest impulse. They occur in nearly every country. Some of them appear to be natural, others artificial; the latter seem to have been formed by cutting away a mass of rock round the centre-point of its base. The former are chiefly granitic rocks, in which felspar is abundantly present; for, this mineral being readily decomposed, the rock becomes disintegrated to grit, sand, and dust, which are carried away by rains and wind, so that what was formerly a solid rock soon assumes the appearance of a group of irregularly-shaped pillars, separated into portions by horizontal and vertical fissures. As decay proceeds, the edges of the blocks forming the pillar are first attacked and disappear, and the pillar now becomes a pile of two or more spheroidal rocks, resting one upon the other. Should a mass of rock be so situated as to preserve its equilibrium in spite of the gradual diminution of its base or point of support, a rocking-stone or logan is the result. Although rocking-stones are most frequently of a granitic nature, they occur also among basalts and other crystalline igneous masses. For the principle regulating the stability of equilibrium of rocking-stones, see STABILITY. Various explanations have been given of the uses of these singular objects. They are supposed to have been used in very early times for purposes of divination, the number of vibrations determining the oracle; hence it came to be believed that sanctity was acquired by walking round them.

Some rocking-stones occur near to remains of ancient fortifications, which seems to bear out a statement in one of the poems of Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece rocking-stones occur as funeral monuments, and are generally found on conspicuous places near the sea. Rocking-stones are numerous in Yorkshire, Derbyshire, Cornwall, and Wales. The famous Logan Rock, near Land's End, in Cornwall, is computed to weigh over 70 tons. It was wantonly displaced in 1824 by Lieutenant Goldsmith, R.N., and his boat's crew of nine men. He had to replace it at a cost to himself of £2000; but whether it has since rocked as well as ever is a moot point. Near Warton Crag, Lancashire, are no less than seven of these stones; and in Scotland they occur in the



Rocking-stone of Tandil.

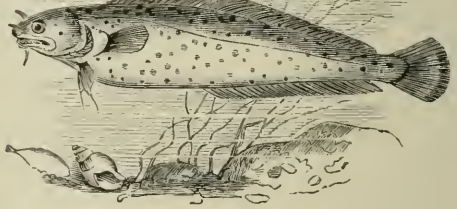
parishes of Kirkmichael, Dron, and Abernethy, Perthshire, and Kells, Kirkcudbrightshire. In Ireland they are found in many places; one situated at a place called Islandmagee, on Brown's Bay, County Antrim, is popularly believed to acquire a rocking tremulous motion at the approach of sinners and malefactors. At Andafiord (Faroe Islands) a large block of basalt, measuring some 16 feet in length by 10 feet in breadth, and rising for about 10 feet out of the water, swings to and fro with the motion of the sea, which is about seven fathoms deep. All these, however, are as marbles compared with the rocking-stone of Tandil in the Argentine Republic, 250 miles S. of Buenos Ayres, for this weighs over 700 tons, yet is so nicely poised that it rocks in the wind, and may be made to crack a walnut. See Frank Vincent's *Around and About South America* (1890), from which our illustration is copied.

Rock Island, capital of a county of that name in Illinois, on the Mississippi, opposite Davenport, Iowa (the two are connected by a wrought-iron bridge which cost $1,300,000), 181 miles by rail WSW. of Chicago. The island from which the town is named belongs to the United States, and is used as a public park; on it the government has erected a great arsenal and armoury. The channel to the east of the island has been dammed so as to furnish immense water-power, and the city has flour and saw mills, besides foundries, machine-shops, glass-works, &c. Pop. (1880) 11,659; (1890) 13,634.

Rockland, (1) capital of Knox county, Maine, on the west side of Penobscot Bay, 88 miles by rail ENE. of Portland. The Boston and Bangor steamboats touch here. The city has granite quarries, and many lime-kilns; it ships a million casks of lime yearly, and the New York post-office and St Louis custom-house are among the structures built of its granite. Shipbuilding is carried on, and there are iron and brass foundries, &c. Pop. (1890) 8174.—(2) Rockland, Massachusetts, 19 miles by rail SSE. of Boston, contains large boot and shoe factories, and a pop. (1890) of 5206.

Rockland Lake, near the Hudson, 30 miles N. of New York City, is 3 miles in circumference, and furnishes 200,000 tons of ice annually.

Rockling (*Onus*), a genus of fishes of the Cod family Gadidæ, represented on the British coasts by several species distinguished among other things by the number (3–5) of barbels. The larger species



Three-bearded Rockling or Sea Loach.

reach a length of 17 inches; but none are of any value as food, their flesh acquiring an unpleasant smell a few hours after being taken out of the water.

Rock-oil. See PETROLEUM.

Rock-plants, in Gardening, a term applied to a very miscellaneous group of plants, which by their habit of growth are adapted to adorn rockeries. The plants are generally of lowly habit, either tufted, creeping, or trailing. They may be shrubby or herbaceous perennials, and certain annuals of trailing habit are occasionally used for temporary effects. But the more restricted use of the term comprehends merely the numerous species of ALPINE PLANTS (q.v.) and such as resemble these in their habit and adaptability to the purpose in view—the clothing of rock-work with verdure and

with flowers in imitation of the natural conditions in which the Alpine flora appears in Alpine regions and in high latitudes.

Rock River rises in the south-eastern portion of Wisconsin, and flows south into Illinois, thence south-west, and empties itself into the Mississippi 3 miles below Rock Island. Its course of 375 miles, much broken by falls, is through a region noted for its beauty and fertility.

Rock-rose. See CISTUS.

Rock-salt. See SALT.

Rock-soap, a mineral consisting of silica, alumina, peroxide of iron, and water, the silica nearly one-half, the alumina and the water sometimes nearly each one-fourth of the whole. It is earthy, easily broken, black or nearly so, very soft, and easily cut with a knife, is greasy to the touch, and adheres strongly to the tongue. It is valued by painters for crayons. It is found in Poland, Thuringia, and Bohemia, and occurs in basaltic rocks in the Isle of Skye and Antrim, in the form of nodules of a greenish-gray or brown colour. It is only found massive.

Rock-temples. In many parts of Western India, as at Ellora, Elephanta, Karli, and Salsette Island, natural rocks have been cut into temples; as also into caves and forts (see the articles mentioned). Out of India well-known instances of the same kind occur at Petra (q.v.) in the Arabian Desert, at Abu-Simbel (q.v.) in Egypt, and in China and Siam. There are remarkable cave-temples in the United States, one in Missouri, between the Salt River and Otter Creek, and another near Manchester in Ohio. The rock-dwellings of Colorado, &c., are described at CAVE. See James Fergusson, *Rock-cut Temples of India* (1864), with seventy-four photographs by Major Gill.

Rocky Mountain Goat (*Aplocerus*), a beautiful animal of the antelope family, which inhabits the heights of the Rocky Mountains between the forests and the snow-line, from the 44th to the 65th degree of latitude. It is about the size of a goat, but is handsomer and more thickset, and has stronger legs. It is completely covered with long, thick, white hair, which forms an erect mane along the middle of the back from between the horns to the root of the tail. Though it is hunted by the trappers, its flesh is not valued as food. The above species and the Prong-horned antelope (*Antilocapra*) are the only antelopes which occur in the New World.—For the Rocky Mountain Sheep, see ARGALI, SHEEP.

Rocky Mountains, a name formerly somewhat loosely applied to all the mountains of North America between the Great Plains and the Pacific Ocean, is a term now used to designate only the eastern ranges of the great Cordilleran system. This vast mountain-system acquires its greatest breadth within the limits of the United States, where between the parallels 38° and 42° N. lat. it attains a width of more than 1000 miles. Toward the north and the south the plateaus of this highland gradually diminish in breadth, but they are enclosed on the east and on the west by high mountain-chains. Those forming the western boundary are the Sierra Nevada and the Cascade Ranges (q.v.), and the eastern chains stretching with uninterrupted continuity from the southern borders of the United States through the Dominion of Canada to the Arctic Ocean constitute the Rocky Mountains. Between these eastern and western boundaries the plateau region is greatly diversified by chains which, as a rule, trend in the same general direction as the border ranges.

Copyright 1891 in U.S. by J. B. Lippincott Company.

The name 'Rocky Mountains' is peculiarly appropriate, as there probably exists nowhere else such an extensive region of naked rock almost entirely devoid of vegetation. The geological structure is complex, but the greater part of the rocks exposed are Mesozoic intermingled with Tertiary and Quaternary deposits. As this system is consequently of much more recent origin than the Appalachians, it is naturally higher, and it presents also a sharper and more rugged outline. Its remarkably barren aspect is due also to other geological peculiarities and to climatic causes. In comparatively recent ages this whole region has been the scene of vast volcanic eruptions, and the lava overflows which have covered the stratified rocks in many places to a depth of thousands of feet have augmented the expanse of sterile surface. By resisting the erosion of the streams and of the atmosphere, these lava beds have also greatly aided in producing the precipitous and deeply furrowed watercourses by which this wonderful plateau region is traversed. The high mountain barrier at the western boundary of the highland robs the winds which sweep across the Pacific of much of their moisture, and the great aridity of this region thus prevents the growth of vegetation. The surface is consequently exposed to continued erosive action, which is specially rapid at such great elevations. The denudation is the more complete as the sand and smaller disintegrated fragments are swept away by the winds, and no opportunity is afforded for the accumulation of a soil. On account of these various causes the erosion of the surface is uneven, and the region displays a labyrinth of naked crags and peaks arising from plateaus crossed by towering cliffs or deep cañons, with here and there an isolated butte. The scenery of the wonderful *mesa* or plateau region which lies between the eastern and western ranges of the Rocky Mountains, and extends from southern Wyoming through western Colorado, eastern Utah, and south into New Mexico and Arizona, is unequalled by that of any other portion of the globe. The country is divided by faults, flexures, and deep cañons into numerous blocks or separate plateaus, and the wonderful carving of the rocks and the brilliant colouring of the exposed strata almost surpass belief.

A high plateau region in Wyoming, over which passes the Union Pacific Railroad, marks a separation of the Rocky Mountains into a northern and a southern group, each of which has its characteristic features. The continental divide which extends north and south with the ranges of the Rocky Mountains culminates in this plateau, where are found the extreme head-waters of the three great river-systems of the United States—the Mississippi, the Columbia, and the Colorado. The ranges of the southern group have a general north and south trend, and are higher than those of the northern group. As there are several elevated valleys known as 'Parks' enclosed between the parallel ranges, this group is sometimes known as the Park System. It extends southward from the Laramie Plains across central Colorado into New Mexico. Its greatest development is in Colorado, where there are nearly forty peaks each over 14,000 feet in height. The Medicine Bow Range and the Colorado or Front Range form the eastern edge of the Rocky Mountain System, and rise abruptly from the gentler slope of the Plains. In this range are the well-known landmarks, Long's Peak (14,271 feet) and Pike's Peak (14,134 feet), as well as Gray's Peak (14,341 feet), its highest point, which is too far west to be visible from the Plains. This range forms the eastern wall of North, Middle, and South Parks, and the Park Range constitutes their western boundary. To the west of the southern end of the Park Range lies the Sawatch Range,

with the famous Mount of the Holy Cross (14,176 feet) and Mount Harvard (14,375 feet). Farther south are the San Juan Mountains, which constitute the western boundary of San Luis Park. To the north and west of this range lies a high broken country merging into the *mesa* region of western Colorado. Uncompaligre Peak (14,408 feet) is the culminating point of this section. The eastern border of San Luis Park is formed by the Sangre de Cristo Range, which is almost a continuation of the Sawatch. Its loftiest summit, Blanca Peak (14,463 feet), is the highest point of the 'Rockies.' The Elk Mountains, a series of short parallel ranges with sharp volcanic peaks, lie to the west of the Sawatch Range. In the Parks rise the head-waters of the North and the South Platte, the Arkansas, the Grand, and the Rio Grande. Beside these large parks there are among these ranges many smaller but beautiful valleys. West of the Park Range are the Uintah Mountains, composed of a broad fold of thick strata, of which the Upper Tertiary and Cretaceous layers have been eroded to the depth of more than 3 miles, exposing the underlying Carboniferous rocks. This range has an east and west trend, and connects the eastern and western ranges of the Rocky Mountain System. The most important of the western ranges are the Wahsatch Mountains, which form a part of the eastern rim of the Great Basin (q.v.), and which serve as the connecting link between the northern and southern groups of this system. The greatest development of the northern group is in Wyoming. The Wind River Mountains are the highest of the ranges, with Fremont's Peak (13,790 feet) as the culminating point. To the west are the Tetons, Mount Hayden (13,691 feet), and the Snake River Mountains. The mountains of the northern group are wilder and less accessible than those of the southern chains, but not so high. They also present scenery which is less varied; they are not so definitely marked by regular ranges, and there are but few prominent peaks except in the groups already mentioned and in the geyser region of the Yellowstone. In Idaho and Montana there are numerous enclosed mountain valleys, which are called 'Parks' or 'Prairies,' but they are not so high as the 'Parks' of Colorado. The Bitter Root Mountains form the divide between the head-waters of the Missouri and those of the Columbia, and also between the tributaries of Clarke's Fork and of the Snake River. The Lapwai and Cœur d'Alene ranges, which lie to the west and northwest, connect the Rocky Mountains with the Blue Mountains, and between these groups and the Cascade Range are the Great Plains of the Columbia River. Yellowstone Park (q.v.), in the northwestern part of Wyoming, is famous for its hot springs, geysers, mud volcanoes, and its wonderful scenery. The disposition of the mountains toward the east is peculiar, as they occur in more or less detached and isolated groups, among which are the Crazy Mountains, Judith Mountains, and the Big Horn Mountains. Still farther east are the Black Hills, completely detached from the main system, and noted for their mineral wealth. Beyond the Canadian line too little is known of the Rocky Mountains to warrant a detailed description. Mount Hooker and Mount Brown seem not to be 15,000 feet but little over 9000 feet high. The highland gradually descends towards the north, reaching an elevation of about 800 feet in the vicinity of the Arctic Ocean, and the northern ranges form the divide between the head-waters of the Mackenzie and the Yukon Rivers.

Rococo, or ROCAILLE, a name given to the very debased style of architecture and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. The ornament consists of panels with their mouldings broken or curved at the angles, and filled with leafage, shell-work, musical instruments, marks, &c. This style prevailed in Germany and Belgium during the 18th century,

Rococo Ornament.

and in France from the time of Henry IV. to the Revolution. The illustration shows an example from an altar in the church of St James, Antwerp.

Rocroi, a third-class fortress of France, department Ardennes, 24 miles NW. of Sedan, and 2 from the Belgian frontier. It is situated in the forest of Ardennes. Pop. 1781. Here the Great Condé (q.v.) broke the reputation of invincibility long enjoyed by the Spanish infantry, May 19, 1643.

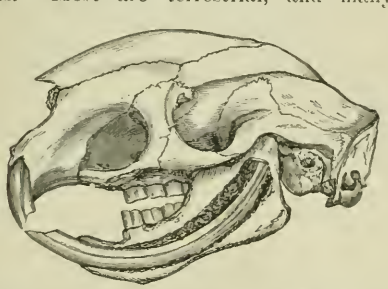
Rod, called also a *pole*, or *perch*, a measure of length, equivalent to $5\frac{1}{2}$ yards, or $16\frac{1}{2}$ feet. The square rod, called generally a *rood*, is employed in estimating masonry-work, and contains $16\frac{1}{2} \times 16\frac{1}{2}$, or $272\frac{1}{4}$ square feet.

Rodbertus, JOHANN KARL, designated the founder of scientific socialism, was born the son of a professor at Greifswald on 12th August 1805, and studied law at Göttingen and Berlin. For a few years he held law appointments under the Prussian government, but in 1836 settled down on his country estate at Jagetzow in Pomerania, and turned his attention chiefly to economic studies. In 1848 he was elected a member of the Prussian National Assembly, and for a fortnight filled the post of minister of Worship and Education; in the following year he carried the adoption of the Frankfort constitution for the empire, but retired from public life when the Prussian electors were grouped in three separate classes. He died on 6th December 1875. Although a socialist, Rodbertus was not a demagogic agitator: he believed that the socialistic ideal will work itself out gradually according to the natural laws of change and progress. Indeed he fixed upon five centuries as the time it will take to educate the people, the democracy, up to the socialistic ideal. When that ideal is realised the state will be the owner of all the land and capital of a country, and will superintend the distribution of the total products of human labour amongst those who do the labour, apportioning to each a share corresponding to his work. (His fundamental economic principle was of course that labour is the true and only source of wealth.) In the meantime he would not interfere with the working of the established laws of capital and land, nor with the principles of monarchical government. On behalf of the workers he advocated that the government should fix a normal working-day,

a normal day's work, and a maximum and minimum of wages. His views are laid down in *Zur Kenntniss unserer staatswirthschaftlichen Zustände* (1842), *Soziale Briefe* (1850–51 and 1884), *Zur Erklärung der Kreditnot des Grundbesitzes* (1868–69), 'Der Normalarbeitstag' and other papers in *Tübinger Zeitschrift* (1878 *et seq.*), and others in *Jahrbücher für Nationalökonomie*.

His *Briefe und Aufsätze* were edited by R. Meyer (2 vols. 1882), and his *Kleinere Schriften* by M. Wirth (Berlin, 1890). See monographs by R. Adler (1884) and Dietzel (1886–88). See also SOCIALISM.

Rodentia (Lat. 'gnawers'), an order of Mammals more rich in species than any of the others, including among its familiar representatives squirrels, marmots, beavers, rats and mice, lemmings, porcupines, guinea-pigs, hares and rabbits. Most are terrestrial, and many are



Skull of Common Porcupine (*Hystrix cristata*): The lower jaw partly in section to show the lower incisor tooth.

burrowers, but a few are arboreal or even semi-aquatic. All are vegetarian, and gnaw their food. They are represented in all parts of the world.

Among the anatomical characteristics of Rodents may be noted the chisel-like edge of the incisor teeth, which wear away in front less rapidly than they do behind, where the enamel coating is thinner or absent; the reduction of the incisors to two above and two below, except in the hares and rabbits, in which there are four above; the fact that the incisors and sometimes the back teeth also are rootless, and continue growing from persistent pulps: the absence of canine teeth, and the presence of a large space between incisors and premolars; the condyle in which the lower jaw works is elongated from before backwards—an adaptation to the peculiar motion of the lower jaw characteristic of rodent gnawing; the cerebral hemispheres are smooth, and leave the cerebellum uncovered; the intestine, as in many herbivorous animals, has a large cæcum; the uterus is two-horned, the placentation discoidal and deciduate; the reproduction is in many cases very prolific.

Classification.—Sub-order Simplicidentata—with only one pair of upper incisors, having enamel only in front. This sub-order includes squirrels (Sciurus), flying squirrels (Pteromys and Sciuropterus), marmots (Arctomys), beavers (Castor), dormice (Myoxidæ), rats and mice, voles, lemmings, musk-rats (Muridæ), pouched-rats (Geomyidæ), the capybara (Hydrochærus), porcupines (Hystricidæ), agoutis (Dasyprocta), guinea-pigs (Cavia). Sub-order Duplicidentata—with two pairs of incisors in the upper jaw, the second pair behind the first, the enamel extending round the teeth, but thinner posteriorly. This sub-order includes only the Picas or tailless hares (Lagomys) and the hares and rabbits (Lepus).

See Waterhouse, *Natural History of the Mammalia*, vol ii. 'Rodentia' (1848); Flower and Lydekker, *Mammals, Living and Extinct* (Lond. 1891).

Roderic, 'the last of the Goths,' whose tragic death, coincident with the downfall of the Visigothic monarchy in Spain, has inspired poets and romancers (Scott, Southey, Geibel, Dahn) to throw round him a halo of glory. Next to nothing authentic is known about him; but according to the commonly accepted legend, he was the son of a noble who was blinded by King Witiza. A conspiracy having been formed against the hated Witiza by the clergy and the nobles of Roman blood, Roderic was elevated to the throne (710). The sons of Witiza, however, bided their time, meanwhile submitting to the usurper. At length certain malcontent nobles were engaged in a plot to dethrone Roderic by Count Julian, the governor of Centa (in North Africa), whose daughter had been outraged by the Visigothic king. Julian brought over with him a Moorish chief named Tarik at the head of 12,000 men. Roderic met the invading army on the banks of the Guadalete, near Xeres de la Frontera, on 26th July 711. The battle raged six days; but the sons of Witiza, who commanded the wings of the Christian army, deserted during the contest, and the rout of the Visigoths was complete. Roderic either died on the field or was drowned in the Guadalete, whilst attempting to swim his horse across. A third version, however, relates that he escaped and passed the rest of his life as a pious hermit. By this victory the Arabs became masters of southern Spain.

Rodez, a town of southern France (dept. Aveyron), stands on a bold bluff encircled by the Aveyron, 148 miles by rail NW. of Montpellier. The Gothic cathedral (1277–1535) has a tower, 260 feet high, crowned by a colossal image of the Virgin. There are several mediæval houses, remains of a Roman amphitheatre, and a restored Roman aqueduct. Coal-mining, cloth-making, tanning, and cattle-dealing are the principal occupations. Pop. (1872) 12,111; (1891) 15,295.

Rodgers, JOHN, American naval officer, was born in Maryland, 11th July 1771, the son of a Scotch colonel of militia. He was a captain in the merchant service by 1789, and in 1798 entered the navy. In 1805 he extorted from Tripoli and from Tunis treaties abolishing blackmail and forbidding the slavery of Christian captives. On 23d June 1812 he fired with his own hand the first shot in the war with Britain, and during the war he took twenty-three prizes. He died 1st August 1838.—His son, JOHN RODGERS (1812–82), a captain in the navy, captured a Confederate ironclad, and rose to be rear-admiral (1869), and superintendent of the United States naval observatory (1877).

Rodin, AUGUSTE, the foremost of contemporary French sculptors, was born at Paris in 1840, studied under Barye, and began to exhibit in the Salon in 1875. He has produced great scriptural and symbolical groups, but is best known by his portrait busts and statues, notably the bust and the monument of Victor Hugo. See Monkhouse in the *Portfolio* (1887); and Brownell, *French Art* (1894).

Rodman, THOMAS JEFFERSON (1815–71), an American soldier, inventor of a method of casting cannon. See Vol. II. p. 714.

Rodney, GEORGE BRYDGES RODNEY, LORD, English admiral, born 19th February 1719, was the second son of Henry Rodney, a cadet of an ancient Somersetshire family, the elder branch of which had merged in that of Brydges, and was at this time represented by the first Duke of Chandos. Henry Rodney served for a few years as cornet of horse in the wars of William III. and Anne, and afterwards, settling at Walton-on-Thames, obtained an appointment under George I. as commander of one of the royal yachts. In this capacity he was noticed by the king, who offered to stand as godfather to his second son. The Duke of Chandos was the other godfather, and after the two the boy

was christened George Brydges. He received his early education at Harrow, which he quitted at the age of twelve to enter the navy as a 'king's letter boy.' After serving chiefly on the Newfoundland station he was made a lieutenant in 1739 in the Mediterranean; in 1742 he was promoted by Admiral Mathews to be post-captain, and was sent home in command of the *Plymouth*, a 64-gun ship. He afterwards successively commanded the *Sheerness*, *Ludlow Castle*, and *Centurion*, and in 1747 the *Eagle*, in which he had a brilliant share in Hawke's victory over L'Etenduère on 14th October. In 1748 Rodney went out in the *Rainbow* as governor of Newfoundland and commander-in-chief on that station, where he remained till 1752; in 1753 he commanded the *Fougueux*, and from 1754 to 1757 the *Prince George*. He was then appointed to the *Dublin*, one of the fleet under Sir Edward Hawke in the futile expedition against Rochefort, and in 1758 under Boscawen at the capture of Louisburg. In May 1759 Rodney was promoted to be rear-admiral, and in July commanded the small squadron which bombarded Havre and destroyed the flotilla of flat-bottomed boats collected for the proposed invasion of England. In October 1761 he was appointed commander-in-chief on the Leeward Islands station, where in the early part of 1762, in co-operation with the land forces, he captured Martinique, St Lucia, and Grenada. In October he was promoted to be vice-admiral, and returning to England in August 1763 was created a baronet, 21st January 1764. In November 1765 he was appointed governor of Greenwich Hospital, but in 1771 was recalled to active service, was promoted to be admiral, nominated rear-admiral of Great Britain, and sent out as commander-in-chief at Jamaica. He hoped that he might succeed to the office of governor, which became vacant in 1773; but in his command he had shown an independence which was distasteful to Lord Sandwich, and his application was unsuccessful. In 1774 he returned to England, and for the next five years was left on half-pay, in very embarrassed circumstances, which compelled him to retire to France. It was not till October 1779 that he was again appointed commander-in-chief at the Leeward Islands, and on 29th December he put to sea with, in addition to the West Indian ships, a powerful squadron and a large convoy of store-ships for the relief of Gibraltar, then besieged by the Spaniards. On 9th January 1780, when broad off Cape Finisterre, he fell in with a convoy of Spanish store-ships under the escort of a 64-gun ship, all of which he captured. Passing Cape St Vincent on the 16th he met the Spanish squadron under Don Juan de Langara, which he attacked with a dash and vigour that carried everything before him. Seven ships out of eleven were taken or destroyed; the others managed to escape into Cadiz. Gibraltar was thus relieved without further difficulty than was caused by the weather; and on 13th February Rodney sailed for the West Indies. He had scarcely reached St Lucia, which he made his headquarters, when he had intelligence that the French fleet under the Count de Guichen had put to sea from Martinique. He immediately followed, and overtaking it on the 17th April fought an action in which, in despite of the fighting instructions, he attempted to concentrate his force on the rear of the enemy's line. Unfortunately his signals were not sufficiently clear, the flag-officers and captains did not understand what was proposed, and the clever attempt resulted in comparative failure. During the following May he again twice met De Guichen, but without being able to bring him to a decisive engagement. In November he was nominated a K.B.; and in January 1781, in obedience to special orders from home, he seized on St Eustatia and the other Dutch settlements; but his health having broken down he was compelled to return to England a few months later. In December 1781 he again sailed for the West Indies; and, as before, shortly after arriving at St Lucia he had intelligence of the French fleet, under Count de Grasse, having sailed, with some 5000 troops on board, for Cape François, where it was to join a strong Spanish fleet for an attack on Jamaica. Abreast of Dominica Rodney came in sight of it, and, after an indecisive skirmish on the 9th April, had the good fortune, on the 12th April 1782, to bring it to close action; and being enabled, by the varying nature of the wind, to pass through the enemy's line, he gained a brilliant victory, rendered still more crushing by the success of a small squadron detached to look out for stragglers in the Mona Passage. The French loss in killed and wounded was extremely severe, and seven of their ships were captured, one of them being the *Ville de Paris*, with the Count de Grasse himself on board. The victory placed the English on a very different footing in the negotiations which had been already commenced; and the terms finally agreed on were much more favourable than might otherwise have been expected. But before the news reached England Admiral Pigot had been sent out by the new administration to supersede Rodney, who was looked on as a partisan of Lord Sandwich; and though an express was sent to stop Pigot on the way it failed to overtake him. Rodney returned to England, where—though raised to the peerage as Baron Rodney, with a pension of £2000—he was but coldly received by the government. He had no further employment, and was allowed to live in comparative obscurity, which his shattered health perhaps rendered necessary. He died in London on 24th May 1792.

See his Life by General G. B. Mundy (2 vols. 1830), and Hannay's *Rodney* ('Men of Action' series, 1891).

Rodosto (anc. *Rhœdestos*), a town of Turkey, stands on the north shore of the Sea of Marmora, 60 miles W. of Constantinople. It is the seat of a Greek archbishop, contains many mosques, and sends large quantities of fruits and vegetables to the capital. Pop. 18,600, about one-half Greeks.

Rodriguez, or RODRIGUES, a hilly volcanic island (1760 feet), 18 miles long by seven broad, lies 380 miles E. by N. of Mauritius, of which it is a dependency, being one of the Mascarene group. The soil is fertile, and agriculture is the chief occupation. The exports (agricultural produce and fruits) are valued at £6500 annually, the imports at £5100. Hurricanes often cause great damage to the island, which is encircled by a coral-reef. It was discovered by the Portuguese in 1645, and has been a British colony since 1814. The chief port is Port Mathurin. Owing to its isolation this island is particularly interesting to the botanist and the zoologist. Until near the close of the 17th century it was the home of the Solitaire (q.v.), now an extinct bird. Pop. (1890) 1978. See Leguat's voyage thither (Hakluyt Society, 1893).

Roe (*Capreolus caprea*), a small species of deer inhabiting Europe and some parts of western Asia, chiefly in hilly or mountainous regions which are covered with forests or with scattered bushes and heath. It is seldom found in the higher and more naked mountain tracts, the haunt of the stag or red deer. It was once plentiful in Wales and in the hilly parts of England, as well as in the south of Scotland, but is now very rare south of Perthshire. The roe is about 2 feet 3 inches in height at the shoulder. Its weight is about 50 or 60 lb. Its colour is a shining tawny-brown in summer, more dull and grizzled in winter; on the under

surface and around the tail the colour is whitish, but there is considerable variety. The hair is longer than in many deer. The tail is very short, concealed among the hair. The antlers, which are peculiar to the male or *Roebuck*, are 8 or 9 inches long, erect, round, very rough, longitudinally furrowed; having, in mature animals, two or three tines or branches, which, as well as the tip of the horn, are sharp-pointed, so that the antlers form very dangerous weapons. The habits of the roe

Roebuck (*Capreolus caprea*).

are somewhat like those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe with one or two fawns being usually seen together. Contrary to what is usual among deer, the male and female remain attached during life. The voice of the roe-deer, resembling that of a sheep, but shorter and more barking, is often heard through the night. The males are very combative at the breeding season. The roe browses on the tender shoots of trees and bushes as well as on herbage, and is thus very injurious to young woods. It is never very thoroughly tamed, and when partially so is apt to become mischievous, and the male dangerous. The venison is superior to that of the stag, but not equal to that of the fallow-deer. The horns are used for handles of carving-knives and similar articles.

Roe, Edward Payson, American novelist, was born in New Windsor, New York, 7th March 1838. On the completion of his theological studies he became a chaplain in the volunteer service (1862–65), and afterwards pastor of a Presbyterian church at Highland Falls. The great Chicago fire of 1871 furnished him with a subject for his first novel, *Barriers Burned Away* (1872), which proved very successful. He resigned his pastorate and settled at Cornwall-on-the-Hudson in 1874, where he devoted himself to the successful cultivation of literature and of small fruits. Fifteen novels came from his pen, all of which have been reprinted in Britain, and have been widely read on both sides of the Atlantic. The best known are *From Jest to Earnest* (1875), *Near to Nature's Heart* (1876), *Nature's Serial Story* (1884), and *He Fell in Love with his Wife* (1886). He is also the author of *Play and Profit in My Garden* (1873), and *Success with Small Fruits* (1880). He died suddenly, 19th July 1888; by which date the sale of his works had amounted to 750,000 copies.

Roe, Richard. See Doe, John.

Roe, Sir Thomas, diplomatist, was born near Wanstead in Essex about 1568, studied at Oxford, and, after holding court appointments under Elizabeth and James I., was sent as a political agent to the West Indies, Guiana, and Brazil. In 1614 he sat in parliament, but from 1615 to 1618 was ambassador to the Great Mogul Jahangir at Agra. His journal of this mission was partly printed in Purchas and other collections. He was ambassador to the Ottoman Porte in 1621–28, afterwards represented England in Poland, Denmark, and elsewhere, and died in 1644.

Roebuck, John Arthur, English politician, was born at Madras in December 1802, but passed his youth in Canada. Coming to England in 1824, he was in 1831 called to the bar at the Inner Temple, and in 1832 elected as a Radical reformer for Bath to the House of Commons. He represented Sheffield from 1849 to 1868, and again from 1874 till his death on 30th November 1879. The vigorous nature of his political warfare earned him the popular nickname of 'Tear 'em.' His greatest political triumph was the moving of a motion for inquiring into the condition of the army before Sebastopol in January 1855, which he carried by a large majority, causing the fall of the administration of the Earl of Aberdeen. He was appointed chairman of the committee which conducted the inquiry moved for. During the civil war in America he displayed a strong leaning towards the Confederates. He supported the Earl of Beaconsfield's policy during the Eastern crisis in 1877–78, and in 1879 was made a member of the Privy-council. He was the author of a work on the *Colonies of England* (1849), and *The Whig Ministry of 1830* (1852). See his *Life and Letters* by Leader (1897).

Roermond, an old town in the Dutch province of Limburg, at the junction of the Roer and the Maas (Meuse), 29 miles by rail N. by E. of Maestricht. The cathedral (1218) is one of the finest Romanesque churches in the Netherlands. The church of St Christopher contains good paintings by Dutch masters. Principal industries are weaving woollen cloths and cottons and making paper. During the middle ages Roermond was on several occasions besieged and taken; its walls were demolished in 1819. Pop. (1890) 12,039.

Roeskilde, a city on the Danish island of Zealand, is situated at the southern end of the Roeskilder Fjord, 20 miles by rail W. by S. of Copenhagen. In the middle ages this city, founded in 980, was the capital of the Danish kings and the seat of powerful bishops. The cathedral, built in the middle of the 13th century, contains the tombs of most of the kings of Denmark. Here peace was signed between Sweden and Denmark on 8th March 1658.

Roe-stone, a name locally given to those limestones which are formed of small globules like the roe of fishes. It has been translated into the scientific term *Oolite* (q.v.).

Rogation Days, the Monday, Tuesday, and Wednesday before Ascension-day, so called because on these days the Litany (q.v.) is appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasion of public danger or calamity is traceable very early in Christian use; but the fixing of the days before Ascension for the purpose is ascribed to Mamertus, Bishop of Vienne, in the middle of the 5th century. In England the usage dates from perhaps the 7th century; after the Reformation the recitation of the Litany upon these days was discontinued; but a memorial of the old processions long survived in the so-called Perambulation of Parishes (see Bounds, Beating of the).

Roger I., count of Sicily, the youngest of the twelve sons of Tancred de Hauteville of Normandy, was born in that duchy in 1031. When twenty-

seven years of age he joined his famous brother Robert Guiscard (q.v.) in South Italy; but at first he seems to have fought against Robert more than he helped him. At length they became reconciled, and Roger helped Robert to complete the conquest of Calabria. In 1060 Roger was invited to Sicily to fight against the Saracens: he took Messina, and settled a garrison there. Everywhere the Normans were welcomed by the Christians of Sicily as their deliverers from the Moslem yoke, and they won town after town, until in 1071 the Saracen capital, Palermo, was captured. Robert then invested Roger with the countship of Sicily. Count Roger spent the rest of his life, apart from his numerous expeditions undertaken for the support of his brother, in completing the conquest of Sicily, which was finally effected in 1090. Already as early as 1060 Duke Robert had given his brother the half of Calabria, with the title of count. After Robert's death (1085) Roger succeeded to his Italian possessions, and became the head of the Norman power in southern Europe. Pope Urban II. granted him special ecclesiastical privileges, such as the power to appoint the bishops, and made him papal legate of Sicily (1098). Roger died at Mileto, in Calabria, in June 1101. See SICILY.

Roger II., king of Sicily, the second son of Count Roger I., was born in 1097, and by the death of his elder brother Simon in 1105 became count of Sicily. On the death (1127) of Duke William of Apulia, grandson of Robert Guiscard, his duchy passed to Roger, who thereupon proceeded to weld together a strong Norman kingdom in Sicily and South Italy; the Antipope Anacletus crowned him king of Sicily and Italy in 1130. He next added to his dominions the Norman principality of Capua (1136), the duchy of Naples, and the territories of the Abruzzi (1140). In the year prior to this last acquisition he managed to take prisoner Pope Innocent II., with whom he concluded an advantageous bargain: Innocent recognised him as king of Sicily, whilst Roger acknowledged Innocent as pope, gave him his liberty, and held his kingdom as a fief of the holy see. The Byzantine emperor Manuel having insulted Roger's ambassador, Roger's admiral, George of Antioch, ravaged the coasts of Dalmatia and Epirus, took Corfu, and plundered Corinth and Athens (1146). He carried off silk-workers from the Peloponnesus to Sicily, and so introduced that industry into the kingdom. Roger then crossed the Mediterranean (1147) and won a large province from the Saracens in North Africa—Tripolis, Tunis, and Algeria. His court was one of the most magnificent in Europe; he was tolerant to all the creeds of the various peoples under his rule; his government was firm and enlightened; his name a terror to both Greeks and Moslems. Roger died in February 1154, leaving his throne to his incapable son William. See SICILY.

Roger of Wendover (d. 1236), Benedictine prior of St Albans, completed the work of Matthew Paris (q.v.).

Rogers, HENRY, born October 18, 1806, and educated at Highbury College, became a Congregationalist preacher, and was successively professor of English at University College, London, and of Philosophy at Spring-Hill Independent College, Birmingham, and principal of the Lancashire Independent College, Manchester. He contributed a long series of admirable critical and biographical articles to the *Edinburgh Review*. He died in North Wales, August 20, 1877. A selection of these articles was republished (3 vols. 1850–55).

Other books were a Life of John Howe (1836); *The Eclipse of Faith* (1852), an admirable piece of argument, and its *Defence* (1854), in reply to F. W. Newman; *Essay on Thomas Fuller* (1856); *Selections from the Correspondence of R. E. H. Greyson* [anagram of his name] (2 vols. 1857); and *The Superhuman Origin of the Bible*, Congregationalist Lectures (1873).

Rogers, JAMES EDWIN THOROLD, economist, was born at the village of West Meon, Hampshire, in 1823, and educated at King's College, London, and Magdalen Hall, Oxford, graduating with a first-class in 1846. At first an ardent Puseyite, he took orders, but soon returned to Oxford and became a successful 'coach,' and renounced his orders formally, together with Dr Congreve and Leslie Stephen, after the Clerical Disabilities Act of 1870. In 1862 he was elected professor of Political Economy, but made so many enemies by his outspoken zeal for reforms that he was not re-elected in 1868, nor until the death of Bonamy Price in 1888. An advanced Liberal in politics, he represented Southwark, 1880–85, and Bermondsey, 1885–86. He died October 12, 1890. His greatest work is his painful and laborious *History of Agriculture and Prices in England* (8 vols. 1866–93), and its abridgment, *Six Centuries of Work and Wages* (1885). Besides these he wrote a study on Cobden (1873), edited the *Speeches* (1868) and *Public Addresses* of Bright (1879), the *Wealth of Nations* (2 vols. 1880), and the *Collection of Protests of the Lords* [1624–1874] (3 vols. 1875).

Other books are *Education in Oxford* (1861); *Historical Gleanings* (2 series, 1869–70); *The First Nine Years of the Bank of England* (1887); *The Economic Interpretation of History* (1888); and, ed. by his son, *The Industrial and Commercial History of England* (1892).

Rogers, JOHN, the first of the Marian martyrs, was born near Birmingham in 1505, graduated in 1525 from Pembroke Hall, Cambridge, was a London rector (1532–34), and then lived for some years abroad, at Antwerp and Wittenberg, where he embraced the Reformed doctrines. He prepared a revised translation of the Bible (q.v., p. 127), which was published as 'Matthew's Bible' in 1537, and, returning to England in 1548, preached at St Paul's Cross in 1553, just after Queen Mary's accession, against Romanism. After a long imprisonment he was tried as a heretic, and burned at Smithfield on 4th February 1555. See his Life by Colonel J. L. Chester (1861).

Rogers, SAMUEL, the poet, was born at the suburban village of Stoke-Newington on 30th July 1763, the third son in a family of nine. His father, a City banker, was a Whig and dissenter, a member of the congregation of Dr Price (q.v.); his mother, Mary Radford, was the great-granddaughter of Philip Henry. After a private education, at sixteen or seventeen he entered the bank, in 1784 was taken into partnership, and on his father's death in 1793 became head of the firm. His taste for literature and for the company of literary men awoke at an early period, and one day with a friend he had gone to call upon Dr Johnson at his house in Bolt Court, but his courage failed him when his hand was on the knocker. In 1781 he contributed eight short essays to the *Gentleman's Magazine;* next year wrote a comic opera, containing a score of songs; and in 1786 (the year of Burns's first volume) published *An Ode to Superstition, with some other Poems.* In 1792 appeared *The Pleasures of Memory*, on which his poetical fame was chiefly based, and which in 1816 reached a nineteenth edition (more than 23,000 copies). There followed, 'written with laborious slowness,' *An Epistle to a Friend* (Richard Sharp, 1798), the fragmentary *Voyage of Columbus* (1812), *Jacqueline* (1814, bound up with Byron's *Lara*), and the 'inimitable' *Italy* (1822–28). The last, in blank verse, proved a monetary failure; but the loss was recouped by the splendid edition of it and his earlier poems,

brought out at a cost of £15,000 (2 vols. 1830–34), with 114 illustrations by Turner and Stothard.

Meanwhile he had left the old home on Newington Green, and in 1803 (in which year, with £5000 a year, he withdrew from the bank as a sleeping partner) had given up the chambers in the Temple, and settled down finally to bachelor life in his exquisite house, 22 St James's Place, looking into the Green Park. He had had his affairs of the heart, had proposed, indeed, to a daughter of Banks the sculptor. She refused him, and left him free to cultivate his muse and caustic wit, to raise breakfast-giving to a fine art, to make little tours at home and on the Continent, and to gather an art-collection which sold at his death for £50,000. With Rogers one cannot help harping upon money, for he was rich as no poet perhaps before or after him. At least he made a good use of his riches, for he was quietly generous to Moore and Campbell, and others, unknown ones, whom it was no such credit to have aided. But with the kindest heart he had the unkindest tongue. 'I have a very weak voice,' he explained once to Sir Henry Taylor; 'if I did not say ill-natured things no one would hear me.' With which, however, Campbell's saying should be coupled: 'Borrow five hundred pounds of Rogers, and he will never say a word against you till you want to repay him.' Anyhow it has come to pass that 'melodious Rogers,' whom Byron ranked above Wordsworth and Coleridge, as we too might rank him if only his works had perished, is better remembered to-day by a few of those ill-natured things (e.g. by his witty couplet upon Ward; see EPIGRAM) than by his poetry, which, chaste though it be, and elegant and cultured, with 'no such thing as a vulgar line in it,' is dead and mummified. It is no more a pleasure of memory, but unread, not even forgotten. One is reconciled somewhat to such oblivion by remembering how, when in his old age Fanny Kemble used to go and sit with Rogers, she never asked what she should read to him without his putting into her hands his own poems, which always lay by him on his table. For this was the Rogers who had announced his intention of being 'read to, when old and bedridden, by young people—Scott's novels perhaps.' There is not much more to tell of him—the bank-robbery (£47,000, 1844); the proffer by Prince Albert of the laureateship (1850); the street accident—knocking down by a carriage (1850)—which crippled him for the rest of his life; and the peaceful ending of that life (*æt.* ninety-two) on 18th December 1855. He is buried at Hornsey.

See Alexander Dyce's *Recollections of the Table-talk of Samuel Rogers* (1856); *Recollections by Rogers*, edited by his nephew William Sharpe (1859); Hayward's article in the *Edinburgh Review* for July 1856 (reprinted in his *Essays*, 1879); and, especially, P. W. Clayden's *Early Life of Rogers* (1887), and *Rogers and his Contemporaries* (2 vols. 1889).

Roget, PETER MARK, was born in London in 1779, the only son of a Genevan who had settled as minister of a French church in London and married the sister of Sir Samuel Romilly. He was educated at Edinburgh, became physician to the Manchester Infirmary in 1804, and in 1808 settled in London, where he became physician to the Northern Dispensary; F.R.S. (1815), and afterwards for nearly twenty years its secretary; Fullerian professor of Physiology at the Royal Institution; and an original member of senate of the University of London, surviving till September 17, 1869. He wrote one of the 'Bridgewater Treatises,' *On Animal and Vegetable Physiology considered with Reference to Natural Theology* (1834), and the more famous *Thesaurus of English Words and Phrases* (1852), passed through 28 editions in his lifetime.

Rogue-money, an assessment formerly levied on every county in Scotland 'for defraying the charges of apprehending criminals, or subsisting them when apprehended, and of carrying on prosecutions against them.' This tax was first imposed by statute, 11 Geo. I. chap. 26, on the narrative that criminals were in the habit of escaping punishment for lack of the funds necessary to bring them to justice. The freeholders in each shire were directed to fix the assessment at any of the head courts yearly, and to appoint collectors. By 31 and 32 Vict. chap. 82 rogue-money in the shires was abolished, and in lieu thereof power was conferred on the Commissioners of Supply to levy by rate a 'County General Assessment.' By the Local Government (Scotland) Act, 52 and 53 Vict. chap. 50, sect. 11, this power of the Commissioners of Supply is now vested in the locally elected county councils. It is to be observed, however, that the repealed portions of 31 and 32 Vict. chap. 82 do not include sect. 10, which reserves the existing right of any burgh to levy rogue-money.

Rohan, an ancient Breton family of princely rank, descended in the male line from the dukes of Brittany, the name taken from the village of Rohan in the department of Morbihan. Its motto was characteristic of its pride: 'Roy ne puys, Duc ne daygne, Rohan suys.' The family still flourishes in the line of Rohan-Guémenée-Rochefort, naturalised with princely rank in Austria. The line of Rohan-Soubise became extinct in 1787, that of Rohan-Gié in 1638. The founder of the family was Alain I., fourth son of the Vicomte Eudon de Porhoët, who became Vicomte de Rohan in 1128. Under Charles IX. in 1570 the domain of Guémenée was formed into a principality for Louis Rohan VI., whose son Louis de Rohan-Guémenée was made in 1588 by Henry III. Duc de Montbazon. Both the latter and his son Hercule (died 1654) bore arms against the League. The famous beauty, wit, and political intriguer, the Duchesse de Chevreuse (died 1679), was a daughter of Hercule. Louis, Prince de Rohan-Guémenée (born 1635), lost the favour of Louis XIV. by his dissolute life, and died on the scaffold in 1674 for treasonable dealings with the Dutch.

LOUIS RENÉ EDOUARD, PRINCE DE ROHAN-GUÉMENÉE, born 25th September 1735, embraced the clerical life in spite of dissolute morals and an extravagant love of luxury, and at an early age became coadjutor to his uncle the Bishop of Strasburg. In 1772 he was sent as a special minister to Vienna. His habits were displeasing to Maria Theresa, and he ruined himself at the French court by slanderous gossip about Marie Antoinette. He was recalled in 1774, and, although with grudging, made grand-almoner in 1777. Next year came a cardinal's hat, through the influence of Stanislaus Poniatowski, king of Poland; and a year later the succession to the bishopric of Strasburg, held by three members of his family before him. His eagerness to recover his footing at court made him an easy victim to the schemes of Cagliostro and the adventuress Lamotte, and their clumsy forgeries and personations were enough to make him purchase the famous Diamond Necklace for the queen. As soon as the plot was discovered the cardinal was sent to the Bastille, but was acquitted by the Parlement of Paris, 31st May 1786. He found himself for the moment a hero of the mob, was elected to the States-general in 1789, but refused to take the new oath to the constitution in January 1791, and retired to Ettenheim in the German part of his diocese, where he died, 17th February 1803.

See DIAMOND NECKLACE, and books enumerated thereat; also the far from trustworthy *Mémoires inédites du Comte de Lamotte-Valois* (edited by Louis Lacour, 1858), and G. C. D'est Ange, *Marie Antoinette et le*

Procès du Collier (1889); the *Mémoires* of Rohan's secretary, the Abbé Georgel, as well as the books by Beugnot and Madame Campan.

With Victor Louis Mériadec, Prince de Rohan-Guémenée, Duc de Montbazon and Bouillon, who died in 1846, ended the direct main line. He was succeeded by his two nephews, scions of a younger branch of the line Guémenée, that of Rohan-Rochefort, who had been adopted in 1833 by his brother Jules Armand Louis (died 1836).

The line Rohan-Gié, which sprang from that of Guémenée, was founded by Pierre de Rohan de Gié (1453–1513), marshal and tutor of Francis I. His son fell at Pavia in 1525; his grandson, René I., at Metz in 1552. The latter was married to Isabella d'Albret, great-aunt of King Henri IV., whence the Calvinism of the family. René II. (1550–86) married in 1575 the celebrated poetess, Catherine de Parthenay, heiress of the house of Soubise.—Their son Henri, Duc de Rohan-Gié, Prince of Leon, was born 21st August 1579 at the castle of Blain in Brittany, and at sixteen came to the court of Henry IV., with whom he was ever an especial favourite. He was made in 1603 Duc de Rohan and a peer of France, and in 1605 he married the daughter of Sully. After the king's murder—a fatal blow to his hopes—he became one of the chief leaders of the Huguenot party in France, and, when all endeavours to bring about a peaceable settlement had come to nothing, took up the sword, fortified the places in Guienne, held Montauban against the king, and at last forced him in the peace of 1622 into a confirmation of the Edict of Nantes. Thereafter he took his share in all the tortuous intrigues of the time, fighting now for his king, now against him, ever holding up the religious cause, alike in times of open warfare and hollow peace. After the surrender of La Rochelle (1628) a price was set on his head, and he made his way to Venice, but soon after was called on by Richelieu to serve his king in the Valtelline, out of which he speedily cleared both the Imperialists and the Spaniards. He next carried his sword to Bernhard of Saxe-Weimar, but received a wound at Rheinfelden on the 28th February 1638, of which he died at Königsfeld on the 13th April. But his name survives best in his admirable *Mémoires*, three books of which (1644) embrace the civil wars, the fourth (not published till 1758) the Valtelline campaign. They may be found in Michaud and Ponjoulat's collection.

See the works by Fauvelet du Toc (Paris, 1667), Schybergson (*ib.* 1880), H. De La Garde (*ib.* 1884); Bühring, *Venedig, Gustav Adolf, und Rohan* (Halle, 1885); Laugel, *Henri de Rohan, son rôle politique et militaire sous Louis XIII.* (Paris, 1889); and the *Edinburgh Review* for April 1890.

His daughter, Marguerite de Rohan, brought the great possessions of the house in 1645 to her husband, Henri de Chabot, Marquis de Saint-Aulaye, who thereupon assumed the name of Rohan. From this line have sprung Charles Louis Josselin de Rohan-Chabot, Duc de Rohan, Prince de Léon (born 1819), and his son, Alain, Prince de Léon (born 1844).

See SOUBISE; also De la Chenaye-Desbois, *Genealogie des Hauses Rohan* (Prague, 1872).

Rohilkhand, a division of the North-western Provinces of India, lying west of Oudh, has an area of 10,908 sq. m. and a pop. of 5,343,674.

Rohillas were Afghan Pathans who rose to power in Rohilkhand, India, about the middle of the 18th century. The Mahrattas on one side and Shuja ud-Daula of Oudh on the other pressed them hard; at last Shuja, with the help of British soldiers lent to him by Warren Hastings, succeeded (1773–74) in subduing them. See Sir John Strachey's *Hastings and the Rohilla War* (Oxford, 1892).

Rohlfs, GERHARD, German traveller in Africa, was born at Vegesack near Bremen on 14th April 1832, studied medicine at Heidelberg, Würzburg, and Göttingen, and joined (1855) the Foreign Legion serving in Algeria. Having learned Arabic and made himself thoroughly familiar with Mohammedan customs, he set off (1861) for Morocco, travelled through that country under the protection of the Grand Sherif, and was exploring the Wady Draa in the Sahara (1862) when he was attacked by his own guides, plundered, and left for dead in the desert. Two marabouts found him and carried him back to Algeria. In 1864 he again visited the Sahara, getting to Tuat and Ghadames; in 1865 he was in Fezzan and Tibesti; in 1866 in Bornu, whence he made for the Benue, and so reached the Niger. He accompanied the British expedition to Abyssinia in 1868; and was then sent to carry presents from the king of Prussia to the sultan of Bornu. In 1873–74 he was commissioned by the khedive of Egypt to lead an expedition to the oasis of Sivah (Jupiter Ammon) in the Libyan Desert. The German government in 1878 sent him to carry presents from the emperor to the sultan of Wadai; but the expedition was attacked and driven back by Arabs in the oasis of Kufra. The last mission of Rohlfs was from the German emperor to Abyssinia in 1885. He died 2d June 1896. Most of his journeys he described in separate books, such as, e.g., *Reise durch Marokko* (4th ed. 1884); *Reise durch Nord-Africa in 1865–67* (1868 and 1873, in *Petermanns Mitteilungen*); *Land und Volk in Afrika* (1870); *Quer durch Afrika* (1874); and several others.

Rohtak, a town of British India, in the Punjab, 42 miles NW. of Delhi. Turbans are manufactured. Pop. 15,699.—The *district* has an area of 1797 sq. m. and a pop. (1891) of 590,475.

Rokitansky, KARL, BARON VON, founder of the school of pathological anatomy at Vienna, was born at Königgrätz in Bohemia on 19th February 1804, studied medicine at Prague and Vienna, in 1828 was appointed assistant to the professor of Pathological Anatomy in the university of the latter city, and in 1834 succeeded him. He likewise held the offices of prosector at the city infirmary, legal anatomist to the city, and medical adviser to the ministry of education and public worship. In 1869 he was made president of the Austrian Academy of Sciences. He retired from work in 1875, and died on 23d July 1878. Although Rokitansky agreed with the old humoral pathologists in so far that he regarded the changes of the blood as the chief immediate causes of disease, he laid the principal stress of medical study upon morbid anatomy, post-mortem dissection, and observation. He stands pre-eminent amongst German medical teachers as the one who established pathological anatomy as the basis of all original scientific inquiry in the domain of medicine. His teachings were published in the great work *Handbuch der pathologischen Anatomie* (5 vols. 1842–46; 3d ed. 1855–61; Eng. trans. of Sydenham Society, 4 vols. 1849–52), and in *Memorials* of the Vienna Academy of Sciences. See an anonymous Biography (Vienna, 1874).

Rokitno, a vast swampy region, now being gradually drained, between the rivers Pripet, Dnieper, and Beresina in West Russia. This region is regarded by Pösche as the original home of the Aryans, whence proceeded the lake-dwellers of Switzerland and the Po valley. See ARYAN RACE.

Roland (Ital. *Orlando*, Span. *Roldan*), the name of the most prominent hero in the Charlemagne legend. Unlike most legendary heroes,

Roland is a figure in history as well as in poetry and fable, though it cannot be said that the place he occupies as a historical personage is an imposing one. All that we know of him is contained in one line of Eginhard's *Vita Karoli*, chap. ix., and that simply records his name, Hruodlandus, his rank of prefect or warden of the march of Brittany, and his death at the hands of the Gascons in a valley of the Pyrenees. Such is the acorn from which a whole forest of romance has sprung up. According to the *Annals* (commonly attributed to Eginhard, but by some to Angilbert, who died fifteen years before they end), Charlemagne was invited in 777 to take possession of Saragossa and other cities in Spain by Ibn al Arabi, leader of the revolt against the Khalif Abd-er-Rahman, and in 778 crossed the Pyrenees into the territory of the Gascons, attacked and took Pamplona, the stronghold of the Navarrese, and advanced to Saragossa, and having received the submission of Ibn al Arabi and his friends, and taken hostages of them, returned the way he came. According to other accounts the Saracens played him false, and a rising of the Saxons compelled him to hasten home. Al Makkari merely says that after warring for some time with Abd-er-Rahman he sent him an embassy proposing an alliance and friendship, and that peace was concluded between them. At any rate it is certain that Charles made but a short stay in Spain, that on his way back he levelled the walls of Pamplona to the ground, and that about 25 miles north-east of it the rearguard of his army was annihilated by the Gascons. 'Roscida Vallis,' the common etymology of Roncesvalles, the scene of the disaster, is, of course, like all such etymologies, nonsense. In its oldest known form the name is Rencesvals, and there can be no doubt that it is Basque. Whatever may be the true reading of the first syllable, the last two are clearly a corruption of *zabal* or *zaval*, a word which enters into the composition of perhaps a hundred place-names in Navarre and the Basque provinces, always indicating a flat, level space, which exactly describes the battlefield. It is a small oval plain, evidently an old lake-bed, shut in all round, except on the south where the waters escaped, by steep mountain-ridges clothed from base to summit with thick beech woods. To the north there is a slight depression where, by the Col of Ibañeta, a path crosses the crest of the Pyrenees and descends the Val Carlos to St Jean-Pied-de-Port. The features of the spot, and the facts of the catastrophe, no doubt, also, are faithfully given in a few words by Eginhard, who in his youth must have often heard them spoken of by Charlemagne's old soldiers. As the army, by reason of the narrowness of the place, was marching in extended order, the Gascons, who, profiting by the denseness of the woods that abound there, had posted themselves in ambush on the heights, rushing upon those guarding the rear, hurled them into the valley beneath, and there slew them to a man; and having seized the baggage, dispersed under cover of the night in all directions, so that there was no finding them to take vengeance upon them. Roncesvalles is in fact a natural trap, and it says little for Charles as a general that he should have ventured into it without first securing the heights and scouring the woods; for when Roland, in the *Chanson*, thinks of it, it is too late. He was in a hostile country, made so by his own acts. It may be—to put him in the most favourable light—that he was compelled by military necessity to invade Navarre, that resistance forced him to take Pamplona, that levelling its walls, though it looks awkwardly like spite, was a precaution in view of a future campaign, and that, in short, he 'simply used military license upon the country.' But this, as Major Dalgetty observes, 'excites no benevolence in those who sustain injury,' and the Basques of Navarre had good reason to resent their treatment at his hands. They were not semi-savage mountaineers, as most French writers try to make them out, but a gallant little Christian state holding their own stoutly, after the fashion of Pelayo, against the common foe; and yet this pillar of the church, this pious champion of Christianity, hot from the conversion of the Saxons, comes down upon them, for his own ends treats them as if they were Saracens, or worse, takes away from them their armour wherein they trusted, their walls, next to their mountains their best reliance, and leaves them naked to their enemies. Eginhard may talk of the perfidy of the Gascons, and poets sentimentalise over the *dolorosa rotta*, but history and justice will call it a merited retribution for overbearing militarism, and the proper punishment of insolent contempt for a weak adversary.

Naturally, the tragic character of the disaster, and the reverse to the mighty king of the Franks at the close of what was looked upon as a holy war, made a deep and wide-spread impression. Upon himself the effect, the *Annals* say, was that it clouded the success of his expedition, and there can be no doubt that already in his lifetime it was a theme with the popular minstrels far and wide. In the middle of the 9th century the biographer of Louis held it needless to mention the names of those who fell, *quia vulgata sunt*. In course of time the story underwent modifications in the hands of the poets. Everything in it was magnified. The expedition became a campaign lasting twice as many years as it had occupied months; the disaster was made a defeat of vast proportions, which, as a matter of course, was accounted for by treachery, the traitor Ganelon being invented for that purpose; the Basques were turned into Saracens; and for further dramatic effect Charlemagne, who was but thirty-six, was represented as a venerable old man with a snow-white beard, and Roland as his nephew. And here it may be asked, how came Roland to be set up as hero? Eginhard mentions two others as having fallen, Anselm and Eggihard, both of them persons of at least equal rank, and more immediately connected with the sovereign; but nothing more is heard of either. The only explanation is that, if they were left unwept, unhonoured, and unsung, it was because the jongleurs could not conveniently sing their names, while Rodland, Rotland, Rollanz, Roland lent itself to song as if made on purpose. 'An old song' is held to mark the zero of importance, but it is one of the most potent of agencies. It lurks among the roots of history, dispensing immortality at will, and conferring renown irrespective of deeds or merits. Roland, for aught we know, was only an ordinary Breton country-gentleman, but old songs have made him the equal of Achilles, Hector, Alexander the Great, and Arthur of Britain. Of these old songs we know little or nothing beyond the fact of their existence. If the *barbara carmina* taken down by Charlemagne's orders were of the same sort, they were probably the only ones of the kind ever committed to writing. Nor do we know much more of their relation to the earliest written lays. M. Léon Gautier, who has made the subject the study of his life, at first held that the *chansons de geste* were little more than the primitive songs strung together, but he now thinks that they were merely inspired by them, and borrowed only their legendary and traditional elements. The truth probably lies between the two views. It is more likely that there is no hard and fast line to be drawn between the songs and the *chansons de geste*, and that the latter were of very gradual growth. The jongleurs in singing the songs, cantilenæ, or ballads, as we should call them, relating to an event like the Roncesvalles disaster,

would naturally from time to time introduce new ones for the sake of novelty or as connecting links, and thus a recognised sequence would be established, which, as minstrelsy became more and more of an art, the jongleurs more like trouvères, and their hearers more cultured and critical, would in course of time grow into a continuous lay. By some such process as this, in all probability, the *Chanson de Roland*, unquestionably the oldest and best of the *chansons de geste*, was produced.

The oldest form in which we have it is that of the MS. in the Bodleian Library, Oxford, written presumably towards the end of the 12th century; but this is evidently by no means its oldest form as a consecutive poem. M. Gautier, who loves precision, places its composition between the Norman Conquest and the first Crusade, but it is impossible to fix precisely the date at which it ceased to be a mere congeries of songs and became a *chanson de geste;* at any rate the two references to England as one of Charlemagne's many conquests cannot be relied upon. Nor do the allusions to Mont Saint-Michel justify the assertion that it is *certainly* the work of a Norman. It is of course in the language of the northern half of France, the language of the trouvères, but there is no good reason for assigning it to any one province. An interesting reference to the country of the poem is spoiled by M. Gautier. The death of Roland, we are told, was presaged in France by storms and earthquakes 'from Saint-Michel to Seinz, from Besançon to Wissant.' It is not certain here what place is meant by Seinz. M. Francisque-Michel suggests Sens; a 13th-century MS. reads Rains (Reims); M. Gautier boldly proposes the 'saints of Cologne'—i.e. the relics preserved there. Far more probably, as a glance at the map will show, the place intended is Saintes on the Charente, the old capital of the Santones and of Saintonge, a town that makes a considerable figure in the middle ages and in the Charlemagne legend. With the other three places mentioned it forms a quadrangle which exactly represents the region within which the *langue d'oïl* was dominant. South of the line from Saintes to Besançon was the country of the *langue d'oc*, the Provençal; west of the line from Mont Saint-Michel to Saintes was the Breton; east of the line from Besançon to Wissant, near Calais, the language was Teutonic. The old minstrel was not thinking of a Rhine frontier, as M. Gautier imagines, but of the habitat of his hearers, the country where his words would be understood. The best, and most likely the oldest, part of the poem is that which deals with the combat at Roncesvalles, Roland's refusal, until too late, to sound his horn, the deeds and deaths of the peers one by one, and of Roland last of all. The opening portion, the despatch of Ganelon at Roland's suggestion as envoy to the Saracens, his anger and betrayal of Roland in revenge, and the concluding part, the vengeance of Charlemagne, and the trial and death of Ganelon, probably came later. There can be little doubt that the episode of the Emir Baligant was a comparatively late addition.

Besides the Oxford MS. there are half-a-dozen others ranging from the 13th to the 16th century. The differences between the earlier and later are significant. In the Oxford MS., which is one of the little pocket copies carried by the jongleurs, the assonant rhyme (that which disregards the consonants and depends on the accented vowel) is maintained throughout, the same assonance being kept up to the end of each break or paragraph. In the later MSS. the assonant is turned into the full consonant rhyme, and the poem expanded to twice or thrice its former length. The first shape is the poem as *sung;* the second as adapted for readers when the minstrel was no longer the sole vehicle for poetry and reading was becoming a common accomplishment. A very close German version, the *Ruolandes Liet*, shows that early in the 12th century the chanson had passed out of its native country and language; and it is almost as closely followed in the Icelandic *Karlamagnus Saga* of the 13th. The *Chanson de Roland* is the foundation of the Charlemagne legend. Charles's wars and quarrels with his vassals would no doubt of themselves have furnished themes for the jongleurs, but the legend, culminating in the Morgante of Pulci and the Orlandos of Boiardo and Ariosto, is the outcome of the story of Roland and Roncesvalles.

The following are the printed editions of the *Chanson de Roland:* From the Oxford MS., by Francisque Michel (Paris, 1837); Text, with translation, by F. Genin (Paris, 1850); the Oxford text, ed. by Professor Müller (Gött. 1851; reprinted with additions, 1863, 1878); 2d ed. of F. Michel's, with text of 13th-century MS. in the Bib. Nat. added (Paris, 1867): *Rencesval*, Oxford text, E. Boehmer (Halle, 1872); MS. of Lib. of St Mark, Venice, fac-simile by E. Kolbing (Heilbronn, 1877); Oxford MS., ed. by E. Stengel, with a photograph fac-simile (Heilbronn, 1878); Text, with translation in assonant rhyme, Petit de Julleville (Paris, 1878); Text, with translation, commentary, notes, &c., by Léon Gautier (16th ed. 1887). There are other translations by Jonain, Lehugeur, St Albin, and Jubert. By far the best is by the Baron d'Avril (Paris, 1865, 1866, 1877). The *Ruolandes Liet* was printed in 1727, and again by W. Grimm in 1838, and by Karl Bartsch (1874); and there is a translation by W. Hertz (1861). Mrs Marsh in 1854 translated Vitet's epitome of the poem, and Mr John O'Hagan has given an accurate, scholarly, and spirited version from the original (2d ed. 1883). There is also an English translation by L. Rabillon (New York, 1885).

Roland de la Platière, Jean Marie, and his greater wife, Madame Roland (*née* Marie-Jeanne, or Manon, Phlipon), are among the most memorable martyrs of the French Revolution. Roland was born of a decayed legal family at Villefranche near Lyons in 1734. He made his way unaided, and had risen to be inspector of manufactures at Amiens, when about the close of 1775 he made the acquaintance of his gifted wife. She was twenty years his junior, having been born at Paris, 18th March 1754, daughter of an engraver, who had ruined himself by unlucky speculations. From the first an eager and imaginative child, she read everything, even heraldry, and Plutarch made the young idealist a republican for life. At eleven she went for a year into a convent to prepare for her first communion, next passed a year with her grandmother, and then returned to her father's house, where she read Buffon, Bossuet, and Helvétius, and at length found her gospel in the writings of Rousseau. Her admirable mother died in 1775, and the girl, solitary and poor, untouched in heart by her many admirers, and soured to her father by his misconduct, at length in February 1780 married the estimable Roland. He was over forty, thin, yellowish, careless in dress, abrupt and austere in manners, solid and well-informed indeed, but dry, unsympathetic, and addicted to talking about himself. But she buried the latent passions of her heart, and for ten years made herself an admirable wife and mother, with perfect domestic simplicity. They lived at Amiens, where her only child, a daughter, was born (October 1781); and next at Lyons, and travelled in England and Switzerland. The Agricultural Society of Lyons charged Roland to draw up its *cahier* for the States-general, and in February 1791 he went to Paris to watch the interests of its municipality, returned to Lyons in September, but came back to Paris before the close of the year. It was now that Madame Roland's masculine intellect and woman's heart made her the queen of a coterie of young and eloquent enthusiasts that included all the famous and ill-fated leaders of the Gironde, Brissot, Buzot,

Pétion, and at first even Robespierre and Danton. Her noble beauty, dark expressive eyes, sweet voice, and eloquent words added a charm to patriotism that was irresistible. In March 1792 Roland became minister of the Interior, and his stiff manners, round hat, and unbuckled shoes struck dismay into the court. Three months later he was dismissed for his disloyal remonstrance to the king, who had refused to sanction the decree for the banishment of the priests. It was Madame Roland's vigorous pen that wrote this letter, as indeed she wrote most of the papers that her husband signed. He was recalled after the king's removal to the Temple, made himself hateful to the Jacobins by his protests against the September massacres, and took his part in the last ineffectual struggle of the Girondists to form a moderate party. It was in the last days of the Gironde that the reciprocal affection between Madame Roland and Buzot crossed the indefinite bounds that separate friendship from love. It was the one touch of softness that her nature needed, says Sainte-Beuve, to make it wholly feminine and French. But her Spartan soul sacrificed its passion to duty, and strong in the purity of her heart she made a confidant of her husband, partly perhaps because she sought in this a strange safeguard against herself, but doubtless still more because the ideal love to that exalted virginal heart was a love nourished upon sacrifices, that encircles its object with an aureole of respect, and dreads to find in possession the end of its enchantment. The struggle brought on six days of physical exhaustion, and on the seventh the sound of the tocsin announced the proscription of the Twenty-two (31st May). Roland had been arrested, but escaped and fled to Rouen; Buzot and some of the others fled to Caen to organise insurrection, but in vain; next day she herself was seized and carried to the Abbaye. Set at liberty two days later, she was arrested anew and taken to Sainte-Pélagie. She had five more months of prison before death closed her tragedy of life, and during this time she wrote her unfinished *Mémoires*, furtively, with a swiftly flowing pen, on sheets of coarse gray paper given her by a kindly turnkey, often blotted by the falling tears. The stern joy with which she had hailed the dawn of revolution, her hatred of the throne, the high hope and heroic disinterestedness of her dreams—all her sincere illusions were now dissipated, and at length she saw into the heart of that declamatory tragedy called the Revolution. Her character, made perfect through suffering, took on a new refinement; she carried with her into death something of the sanctity of the martyr, and still, in Carlyle's phrase, like a white Grecian statue, serenely complete, she shines in that black wreck of things. She bore herself in prison with a gracious and queenly dignity, buried in her Thomson, Shaftesbury, Plutarch, and Tacitus. The approach of death unsealed her lips, and (22d June to 7th July) in four letters to Buzot, strangely discovered in 1863, she spoke out a love that could never now come into conflict with duty. On the 1st November, the morning of the execution of the Twenty-two, she was transferred to the Conciergerie, and there lay for eight days. She went to the Tribunal dressed all in white, her long black hair hanging down to the girdle, and in the dusk of the 8th November 1793 she was carried to the guillotine along with a trembling printer of assignats, whom she asked Sanson to take first to save him the horror of seeing her head fall.—'You cannot,' said she, 'refuse the last request of a woman.' It is usually told how, on the point of entering the awful shadows of eternity, she asked for pen and paper to write down the strange thoughts that were rising within her, but Sainte-Beuve thinks it impossible, puerile, untrue to the nature of the heroine, as well as unauthenticated by good contemporary evidence. As she looked up at the statue of Liberty, she exclaimed, 'O Liberté, comme on t'a jouée!' or as it is still more commonly given, 'O Liberté, que de crimes on commet en ton nom!' She had often said her husband would not long survive her; a week later he ran himself through with his sword-stick near Rouen, November 15, 1793.

Madame Roland's *Mémoires* reflects little of the horrors amid which it was written, but is a serene and delightful revelation of her youth in a series of charming glimpses. But in writing she is best and most natural in her letters, as in the series to Bosc, those to Bancal des Issarts, the four to Buzot, and the exquisitely simple letters to her two school friends, Henriette and Sophie Cannet. The best editions of the *Mémoires*, for the first time printed in their entirety, are those of Dauban (1864) and Faugère (1864). Her *Letters* were collected by Dauban (2 vols. 1867). See the studies by Dauban (1864), Mathilde Blind (1886), and Ida M. Tarbell (1896); Lamy, *Deux Femmes Célèbres* (1884); and Austin Dobson, *Four Frenchwomen* (1890); Sainte-Beuve, in *Nouveaux Lundis*, and in *Portraits de Femmes*; Scherer, in his *Études*.

Rolf. See NORTHMEN, NORMANDY.

Rolle, RICHARD. See HAMPOLE.

Roller (*Coraciidæ*), a family of Picarian birds characteristic of the Ethiopian and Oriental regions, although the common Roller is extensively distributed in the Palæarctic region and a few species enter the Australian region. None are found in the New World. Madagascar possesses three species peculiar to itself, and so different from one another that they are regarded as types of different genera, and so different from other rollers that they are grouped into a separate sub-family, Brachypteraciane: they are named ground-rollers, and are nocturnal in habit. An Indian species, *Eurystomus orientalis*, is also nocturnal. The Common Roller (*Coracias garrula*) is an autumn or more rarely a spring visitor to the British Isles; and about one hundred have been recorded since the first one was noticed by Sir Thomas Browne in 1644. Some have visited the Orkneys

The Common Roller (*Coracias garrula*).

and Shetlands, one has been found as far west as St Kilda, and about half a dozen have been recorded from Ireland. It is a straggler to northern Europe: in central Europe it is common; in countries bordering on the Mediterranean it is very abundant. It ranges through Asia to Omsk in Siberia and to North-west India. In winter it extends its migrations to Natal and Cape Colony. In size it is about a foot long. The general colour is light bluish green: the mantle is chestnut-brown: the wings and rump are adorned with beautiful azure blue. The female resembles the male in plumage. Nesting takes place in the

woody haunts in May. The nest, which is made in a hollow tree or wall, is built of a few chips, or of roots, grass, feathers, and hair, according to circumstances. The eggs are five or six in number and are of a glossy white colour. The food consists of beetles and other insects captured on the ground. The name 'Roller' is given to the bird on account of its varied and unsteady flight and the habit the male has, during the breeding season, of indulging in extraordinary tumbling antics, and turning somersaults in the air.

Rolleston, George, was born at Maltby in Yorkshire, July 30, 1829. He had his schooling at Gainsborough and Sheffield, next entered Pembroke College, Oxford, took a classical first-class in 1850, and was elected Fellow of his college the next year. He studied at St Bartholomew's Hospital, and was appointed in 1855 a physician to the British Civil Hospital at Smyrna. Returning to England in 1857, he was made physician to the Radcliffe Infirmary at Oxford, and somewhat later Lee's reader in Anatomy. In 1860 he was appointed Linacre professor of Anatomy and Physiology, became F.R.S. in 1862, Fellow of Merton College in 1872, and died June 9, 1881. His *Forms of Animal Life* (1870) gave him a high reputation, confirmed by his valuable dissertation on craniology in Greenwell's *British Barrows* (1877). See Life prefixed to his *Scientific Papers and Addresses* (ed. Turner and Tylor, 2 vols. 1884).

Rolliad, the name, derived from Lord Rolle (1750–1842), a staunch supporter of Pitt, for a series of Whig satires by George Ellis and others, directed mainly against Pitt and Dundas.

Rollin, Charles, born at Paris, January 30, 1661, studied at the Collége du Plessis, and became professor there, next at Paris, and was chosen rector of the university of Paris in 1694. In 1699 he was appointed coadjutor to the principal of the College of Beauvais, but was ejected from this situation twelve years later owing to his Jansenistic sympathies. He was re-elected rector of the university in 1720, and died September 14, 1741. His *Traité des Études* (4 vols. 1726–31) has been pronounced by Villemain 'a monument of good sense and taste;' his *Histoire Ancienne* (13 vols. 1730–38), long popular and much translated, is feeble in its philosophy, jejune in its criticism, and often inaccurate in its facts. Yet it has opened the study of ancient history to many men since the young prince Frederick the Great. His *Histoire Romaine* (16 vols. 1738–48) was a much inferior work, long since deservedly forgotten.

Rollin, Ledru. See Ledru-Rollin.

Rollo. See Northmen, Normandy.

Rolls, Master of the, was formerly the chief of the twelve Masters in Chancery, entrusted with the care of grants passed under the great seal, and of all the records of the Chancery; he also sat on the equity side of the court as an independent though subordinate judge; doubts having been raised as to his jurisdiction, his powers were confirmed by act of parliament in 1730. The official residence of the Master of the Rolls in Chancery Lane, with the chapel, &c. thereto attached, form the Liberty of the Rolls. The Master of the Rolls was formerly permitted to sit in the House of Commons, and this usage was defended in a well-known speech by Macaulay. By the Judicature Act of 1873 the Master of the Rolls was excluded from the House of Commons; he has since been transferred, by an act passed in 1881, to the Court of Appeal, but he continues to perform administrative duties as head of the Record Office. For the Rolls Series, see Records.

Romagna, formerly the name of a region of Italy, forming the northern portion of the states of the Church (q.v.), and comprising the *delegations* of Bologna, Ravenna, Ferrara, and Forlì. These delegations became in 1861 distinct provinces of the kingdom of Italy.

Romaic, a term for the popular Greek dialect developed before the fall of the Byzantine empire, essentially similar to the modern Greek tongue as now spoken. The first who wrote in this popular tongue is believed to have been a monk Prodromus in the 12th century. Those who clung to the old Attic which still maintained an artificial existence called themselves *Hellenes;* the party of the popular speech were called *Romaioi,* from *Nea Rōmē* ('new Rome'), the new name for the capital of the eastern empire. See Greece, Vol. V. p. 392.

Romaine, William, evangelical divine, was born at Hartlepool, Durham, September 25, 1714, and was educated at Hertford College and Christ Church, Oxford. He held curacies at Lew Trenchard, Devon; Banstead and Horton, Middlesex; was lecturer of St George's, Botolph Lane, and St Botolph's, Billingsgate, and of St Dunstan's-in-the-West from 1749 till his death. He was also assistant morning preacher at St George's, Hanover Square, 1750–55; curate and morning preacher at St Olave's, Southwark, 1756–59; and morning preacher at St Bartholomew the Great, Smithfield, 1759. In 1764 he was chosen rector of St Andrew Wardrobe and St Ann's, Blackfriars, and though the election was disputed it was confirmed by the Court of Chancery in 1766, and he held the living till his death, July 26, 1795. Romaine was a bulwark of Evangelicalism in his day, though himself infected with the taint of Hutchinsonianism. He assailed, not without credit, Warburton's *Divine Legation of Moses;* published commentaries, many sermons, and three books of edification that enjoyed for three generations a remarkable popularity: *The Life of Faith* (1763), *The Walk of Faith* (1771), and *The Triumph of Faith* (1794). There is a complete edition of his works, with a Life by the Hon. and Rev. W. B. Cadogan (8 vols. 1796).

Roman Architecture. Of the early architecture of Rome and the other Latin cities comparatively little is known; the remains of early Italian architecture consist of a few arches and sepulchral monuments. With the conquest of Carthage, Greece, and Egypt the Romans became acquainted with the arts of those countries, and by degrees endeavoured to use them for the embellishment of the imperial city. Besides, Rome under the empire was the capital of the world, and attracted artists from every country. The result was that the architecture of Rome became a mixed style. It was largely imported, and partook of the character of the importers. The great interest of Roman architecture is that it is a mixture and amalgamation of ancient styles, and the starting-point for modern styles. It is thus the connecting-link between ancient and modern art; the whole history of Roman architecture being that of a transition, slow but steady, from the external architecture of the Greek temple to the internal architecture of the basilica. Rome borrowed from Greece the oblong peristylar temple, with its horizontal construction and decoration, and the various 'orders.' See Column, Greek Architecture. From the Etruscans probably were derived the circular form of temple and the circular arch, which became leading features in the development of the future Roman style. The peripteral form of the Greek temple, however, was seldom followed by the Romans, who preferred to adhere to the early Italian form of columns attached to the walls of the cella.

The *Orders* imported from Greece were the Doric,

Ionic, and Corinthian. These were all used in Rome, but with some modifications; the Doric, for example, being never employed as in Greece, being without fluting, and having the capital and entablature altered, and a base added, so as to make the style more similar to the others, with

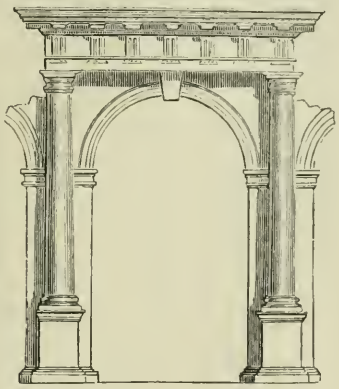


Fig. 1.—Doric Arcade.

which it was often associated. The Ionic had the volutes turned out angularwise, so as to present a similar face in each direction. The favourite 'order' of the Romans, however, was the Corinthian. It was invented in Greece, but more fully developed in Rome, where it suited the desire which existed for richness and luxuriance in architecture. Many fine examples of this style exist in Rome (as the Pantheon and the temple of Jupiter Stator) and in the provinces (as the Maison Carrée at Nîmes and the Great Temple at Baalbek), the capitals, wherever found, being designed in endless variety. The Composite order was an invention of the Romans, and is sometimes called *the Roman order*. It is a combination of the Ionic and Corinthian. All these orders were employed by the Romans, but in a manner peculiar to themselves; they combined with the Greek orders the arch. This feature, at first confined to substructures, was gradually introduced into the visible parts of the structure, and became finally an important

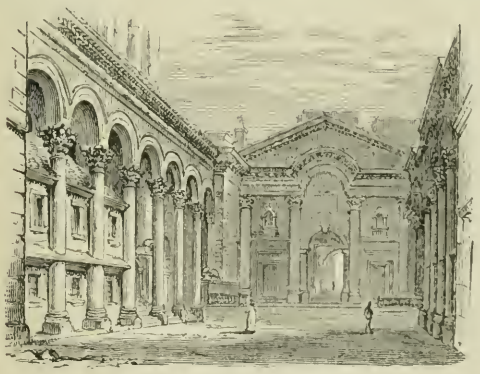

Fig. 2.—Courtyard at Spalato.

element in the elevations. The columns were placed (fig. 1) at wide intervals, and set on pedestals to give them and the entablature a proper proportion; whilst behind the columns square piers were introduced, and from them arches were thrown which supported the wall. This was the favourite style of the Romans, and may be seen in all their important works (amphitheatres, arches, baths, &c.). They piled one order above another, marking each story with the entablature. As the style proceeded vaulting and arching became more common, especially in internal construction, but the horizontal ornamentation was never entirely abandoned. Arches of the above construction were thrown from pillar to pillar behind the entablature, but gradually the pier was omitted, and the arch openly constructed from column to column, the architrave bent round it, and the cornice continued horizontally above, as at Diocletian's palace at Spalato.

The buildings executed by the Romans are very varied in their character, but the same style was used for temples, baths, amphitheatres, triumphal arches, tombs, &c. The earliest temples of which remains now exist are those of Jupiter Stator in the Forum, Jupiter Tonans, and Mars Ultor, all of the Augustan epoch, and each with only three columns left. These are supposed to have been nearly peripteral, and it is worthy of notice that the cells are all large, and one of them has an apse.

One of the most interesting temples of Rome is the Pantheon. The portico is of the age of Augustus, but the rotunda is probably considerably later. The dome of the interior is a splendid example of the progress of Roman architecture in developing

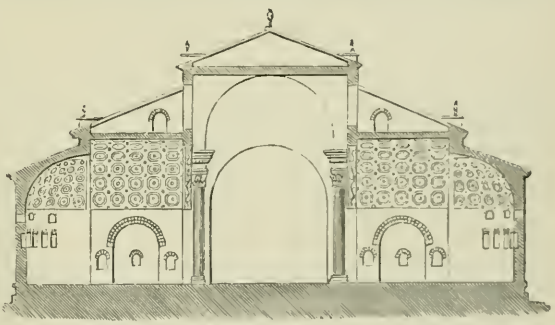

Fig. 3.—Transverse Section of Basilica of Maxentius.

the use of the arch, and transferring the decoration from the exterior to the interior. The former is in this case totally sacrificed to the latter; but the interior has not yet been surpassed for boldness of construction or simplicity and sublimity of effect (see PANTHEON). Other examples of circular temples, on a small scale, are found at Tivoli and in Rome, both dedicated to Vesta.

The greatest works of the Romans, however, were not their temples. The Basilicas (q.v.), Amphitheatres (q.v.), and Baths (q.v.) are far more numerous and more stupendous as works of art, and all show how well the Romans had succeeded in producing an internal architecture, which at a later period became so useful as a model for Christian buildings. The Basilica of Trajan is a type of the Christian wooden-roofed churches; while that of Maxentius (fig. 3), with its great intersecting vaults, and its vaulted aisles and buttresses, contains the germs of the greatest Christian cathedrals. The Roman amphitheatres have never been surpassed for size and grandeur, or for suitability to their purpose. And of the baths sufficient remains still exist, although much decayed, from the perishable nature of the brick and stucco employed in their construction, to prove that the scarcely credible descriptions of contemporaries were surpassed by the magnificence of the buildings themselves.

Among the other varied public works of the Romans are their Aqueducts (q.v.) and bridges, triumphal Arches (q.v.), pillars of victory, and tombs. Of the tombs of the Romans the earliest and best specimen is that of Cæcilia Metella (wife of Crassus) on the Appian Way (fig. 4). It consists (like most Roman tombs) of a round drum

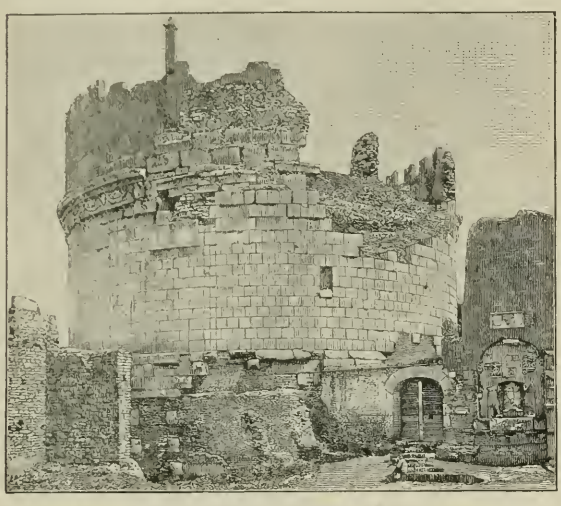

Fig. 4.—Tomb of Cæcilia Metella.

placed on a square basement, and was probably surmounted by a conical roof. The tomb of Augustus was similar, on a very large scale, and the sloping roof was broken into terraces planted with trees. That of Adrian (now the castle of St Angelo in Rome) is another enormous example. The tombs were generally ranged along the ways leading to the gates of cities.

The later tombs of Rome are well worthy of study, as they contain many specimens of the transition towards the Christian style. They are generally vaulted, frequently with domes, as, for instance, the tombs of St Helena and Sta Costanza. Fergusson also places the so-called 'Temple of Minerva Medica' (fig. 5) amongst the tombs. It

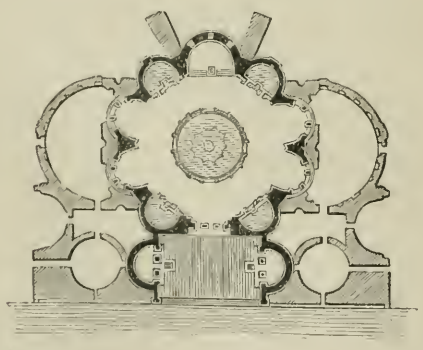

Fig. 5.—Plan of the Temple of Minerva Medica at Rome.

is a beautifully arranged building with ten sides, all containing deep niches (except the side with the door), surmounted by a clerestory, with ten well-proportioned windows. The vault is polygonal inside and outside; and the pendentives, ribs, buttresses, &c., which played so important a part in the Christian architecture both of the East and West, are distinctly used in its construction.

Of the domestic architecture of the Romans we have many wonderfully preserved specimens in Herculaneum and Pompeii, showing both the arrangements and decorations of the dwellings of all classes. Of the great palaces and villas, however, none remain except the palace of Diocletian, at Spalato, in Dalmatia—an important building, which shows many steps in the progress of the style.

See, besides the Handbooks of architecture, R. Adam, *Ruins of the Palace of Diocletian* (1764); Taylor and Cressy, *Architectural Antiquities of Rome* (1821; new ed. 1874); Freeman, *Historical and Architectural Sketches* (1876); T. G. Jackson, *Dalmatia, the Quarnero, and Istria* (3 vols. 1887).

Roman Catholic Church. Cardinal Bellarmine, in his treatise *De Eccl. milit.*, chap. 2, defines the 'church militant' as follows: 'An assembly of men united by the profession of the same Christian faith, and by the communion of the same sacraments, under the rule of legitimate pastors, and especially of the one vicar of Christ on earth, the Roman pontiff.' It is evident that this is really a definition of the Roman Catholic Church. The truth is that the Roman Catholic Church claims exclusive right to the title of Church of Christ on earth, and declares that 'outside of her fold there is no salvation.' This claim of the Church of Rome to be the exclusive means of salvation has been much misunderstood, and calls for some words of explanation. As we intend to remove a misconception, we explain first what the claim does not mean. It does not mean that none but Roman Catholics are in the way of salvation. This is sufficiently clear from the Encyclical letters ('Quanto conficiamur') of Pope Pius IX., dated August 10, 1863. 'It is well known,' writes His Holiness, 'that those who labour under an invincible ignorance concerning our most holy religion, and who at the same time sedulously observing the natural law and the precepts thereof, which are inscribed by God on the hearts of all, are ready to obey God, can, the virtue of divine light and grace working within them, attain to eternal life.' It is not then the teaching of the Roman Church that none but Roman Catholics are saved. The sense of the axiom 'outside the Church of Rome there is no salvation,' as understood by Roman Catholic theologians, is that, whereas Christ came on earth to establish a church which was to be the divinely appointed means for the salvation of all men, the Roman Catholic Church is that church. Further light may be cast on the sense of this axiom by considering the distinction made by Roman Catholic theologians between the body of the church and the soul of the church. By the body of the church they understand the church considered as a visible and external society. By the soul of the church they understand the supernatural life of the members of the church—that is to say, sanctifying grace. Whoever, then, is in the state of grace belongs to the soul of the church. Whoever is not in the state of grace, even though he belong to the visible and external organisation or body of the church, does not belong to the soul of the church. Now the axiom 'outside the church there is no salvation' has reference primarily to the soul of the church. Thus, then, according to Roman Catholic doctrine, the non-Catholic who dies in the state of grace is saved. The Catholic who dies out of the state of grace is lost.

Copyright 1891 in U.S. by J. B. Lippincott Company.

In the symbol commonly known as the Nicene Creed, faith is expressed in 'one, holy, Catholic, and Apostolic Church.' Christian antiquity then regarded unity, sanctity, catholicity, and aposto-

licity as properties of the true church. The Church of Rome claims to possess these properties, and to possess them manifestly, and in consequence claims to be clearly recognisable as the true church of Christ.—The Church of Rome claims to be *one*, with the completest and most perfect unity, with unity of doctrine, unity of liturgy, and unity of government. (1) With unity of doctrine. Roman Catholics all the world over have precisely the same faith: the learned, indeed, may have a larger acquaintance with the doctrines of faith than the illiterate; but there is nothing believed by the most learned theologian which is not believed, at least implicitly, by the most simple member of the faithful. Every Roman Catholic says, 'I believe whatever the holy Catholic Church proposes for my belief.' (2) With unity of liturgy. In every part of the world the Roman Catholic Church offers the same unbloody sacrifice of the mass, everywhere administers the same sacraments, everywhere observes the same great festival days, &c. (3) With unity of government. Roman Catholics, whether living under monarchical or republican governments, whether united to each other or divided from each other by their various national interests, are everywhere in subjection to their pastors and bishops, and above all to the Holy See. Indeed, it has perhaps never been denied that with respect to unity the Roman Catholic Church excels all other churches.—The Roman Catholic Church claims to possess visibly the second property of the true church—viz. *sanctity*. She claims to be holy (1) by reason of the holy doctrines which she teaches. Thus, she insists upon the great truth of moral responsibility. She declares that, though man's freedom of will was impaired by the Fall, it was not destroyed; that freedom of will remains, and that no adult can be saved without the due exercise of it. She proclaims that 'faith without works is dead.' She calls upon her children to confront their evil passions with the weapons of fasting and mortification in their hands; holds in high honour the 'life of counsels,' the life of voluntary poverty, chastity, and obedience; and declares that such was the life of the Lord and of the precursor of the Lord. (2) By reason of the means of holiness which she provides. Prominent amongst these a Roman Catholic would place the sacrament of penance. (3) By reason of the fruit of holiness which she produces. Professing that she has existed from the first, the Roman Catholic Church claims as her own all the saints of past times. She declares that her power of producing saints is strong to this day, and points to a St Francis Xavier, a St Charles Borromeo, a St Philip Neri, a St Francis de Sales, a St Vincent de Paul, and many other saints of more recent times. And whoever is acquainted with the rigorous inquiry which precedes the process of canonisation, whatever he may think of the faith of those canonised by Rome, will admit that the saints of the Roman Church were men of even heroic virtue.—The Roman Catholic Church claims to visibly possess the third property of the true church—viz. *catholicity*. She claims to be Catholic *de jure*, inasmuch as she was commissioned to 'teach all nations;' and also *de facto*, and this in three ways. (1) With respect to persons. This means that Roman Catholics constitute by far the most numerous body of Christians. (2) With respect to place. This means that the Roman Catholic religion is more or less diffused wherever Christianity prevails. (3) With respect to time. This means that she has existed visibly since the days of the apostles, and that she will exist visibly till the end. The claim of continued existence from the first really merges into the claim of apostolicity, which we shall next explain. Her belief in her continuance of existence till the end she bases on Christ's promise of constant assistance, which she declares was made to herself.—Finally, the Church of Rome claims to possess visibly the fourth property of the true church—*apostolicity*. She claims to be apostolic (1) as founded by Christ through the apostles, and because her pastors descend from the apostles by a succession which has never been broken. Under this head we may remark that, while many Protestant writers have denied that St Peter the apostle ever resided in Rome, on the other hand many well-known Protestant authorities, such as Barrow, Cave, Chamier, Vossius, Baratier, Bishop Pearson, and Whiston, have freely conceded this to the Catholics. Whiston states that the fact of St Peter's residence at Rome 'is so clear in Christian antiquity that it is a shame for any Protestant to confess that any Protestant ever denied it.' Bishop Pearson declares that 'it is wonderful that those can be found who deny that Peter ever was at Rome.' Baratier is still more emphatic: 'All the ancients,' he writes, 'and the great majority of the moderns have undertaken to derive the succession of the bishops of Rome from the apostle Peter. So great in this matter has been the agreement of all that in truth it ought to be deemed a miracle that certain persons born in our day have presumed to deny a fact so manifest.' Besides claiming connection with the apostles, by a line of pastors descending from them in uninterrupted succession, the Church of Rome claims to be apostolical (2) by reason of her doctrines. She denies that she has ever surrendered any doctrine taught by the apostles, and she denies that she has ever professed any doctrine which is not contained in divine apostolical tradition. Here it must be remembered that, while the Church of Rome accepts the Word of God alone and exclusively as the Rule of Faith, besides the Sacred Scriptures or written Word of God it admits an unwritten Word of God, which possesses an authority equal to that of the written Word. By the unwritten Word of God Roman Catholics understand a body of truths delivered by Christ to the apostles, and by the apostles to their successors, and which were not in the first instance committed to writing. It is certainly worthy of note that Christ did not write, but preach; that he did not command his apostles to write, but to preach; that only five out of the twelve apostles—reckoning St Mathias in the place of Judas—are recorded to have written anything at all; that three out of these five—St Peter, St James, and St Jude—have left us nothing more than brief epistles, written under particular circumstances, and for special reasons; that more than half of the New Testament was written by inspired men who were not among the apostles to whom the commission was addressed by our Saviour. The church is the depositary, guardian, and living and infallible interpreter of both the written and the unwritten Word of God. It may be remarked, in passing, that there would seem to be some analogy between the Roman Catholic rule of faith and the civil constitution of England. According to Judge Blackstone's Commentary, the municipal laws of England are divided into *lex non scripta*, the unwritten or common law, and the *lex scripta*, or statute law; and the common law is the 'first ground and chief corner-stone of the laws of England.' If the question arises as to how these customs or maxims are to be known, and by whom their validity is to be determined, Blackstone decides that the question must be settled by the judges in the several courts of justice, for these judges are 'the depositaries of the law, the living oracles, who must decide in all cases of doubt.'

The Church of Rome teaches that no addition has ever been made to the deposit of faith left by the apostles to the church, and that no objective increase of revelation is to be expected. She does not deny that divine revelations have been made to individuals since the days of the apostles, but she holds that such revelations do not increase the deposit of Christian revelation, and do not constitute an article of Catholic faith to be professed by all the faithful. The faithful are not bound to accept revelations made to private persons, even though the church should express approval of these revelations; for it is understood that the church does not intend by her approval to guarantee their genuineness. The approval of the church amounts to no more than a declaration that there is nothing in the supposed revelations at variance with sound faith and morality. But though the entire deposit of faith was received by the church from the apostles, it does not follow that all the truths contained in this deposit were revealed *explicitly*, and have been at all times *explicitly* taught by the church. There has, indeed, never been any difference with respect to the *formal* object, as it is called, or motive of faith. Whatever truth has been believed has always been accepted on the authority of God who revealed it. But with respect to the *material* object of faith—i.e. the truths of revelation—there has been this difference, that, while some have been from the first explicitly believed, others were at one time believed implicitly only. The distinct proposition and promulgation of these latter doctrines belongs to the *magisterium*, or teaching office, which the church exercises under the guidance of the Holy Spirit.

The church fulfils this teaching office in many ways: (1) By indicating in detail the various truths contained in some complex article of explicit faith. Thus, it was always expressly believed by the church that our Saviour was a true and perfect man. But if our Saviour was truly man it follows that He possessed a human body, a rational soul, a human will, and a human energy. And these various consequences the church distinctly proposed for explicit belief, on the emergence of the Gnostic, Apollinarian, Monothelite, and other heresies at variance with these consequences. Or, to take an instance from Roman Catholic theology, the plenitude of the primacy of the Bishop of Rome has always been a principle of faith explicitly believed. But, as occasions and circumstances required, the church has proposed for explicit faith one or other of the prerogatives involved in this primacy. (2) By enunciating in particular truths already comprehended in some universal proposition of explicit faith. Thus, while the church had already taught that grace was necessary for all salutary actions and states, on occasion of the Semipelagian heresy it distinctly decreed that grace was necessary for entrance into the way of salvation and for perseverance in the same. (3) By proposing distinctly and articulately what was already believed, though with less distinctness. Thus, according to Roman Catholics, it has always been the belief of the church that it was due to the honour of the Son of God that His mother should be free from the least stain of sin. The proclamation, then, in recent years of the doctrine of the Immaculate Conception was no more than the distinct and articulate declaration of a truth which had been an object of implicit belief from the first. (4) By expressly declaring some truths which had been already indicated by the practice of the church. Thus, the church, by not rebaptising those converted to her fold from heresy, had practically manifested her belief in the validity of baptism conferred by heretics; but when the validity of heretical baptism was impugned she expressly declared that where the proper matter, form, and intention were employed such baptism was valid. Thus, then, according to the Roman Catholic teaching, there may be truths objectively contained in the deposit of revelation, or the remote rule of faith, which have not been always clearly proposed and promulgated by the proximate rule of faith—i.e. the *magisterium* of the church. Until they are thus proposed and promulgated they may be called in question without loss of faith; for the unity of faith is maintained so long as there is due subjection to the *magisterium* of the church. In the history of many doctrines we may distinguish three distinct phases: (1) In the first instance, they are implicitly contained in revelation indeed, but not yet proposed by the church; and by the faithful they are not explicitly believed, neither are they called in question. (2) Then arises a controversy concerning these doctrines; some are for accepting, others for rejecting them. (3) Finally, the church, either by solemn judgment or by her common teaching, declares that these doctrines belong to the deposit of revelation; and thenceforward they are an object of explicit faith.

For the teaching of the Roman Catholic Church concerning the Holy See we must refer our readers to the articles POPE, INFALLIBILITY, &c. We may, however, mention here that the very name Roman Catholic is intended as an expression of the belief that there can be no true Catholicity without union with Rome. Roman Catholics assert that there can be no catholicity without unity; and they contend that the See of Rome has always been regarded as the source of unity, and that communion with Rome was regarded by the early church as the ultimate proof of orthodoxy. In support of this contention they quote many striking declarations of the Fathers and of the early councils. The name 'Roman Catholic' is not new. Cardinal Newman, writing of the 5th and 6th centuries, says: 'It is more than remarkable that Catholics of this period were denoted by the additional title of "Romans." Nor was this association of Catholicism with the See of Rome an introduction of that age' (*Essay on Development*, chap. v.).

The hierarchy of the Roman Catholic Church consists of the sovereign pontiff, who is assisted by the Sacred College of Cardinals, and by several sacred congregations, or permanent ecclesiastical committees; of the patriarchs, archbishops, and bishops; of the apostolic delegates, vicars, and prefects; and of certain abbots and prelates. The cardinals, who are the advisers and assistants of the sovereign pontiff, constitute the supreme council or senate of the church; and on the death of the pontiff they elect his successor. The College of Cardinals when complete consists of 70 members: 6 cardinal bishops, whose dioceses are the 6 'Suburban Sees' of Ostia and Velletri, Porto and Santa Rufina, Albano, Frascati, Palestrina, and Sabina, 50 cardinal priests, and 14 cardinal deacons. In January 1891 there were 64 cardinals, of whom 36 were Italian; 9 Austrian, German, or Polish; 6 French; 4 British subjects; 4 Spanish; 2 Portuguese; 1 of the United States; 1 Belgian; and 1 Swiss. The sacred congregations, about 20 in number, consist of cardinals, consultors, and officials, and carry on the central administration of the Roman Catholic Church. The following are the principal congregations. (1) The Congregation of the Council, for the interpretation and execution of the decrees of the Council of Trent, and for receiving from bishops reports on the state of their dioceses. Attached to this there is a special Congregation for the Revision of Pro-

vincial Synods. (2) The Congregation of Bishops and Regulars, for judging appeals against episcopal sentences, for the hearing of causes between bishops and regulars, and for the revision and approbation of rules of religious bodies. (3) The Congregation of Propaganda, for the propagation of the faith and the government of the church in non-Catholic countries. Attached to this there is a Congregation for Affairs of the Oriental Rite, with a commission for the revision and correction of Oriental books. (4) The Congregation of Sacred Rites, for the decision of all questions relative to the liturgy, rites, and ceremonies, and for the conduct of the processes of the beatification and canonisation of saints. (5) The Congregation of the Index, for the condemnation of writings prejudicial to faith or morality. (6) The Congregation of the Holy Office, sometimes known as the Congregation of the Inquisition, for the examination and repression of heretical doctrines. (7) The Congregation of Indulgences and Sacred Relics, for the proclamation of indulgences and the decision of questions relating to them, and for the authentication and distribution of relics. (8) The Congregation of Ecclesiastical Immunity, for maintaining ecclesiastical privileges and exemptions, as to persons, places, and things. The jurisdiction of the congregations does not cease on the death of the sovereign pontiff; nevertheless all important business is suspended during the vacancy of the Holy See.

There are 10 patriarchates, with 13 patriarchal sees—8 of the Latin rite, and 5 of Oriental rite. The greater or more ancient patriarchates are those of Alexandria, *Latin;* Antioch, with 4 patriarchal sees, *Latin, Maronite, Melchite,* and *Syriac;* Constantinople, *Latin;* and Jerusalem, *Latin.* The less are those of Babylon, *Chaldaic;* Cilicia, *Armenian;* East Indies, *Latin;* Lisbon, *Latin;* Venice, *Latin;* and West Indies, *Latin.* There are in the communion of Rome, besides the 13 patriarchal sees, 871 archiepiscopal and episcopal *residential* sees of the Latin rite, and 76 archiepiscopal and episcopal residential sees of Oriental rite. Besides the archbishops and bishops of these residential sees, there were in January 1891 308 archbishops and bishops of *titular* sees. In the British empire there are 123 Roman Catholic residential archiepiscopal and episcopal sees, 23 vicariates-apostolic, and 8 prefectures-apostolic, with a Roman Catholic population of about 10 millions. Nineteen of the 23 vicariates-apostolic in the British empire are held or administered by bishops of titular sees. Titular sees, or, as they were styled till 1882, sees *in partibus infidelium*—i.e. sees which in ancient times existed in those eastern regions which have now lost the faith and fallen into barbarism—are, for the most part, assigned to archbishops and bishops who are appointed to apostolic delegations, of which there are 7, or to vicariates-apostolic, of which there are 118, or to prefectures-apostolic, of which there are 37, or to the office of coadjutor, auxiliary, or administrator of a diocese. Delegates-apostolic and vicars-apostolic enjoy episcopal jurisdiction, and exercise episcopal powers, in countries where a hierarchy proper has never been established, or having once existed has been suppressed. When the ancient hierarchy of England came to an end in 1585 with the death of Thomas Goldwell, Bishop of St Asaph, the English Catholics were at first placed under the jurisdiction of archpriests or prefects-apostolic. But in the year 1623 Pope Gregory XV. appointed a vicar-apostolic with jurisdiction over all the Catholics of England. About sixty years later, in 1688, Pope Innocent XI. created four districts or vicariates, the London, Midland, Northern, and Western, appointing to each district its own vicar-apostolic. In 1840 Pope Gregory XVI. created eight districts or vicariates, the London, Western, Eastern, Central, Welsh, Lancashire, Yorkshire, and Northern, each district having, of course, its own vicar-apostolic. In 1850 Pope Pius IX. re-established the Roman Catholic hierarchy in England. The vicars-apostolic were all bishops of titular sees. Thus, Cardinal Wiseman, who before the restoration of the hierarchy was vicar-apostolic for the London district, was entitled while vicar-apostolic Bishop of Melipotamus. Prefects-apostolic are as a rule not bishops, but simple priests, who receive from the Holy See authority to exercise *quasi*-episcopal jurisdiction in missionary countries.

As is well known, the Latin rite prevails with few exceptions in the West, and also in some regions of the East; nevertheless various other rites are also followed within the communion of Rome. These are (1) the Greek rite, of which there are the following forms. (*a*) The Greco-Roumanian. There are 3 bishops and 1 archbishop of this rite, whose sees are situated in Austria-Hungary. The language of the liturgy is Roumanian, excepting in the parish of Scaiusiu, in the diocese of Lugos, where the language employed is the ancient Slav. (*b*) The Greco-Ruthenian. There are 8 bishops and 1 archbishop of this rite, with sees in Austria-Hungary and Russian Poland. The liturgical language is the ancient Slav. (*c*) The Greco-Bulgarian. Of this rite there is an archbishop, vicar-apostolic, for Constantinople and its neighbourhood, with 2 bishops, vicars-apostolic, for Macedonia and Thrace. The liturgical language is ancient Slav. (*d*) The Greco-Melchite. Of this rite is the Melchite patriarch of Antioch, with 4 archbishops and 9 bishops, whose sees are situated in Syria. The liturgical language is the Arabic. There are missions at Cæsarea in Cappadocia, Constantinople, and Malgara in Thrace of the pure Greek rite, which are also in communion with Rome. (2) The Syriac rite, of which there are the following forms. (*a*) The pure Syriac. Of this rite is the Syriac patriarch of Antioch, with 4 archbishops and 8 bishops, whose sees are situated in Egypt, Syria, and Turkish Armenia. The liturgical language is the ancient Syriac. (*b*) The Syro-Chaldaic. Of this rite is the patriarchate of Babylon, with 4 archiepiscopal and 7 episcopal sees situated in Kurdistan, Turkish Armenia, Mesopotamia, and Persia. The liturgical language is the ancient Chaldaic. (*c*) The Syro-Maronite. Of this rite is the Maronite patriarch of Antioch, and 7 archbishops and 2 bishops, whose sees are situated in Syria, in various other provinces of Asiatic Turkey, and in the island of Cyprus. The liturgical language is the ancient Syriac. (*d*) The Syro-Malabaric. This rite is followed in the vicariates-apostolic of Kottayam and Trichur in the East Indies. The liturgical language is the Syro-Malabaric. (3) The Armenian rite. To this rite belong the Armenian patriarchate of Cilicia, the archiepiscopal see of Lemberg in Austria-Hungary, the episcopal see of Artuin in the Russian empire, and 17 episcopal sees situated in Turkish Asia, Egypt, and Persia. The language of the liturgy is the ancient Armenian. (4) The Coptic rite. Of this rite there are two forms: (*a*) the form followed in the vicariate-apostolic situated in Egypt, where the Coptic or ancient Egyptian is the language of the liturgy; (*b*) the form observed in the vicariate-apostolic in Abyssinia, where the liturgical language is the ancient Ethiopic or Geez.

The Roman Catholic populations of the various countries of Europe are, according to *The Statesman's Year-book* (1891), as follows: Great Britain and Ireland, 5,640,891; Austria-Hungary, 25,591,000; Belgium, 6,079,798; Denmark, 2985; France, 29,201,703; German Empire, 16,785,734; Greece,

about 12,000; Italy, 28,853,480; the Netherlands, 1,439,137; Portugal, 4,707,678; European Russia, 8,300,000; Spain, 17,529,860; Sweden and Norway, 1329; Switzerland, 1,190,008. For European Turkey accurate statistics are not given, but the number of Roman Catholics has been estimated at 1,000,000. Thus the total Roman Catholic population in Europe amounts to 146,335,603. According to Werner's *Atlas des Missions Catholiques* (Freiburg, 1886), the Roman Catholic populations of the other continents are as follows: Asia, 9,234,000; Africa, 2,656,000; America, 51,033,790; Australia and Polynesia, 672,000. Thus the total Roman Catholic population of the world amounts to nearly 210,000,000.

See Cardinal Manning's *Temporal Mission of the Holy Ghost;* Newman's *Essay on Development of Doctrine;* Wiseman's *Lectures on the Catholic Church;* Ward's *Essays on the Church's Doctrinal Authority;* Murphy's *Chair of Peter* (1888); Leibnitz's *System of Theology*, translated by Russell (1850); *Catholic Directory* (Burns and Oates); *Missiones Catholicæ* (Propaganda Press, Rome). The organisation and statistics of the Catholic Church will be found in the relevant paragraphs on the several Catholic countries. The more important Catholic doctrines and institutions are all dealt with in separate articles in this work; as are also the saints and thinkers. See especially the articles:

Romance Languages, a general name for those modern languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia. When the Roman empire was broken up by the irruptions of the northern nations (in the 5th and 6th centuries) the intruding tribes stood to the Romanised inhabitants in the relation of a ruling caste to a subject population. The dominant Germans continued, where established, for several centuries to use their native tongue among themselves; but from the first they seem to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and at last the language of the rulers was merged in that of their subjects; not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution therefor of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (*lingua Romana rustica*) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue—but chiefly by slovenly pronunciation, the neglect or misuse of grammatical forms, and the use of 'low' and unusual words and idioms. As distinguished from the old *lingua Latina*, the language of the church, the school, and the law, this newly-formed language of ordinary intercourse, in its various dialects, was known from about the 8th century as the *lingua Romana;* and from this name, through the adverb *Romanicé*, came the term Romance, applied both to the language and to the popular poetry written in it, more especially to the dialect and poems of the troubadours. The Romance languages recognised by Diez are six—Italian, Spanish, Portuguese, Provençal, French, and Roumanian. Ascoli and newer investigators treat the Romansch of the Grisons as a seventh sister-tongue; and each of these have more or less numerous dialects.

According to the theory of Raynouard, the new language that sprang out of the corruption of the Latin was at first essentially the same over all the countries in which Latin had been spoken, and is preserved to us in a pure state in the Provençal, or language of the troubadours; and it was from this as a common ground, and not from the original Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by recent inquirers; its groundlessness was demonstrated by Cornewall Lewis. It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superseded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, as was to be expected, is richer in German words than any other member of the family, having 450 not found in the others. Italian is next to French in this respect, but on the whole is nearest to the mother Latin. Spanish and Portuguese have considerable Arabic elements; and Roumanian was much modified by Slavic. The Romance tongues further differ from the common parent in simplifying or dropping the inflections of nouns, substituting for these the use of prepositions, and simplifying the verbal forms by a free use of auxiliary verbs. The six great Romance tongues and their literatures are treated in the articles on Italy, Spain, Portugal, Provençal, France, and Roumania, to which may be added the Romansch.

See Cornewall Lewis, *On the Origin and Formation of the Romance Languages* (2d ed. 1862); Diez, *Grammatik der Romanischen Sprachen* (1836–38; 4th ed. 1877), and his dictionary, the great *Wörterbuch* (1853; Eng. trans. 1864); Paul Meyer, *Rapport sur le Progrès de la Philologie Romane* (1874); works on Romance philology by Körting (1884), Gröber (1886), and Neumann (1886); the magazine 'Romanische Studien' (1871 *et seq.*), and that of Gaston Paris, 'Romania' (1873 *et seq.*).

Romances. Romance has long since lost its original signification in every country except Spain, where it is still occasionally used in speaking of the vernacular, as it was in the middle ages when Latin was the language of the lettered classes and of documents and writings of all kinds. But even there its commoner application is, as elsewhere, not to a language, but to a form of composition. In English it has been almost invariably applied to a certain sort of prose fiction, and, in a secondary

sense, to the style and tone prevailing therein. By 'the romances,' using the term specifically, we generally mean the prose fictions which, as reading became a more common accomplishment, took the place of the lays and *Chansons de geste* (q.v.) of the minstrels and trouvères, and were in their turn replaced by the novel. Of these the most important in every way are the so-called romances of chivalry, which may be considered the legitimate descendants of the *chansons de geste*. The chivalry romances divide naturally into three families or groups: the British (which, perhaps, would be more scientifically described as the Armorican or the Anglo-Norman), the French, and the Spanish; the first having for its centre the legend of Arthur and the Round Table; the second formed round the legend of Charlemagne and the Twelve Peers; and the third consisting mainly of Amadis of Gaul followed by a long series of sequels and imitations of one kind or another. In strict chronological order the Charlemagne cycle should stand first, for the Charlemagne legend was apparently of an earlier formation than the Arthurian; but on the other hand the materials out of which the Arthur legend shaped itself must of course have been the older, and the prose romances which either grew out of it or were grafted upon it are for the most part of an earlier date than those belonging to the Charlemagne story.

The first appearance of Arthur is in the history of Nennius, where he is presented in a quasi-historical shape, simply as the chosen leader of the Britons in twelve successful battles fought with the Saxons; but it is in the *Historia Regum Britanniæ* of Geoffrey of Monmouth (1140) that he first appears as the hero of a connected story. Geoffrey, in fact, may be fairly claimed as the founder of the Arthurian legend. Whatever his materials may have been or whatever the source from which he obtained them, he contrived to give them 'un caractère chevaleresque et courtois,' to use the words of M. Gaston Paris, which was altogether foreign to them when they came to his hands, and thus succeeded in presenting a picture of Arthur and his court which at once proved acceptable to the age in which he lived. It is this character, impressed upon the Arthur legend by Geoffrey, that led Cervantes to regard it as the fountain-head of chivalry and chivalry romance, as he does in *Don Quixote* (part 1, chap. xiii.). The story, however, as Geoffrey left it, is little more than the foundation of the structure raised by his successors a century later. Whether we accept in its entirety or in part only his account of the 'very ancient book' from Brittany which he professed to have translated, or hold that his authorities were simply Nennius, Welsh traditions, and Breton lays and tales, it is clear that his sources of information conveyed no hint of the Round Table or of the Grail, to say nothing of Lancelot and other personages who have come down to us as part and parcel of the Arthurian story. The first reference to the Round Table is in the *Brut* of Wace (1155), which is in fact an amplified metrical version of Geoffrey's history, and from the words used—'Fist Artus la roonde table, dont Breton dient mainte fable'—we are left to suppose that it was through Breton tradition that it found its way into the story. By some it has been conjectured that in the Round Table we have only an imitation of the Peers of the Charlemagne legend, but in truth the two institutions represented two totally distinct ideas. The peers were simply a fraternity, 'xii. cumpaignuns,' as the Chanson de Roland calls them, bound together by mutual affection alone, with no ulterior aim or object, and entirely uninfluenced by the sovereign. The Round Table, on the other hand, was a knightly fellowship in which the bond of union was the pursuit of chivalrous adventures and 'deeds of worship,' of which the king was the head, and by which he was 'upborne' and the quiet and rest of his realm insured. The distinction deserves notice, for it is characteristic of the difference between the two legends and the romances that represent them. The Arthurian stories were knightly and courtly, their authors were courtiers, sometimes knights—if we may trust the statements of early editors, they were written to order at the instance of magnates, among whom Henry II. and Henry III. of England are named, and at any rate were obviously addressed to what would now be called the aristocratic section of society. With the Carlovingian it was very different; the *chansons de geste* from which they were derived were made for and sung to no one class in particular, and it is manifest that the selection for translation into prose was always governed by considerations of popular interest. Hence the phenomenon noticed by more than one observer, that the Arthurian stories have never become in the strict sense of the word popular in any age or country, while the Carlovingian have enjoyed a wide-spread popularity, and in some instances continued to hold their own as popular stories down to the present day. Mr J. A. Symonds observes that in Italy the Arthurian stories, though relished by the cultured classes, never took the fancy of the people at large in the same way as the Carlovingian; and in Spain the romances and ballads that treat of Arthur are few and meagre, while the Charlemagne literature is extensive and rich, and the *History of Charlemagne and the Twelve Peers* is still a current chap-book in high request. A more obscure question is how the Holy Grail came to be linked to the Arthurian story. There can be no doubt that Celtic tradition and mythology present sufficient analogies to justify a theory that the idea of the Grail is a purely Celtic one which may be traced back to pagan times. But none of these analogues, not Fionn's healing cup or the mystic basin which figures in *Peredur*, can be in any true sense called a Grail. The essence of the Arthurian Grail lies in its character of a Christian relic, and the very name suggests that the conception as it is there presented to us was an Anglo-Norman one. It is very possible, no doubt, that Celtic tradition may have had a share in shaping the conception, but that is all that can be safely said. Some little light, perhaps, is thrown on the question by the curious coincidence between the book presented in a vision in the year 717, which Robert de Borron (*circa* 1190) sets up as the prime authority for his Sainct Greal, and the vision in the same year in which the Grail itself was seen by a British hermit, as recorded by Helinand in 1204. The return of the first Crusaders stimulated that enthusiasm for relics of the Passion of which we have a proof in the Sacro Catino at Genoa and its rivals. A very natural consequence would be an eagerness to discover the hiding-place of the true catino, and this, when the Round Table idea had been once imported into the Arthurian story, would furnish the 'deed of worship' *par excellence* necessary to its constitution, while an equally natural consequence would be that the poets in working out the idea would avail themselves of any floating traditions of mystic vessels endowed with miraculous properties which could be pressed into their service. Arthur himself has, no doubt, been treated in the same fashion. Hero-worship is almost always accompanied by annexation. The Charlemagne legend is largely made up of fragments that properly belong to Charles Martel, Pepin, and Charles the Bald. Even in the comparatively modern case of the Cid, one of the most famous exploits, the unseating of the

French ambassador, is in reality the property of the 15th-century Conde de Cifuentes. It would be strange if so remote a figure as Arthur's did not show signs of some such process; but even if we find there, as Professor Rhys holds, traces of the culture hero, or of the solar myth, the question of his personality cannot be said to be thereby affected. It would be almost as unreasonable to treat him as a purely mythical being on such grounds, as to deny Sheridan's existence because jokes attributed to him are to be found in early editions of Joe Miller. There is very little certainty connected with the construction of the Arthurian story. It seems plain that the History of the Grail, which properly should precede the Quest, was in reality a later composition; and the respective shares of Chretien de Troyes and Robert de Borron in the Grail, Perceval, and Lancelot are pretty clearly defined. But in most other respects the Arthurian cycle deserves the title M. Gaston Paris applies to it of 'dédale inextricable.' In no case, as Mr Alfred Nutt says, do we possess a primary form; all the versions that have come down to us presuppose something earlier; all is uncertainty, the order in which the component parts were produced, the sources from which they were derived, the authors to whom they are attributable, the relationships of the various versions and forms one to another; and research seems ever to reveal new nebulæ and discover fresh clusters of difficulties. Even on the question as to whether the primary form was in verse, as analogy would lead us to expect, we are for the most part left to conjecture. That Breton popular poetry may have contained the germs of Tristram, Perceval, and Lancelot is no doubt a probability; but of one thing at least we may be certain, that veritable creations like the Lancelot of the Arthur story could have had no place in the simple naïve *lais* of which we have examples in the translated specimens of Marie de France. The stones may have come from a Celtic quarry, but the building was Anglo-Norman.

It was inevitable that the Arthur stories proper should be followed by romances claiming a supplementary or an introductory character, such as *Meliadus*, *Guiron le Courtois*, *Artus de Bretagne*, and *Perceforest*, but it would be an injustice to treat these, as Dunlop has done, as though they were legitimate members of the Arthurian cycle, nor have they been admitted into it by the compilers or arrangers who have now and then attempted to present it in a consecutive shape. *Facile princeps* of these is our own Sir Thomas Malory, whose work is, as Dr Sommer says in his masterly edition, 'by far the best guide to the Arthur romances in their entirety.' Malory's judgment may not be, perhaps, invariably impeccable. He has not always chosen the best or most poetical form, and he has left unculled many beauties of the old MSS. But this may not have been so much his fault as that of the materials with which he had to content himself. Of his general good taste and literary skill there can be as little question as of his English which has made his book one of the classics of his language. Malory, furthermore, as the exhaustive researches of Dr Sommer show, is the sole authority for portions of the series, in particular the story of Gareth in the seventh book. See ARTHUR, GRAIL.

In the romances of the Charlemagne cycle we stand on much firmer ground. It is true that we know even less of the authors than in the case of the Arthur stories, but on the other hand the whole process of production lies plain to view. The starting-point of the legend is undoubtedly the disaster of Roncesvalles, and the *Song of Roland*—not, of course, the *Chanson de Roland* that has come down to us, but some older form, the existence and nature of which are matters of inference—may be taken as the foundation of the whole Charlemagne cycle of romance (see ROLAND). Of this, apparently, we have a prose version at the end of the Latin history of Charlemagne, which pretends to be the work of his contemporary the Archbishop Turpin. Nothing was farther from the intention of the writers than to produce a romance; but among the romances, or at the head of them, their work must be placed. About its intention there can be no mistake. By Charlemagne's example it points out the advantages here and hereafter of serving the church liberally and zealously, endowing holy shrines, encouraging pilgrimages, converting the heathen or exterminating them when unconvertible. It records a military pilgrimage to Compostella made by Charles at the call of St James, and is plainly the work of different hands. M. Gaston Paris believes the first five chapters to have been written by a monk of Compostella about 1050; but it is not very obvious why a Spaniard who had his own national legend of Compostella should have gone out of his way to make a patron of a foreigner and an invader. The remainder, he thinks, was written by a monk of Vienne between 1109 and 1119. The book was soon translated into French, and became the chief source of the story of Roland and Roncesvalles, for which it was believed to be the prime authority until the discovery of the *chanson* proved the existence of a common ancestor. The influence of the latter was mainly through the *chansons de geste* of which it was in most cases the model. Of these the number is large. M. Leon Gautier's list enumerates above a hundred belonging to the Charlemagne cycle, and this of course only represents survivors. Only a few, however, gave birth to prose romances. The Roland had been forestalled by the Turpin history, and of the others the majority were in interest too local, not sufficiently popular, or for other reasons unsuitable for prose. The story of Ogier le Danois (who possibly had nothing to do with Denmark, but was merely warden of the Ardenne-mark) was too famous to be left in the verse of Adenes le Roy; the traditions of the struggles between the sovereign and his vassals in Aquitaine, not so much in Charlemagne's time as in Pepin's, lent an interest to Renaud de Montauban, the Rinaldo of Italian poetry, but best known as the hero of the *Four Sons of Aymon* (q.v.), a romance that has probably never been out of print since the introduction of printing; and similar reasons, more or less strong, influenced the selection of *Doon de Mayence*, *Maugist d'Aygremont*, *Guerin de Montglave*, *Mille et Amys*, *Jourdan de Blaves*, *Galien Rhetoré*, and divers others. One of the most notable, independently of its connection with Don Quixote, is *Fierabras*. In the 15th century it was translated into prose by one Jean Baignon of Lausanne, who prefixed to it the early account of Charlemagne by Vincent de Beauvais, and added the concluding chapters of Turpin with the Roncesvalles story, the whole forming a kind of consecutive Charlemagne romance resembling the Arthur compilations. In this shape, and under the title of *La Conqueste du grant roy Charlemaigne des Espaignes*, it achieved extraordinary popularity, became a regular chap-book, was translated into Spanish by Nicolas de Piamonte, whose version supplied the balsam of which Don Quixote made trial, and from Spanish into Portuguese about the middle of the 18th century; when it was supplemented by an entirely new Charlemagne romance by the translator, a curious proof of the vitality of the legend.

From the lays of the minstrels of the same period there came also many independent prose romances not necessarily connected with any particular cycle: *Valentine and Orson*, which, however, is

sometimes linked with the Charlemagne cycle; *Cleomades*, or *Clamades*, where Cervantes found the magic wooden horse, which by a lapse of memory he assigns to *Pierre of Provence and Magalona*, another romance of the same kind; *Partenopeus of Blois; Melusina; The Knight of the Swan*, in some respects the most interesting of all, and curious as an illustration of the growth of a romance. Originally a folklore legend of Brabant, the source of *Lohengrin*, the story was turned into a poem and incorporated in the series on Godfrey de Bouillon, who was made a descendant of the Knight of the Swan; then it was annexed by Vincent de Beauvais for his *Speculum Historiale*, from which it passed into the shape of a romance, and was translated into English at the instigation of Edward, Duke of Buckingham, who claimed to be one of the knight's descendants.

Cervantes correctly claims *Amadis de Gaula* as the founder of Spanish chivalry romance, though he may have been in error as to its being the first work of the kind printed in Spain; the Valencian *Tirant lo Blanch* must have preceded it. It was long held to be of Portuguese origin on the bare statement of Gomez de Azurara that it was entirely the work of Vasco de Lobeira; but there is ample proof that an Amadis was extant in Spain at least as early as the middle of the 14th century, very probably as early as 1300, but at any rate before Lobeira was born. Southey, in whose time the evidence was not forthcoming, may be excused for asserting the Portuguese origin of the romance; but it is strange to find M. Gaston Paris still describing it as 'portugais puis espagnol aux XV^e^ et XVI^e^ siècles.' Whether this Amadis was in verse or in prose is uncertain; we only know from one witness that it was in three books, and Garci de Montalvo, who is responsible for the existing Amadis, merely claims to have corrected three books, which previous editors and scribes had left in a corrupt state, and to have added a fourth. Nor is it a certainty that it was of purely Spanish origin. The influence of the Arthurian romances is manifest, but what is far more suspicious is the absence of Spanish colour and indications of Spanish parentage; the names are almost all akin to those of the Arthur stories, the fay Urganda is a distinctly Celtic creation, and the scene throughout is laid on Arthurian ground, Wales, England, Brittany, or Normandy, a choice not easily explained in a romancer whose business was to interest Spanish hearers or readers. But whether or not the original may have been some northern French story, it certainly was not, as has been sometimes suggested, *Amadas et Ydoine* in which there is no more resemblance to *Amadis* than there is in *Aucassin and Nicolette*.

The earliest known edition of the *Amadis* (q.v.) is of 1508, but this cannot be the first; it is too near the date of other romances obviously inspired by it and born of its success, and it is evident that it was finished shortly after the fall of Granada in 1492. The date is significant in its bearing on the curious phenomenon of the sudden outburst of a chivalry romance literature in Spain, just as the middle ages were drawing to an end and other nations were beginning to put away chivalry among the *bric-à-brac* of bygone days. But in Spain it marked the close of a campaign of seven centuries and the end of a national life of sustained excitement. Under the new order of things, the triple despotism of crown, church, and Inquisition, the nobles and minor nobility were left with a superabundance of leisure on their hands, a condition, as every seaside librarian knows, always favourable to the circulation of fiction, so that Montalvo could not have chosen a better time for his venture. But it would be unjust in the extreme to deny to the merits of the *Amadis* their share in the creation of Spanish chivalry romance. In almost every respect, story, incidents, characters, and human interest, it will bear comparison with the best of its predecessors, and as a romance of chivalry, pure and simple, it has no equal. In this lay the secret of its success. For Spain chivalry romance had a reality unknown elsewhere. *Amadis* came to a generation which had seen round Ferdinand and Isabella knights who could match any of Arthur's or Charlemagne's in exploits. Coming at such a time it is no wonder that *Amadis* was followed by a cry for more, and that more was promptly supplied. But *Esplandian*, *Florisando*, *Lisuarte*, *Amadis of Greece* were of a very different vintage. It was by Feliciano de Silva, the object of Cervantes' special detestation, that the work of continuation was chiefly carried on. He was a clever man, with a facile pen, and if not imagination, at least invention in abundance, but his greatest gift was his intuitive perception of the tastes of his readers. He perceived that it was not so much recreation as excitement they wanted, and that so far from objecting to rant, bombast, and extravagance, the more they got the better they were pleased. He seems to have been the first author who reduced writing nonsense to a system, and also the first who made a handsome fortune by his writings. The professed continuations formed, however, only a small portion of the romances, more or less in imitation of the *Amadis*, and infected by the style of Feliciano de Silva, the *Felixmartes*, *Belianises*, *Olivartes*, which continued to flow from the press until the long line ended with *Policisne de Boccia*, two years before *Don Quixote* was sent to the press.

With *Don Quixote*, fittingly, the history of romances as a branch of fiction comes to a close. There are, indeed, two other groups that claim the title, the Pastorals, and those sometimes called the Heroic, an epithet better deserved by the readers who were bold enough to face entertainment in such a formidable shape. But to these quite as much space as their merits entitle them to has been already given (see NOVELS).

Roman de Rou. See WACE.

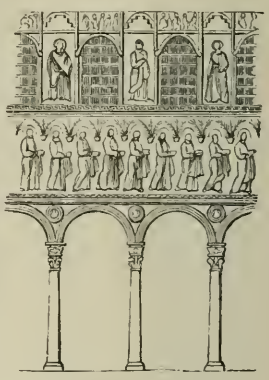
Roman Empire, HOLY (more fully in German, *Heiliges Römisches Reich Deutscher Nation*), the official denomination of the German empire from 962 down to 1806, when Francis II. of Hapsburg resigned the imperial title. The Western Roman empire came to an end in 476 A.D.; Charlemagne sought to reconstitute it when he was crowned

emperor at Rome by Pope Leo III. in 800. But the reconstituted empire fell again into fragments and chaos, till Otho the Great succeeded in making a great monarchy again, and was crowned emperor by Pope John XII. at Rome in 962. Thenceforward for more than eight centuries there was an unbroken succession of German princes claiming and in a measure exercising the powers and privileges of Roman emperors. The name of 'Roman emperor' was carefully retained; 'Holy' was added to signify that the empire was now Christian; and 'of the German nation' was sometimes appended to indicate the new nationality that dominated over the old imperial realms. The emperor was the official head of the Christian world, the temporal colleague and rival of the pope. The new German empire (since 1871) calls itself simply German, and has dropped all claim to be either 'Roman' or 'Holy.' See GERMANY, Vol. V. p. 180; CHURCH HISTORY; and Bryce's great monograph, *The Holy Roman Empire* (new ed. 1889).

Romanes, GEORGE JOHN, naturalist, was born at Kingston, Canada, on 20th May 1848, and after a private education in London and on the Continent entered Caius College, Cambridge, and graduated in 1870 with natural science honours. While still at the university he formed a friendship with Darwin, and he has powerfully reinforced his master's arguments in his Croonian, Fullerian, and other lectures, and in his various works—*Animal Intelligence* (1881); *Scientific Evidences of Organic Evolution* (1881); *Mental Evolution in Animals* (1883); *Jelly-fish, Star-fish, and Sea-urchins* (1885); *Mental Evolution in Man* (1888); *Darwin and after Darwin* (1892); *Examination of Weismannism* (1893; see WEISMANN). This most fertile English writer on the theories and philosophy of modern biology died 23d May 1894. His posthumous *Thoughts on Religion*, edited by Canon Gore, showed that, once a defiant agnostic, he had become almost, if not altogether, a Christian; and in this spirit he had before his death revised his *Candid Examination of Theism* (1878). He was F.R.S. and LL.D. See his *Life and Letters* by his wife (1896), and his *Poems* (1896).

Romanesque Architecture, the debased style which succeeded Roman architecture from about the time of Constantine (350 A.D.) till the revival in the 11th century. Roman Architecture (q.v.), itself a transitional style, fades gradually into the Romanesque. When Constantine gave the Christians freedom of worship, he gave architecture a new start; and noble buildings resembling the Roman Basilica (q.v.) were built as churches all over the empire. These consisted of three- or five-aisled halls—the aisles separated by rows of columns. In Rome the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains existed, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the aisles are always single columns, generally with caps intended to be Corinthian, and wide arches; the aisles are wide, with open wooden roof; and there are remnants of entablatures, mouldings, &c., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the Minerva Medica (see ROMAN ARCHITECTURE), and were the most sacred places, where the burial-service was said, and the sacraments administered. Hence they afterwards became Baptisteries (q.v.), and were finally absorbed into the church (see RHENISH ARCHITECTURE), which then contained within itself everything connected with the Christian service.

In Rome there are still some thirty basilicas, and the Romanesque style may be said never to have died out there. As we recede from the centre we find its influence gradually weaken, and succumb to the Northern Gothic style. Thus, in Lombardy and Provence it was superseded by the Lombard (q.v.) and Romance styles in the 11th and 12th centuries; while in Byzantium and the East it gave way to the Byzantine style about the time of Justinian. Amongst the finest examples remaining are St Paul's (see BASILICA) and Sta Maria Maggiore at Rome, and at Ravenna St Apollinare; the interior decoration of which last (see fig.) is very beautiful. The mosaics of the apse, the painted walls, and the inlaid pavements of the Romanesque churches are amongst their finest features. In colour they always excel.



Romanesque Interior.

In Tuscany there is a late form of Romanesque, of which the cathedrals at Pisa and Lucca, San Miniato at Florence, and many churches in those cities are examples. They are intermediate specimens, built during the 11th century, when the cities became prosperous, and have a certain amount of Gothic feeling; but, although beautiful in coloured decoration, they have not the simple grandeur of the early basilicas; and, although more decorated externally than these, they have not the bold and purpose-like appearance of Gothic elevations.

See, besides the standard works on architecture, Okley, *Christian Architecture in Italy* (1860); Freeman, *Historical and Architectural Sketches* (1876); and *The Architecture of Provence and the Riviera* (1888), by the present writer, D. MacGibbon.

Romania, (1) the name given by the Venetians to the eastern part of the Morea, whence the capital was called Napoli di Romania (see NAUPLIA).—(2) Roumelia (q.v.) was sometimes called Romania.

Romanoff, HOUSE OF. See RUSSIA.

Romans, a town of France (dept. Drôme), stands on the right bank of the Isère, 12 miles by rail NE. of Valence. A bridge of the 9th century connects it with Péage on the left bank. Romans owes its origin to an abbey, founded in 837 by St Bernard, Bishop of Vienne. Silk fabrics, shoes, and hats are manufactured. Pop. (1872) 9893; (1891) 14,720.

Romans, THE EPISTLE TO THE, described by Luther as an absolutely perfect summary of the gospel (*absolutissima epitome evangelii*), was written by the apostle Paul (q.v.) in late winter or early spring of 58–59 A.D., at Corinth, while he was living in the house of Gains, and just before his setting out for Judea with the money that had been collected at his instance in Macedonia and Achaia for the poor of Jerusalem. Apart from

chap. xvi., which stands by itself, the epistle consists of two portions, marked off respectively by the doxology in xi. 36, and by the benediction in xv. 33. The first portion, which is mainly doctrinal, again falls into two sections—i.–viii. and ix.–xi.—in the former of which the Pauline doctrine of justification by faith is explained. The need for a justification through grace and received by faith alone, if there is to be effectual justification at all, is elaborately shown, and the doctrine is vindicated, historically and experimentally, against various conceivable objections, first from the religious, and then from the moral point of view. In the second division of the first portion the disparagement and neutralisation of the divinely bestowed privileges of Judaism apparently involved in the preaching of this doctrine without restriction among the Gentiles are considered. The second, or practical, part of the epistle deals with points of Christian morality and problems of Christian tolerance.

The epistle is addressed to the Christians in Rome. Who these were—whether they were Jews or whether they were Gentiles—and how they had come to be Christians, can only be conjectured. It is impossible to infer much about them or their circumstances from the epistle itself, for the church in Rome was not one with which the apostle, at the time of writing, was personally acquainted. Most probably he did not exactly know in what numbers or proportions the Jewish-Christian and Gentile-Christian elements existed within it; but he was warranted in assuming (as he seems to have done) that it contained both, and that the controversies with which he had become only too familiar elsewhere might break out at any moment in Rome also. The epistle gives no support to the tradition that the church in Rome had been founded personally by Peter; but doubtless it had relations with Jerusalem, and so may well be believed to have owed something to his indirect influence at least. The immediate object of the apostle Paul in writing to the Romans when he did is easily explained by the outward and inward circumstances through which, as we know, he was at the time passing. Having completed his preaching in the eastern part of the empire 'from Jerusalem to Illyricum' (xv. 19), he was purposing to extend his apostolic activity among the Gentiles westward as far as to Spain; and with a view to his success in the new field it was only natural that he should desire, so far as he could, to obviate possible misconceptions of his teaching, and to prepare for it a friendly and sympathetic reception in the metropolis of the world.

The Pauline authorship of the epistle as a whole has never been called in question; indeed it is one of the four canonical epistles which, along with the Apocalypse, were regarded by Baur as the only quite indubitable relics we possess of the apostolic age. Baur, it is true (following Marcion), rejected chaps. xv. and xvi., regarding them as additions of the 2d century. His arguments, which were based chiefly on what he conceived to be the too conciliatory character of certain expressions (such as xv. 8, 14, 15, 19), have not found general acceptance, and their force is disallowed even by some of his own followers (Hilgenfeld, Schenkel, Pfleiderer). At the same time there is some evidence, both internal and external, which indicates that these chapters are somewhat loosely attached to the main body of the epistle; in some ancient copies it closed with xiv. 23, immediately followed by xvi. 25–27 (see Revised Version, margin). A view widely accepted by scholars of various schools is that they consist of a postscript, or postscripts, or (the view of Lightfoot) that at some period after the original composition and transmission of the epistle the apostle, in order to adapt it for a wider circulation, re-issued it with omission of the last two chapters, as also of the word Rome at the beginning. Schultz in 1829, following up a hint of Semler (1769), suggested that xvi. 1–20 was really a fragment of a Pauline epistle to the Ephesians, and this suggestion, with various modifications, has been accepted by very many critics, among whom may be mentioned Reuss, Renan, and B. Weiss.

See the introductions of Reuss (6th ed. 1887), B. Weiss (2d ed. 1889; Eng. trans.), and Holtzmann (2d ed. 1886; this account is the fullest); and the commentaries by Philippi, Jowett, Godet, Gifford (in *Speaker's Commentary*), Moule (in *Cambridge Bible*), Liddon (1893), Lipsius, and Sanday and Headlam (1895).

Romansch (Ger. *Churwalsch*, from the town of Chur), a name applied to the Romance dialect, or rather agglomeration of cognate dialects, spoken from the Grisons to Friuli on the Adriatic. Ascoli includes all varieties under the common name of Ladino, although strictly that term applies to the dialect of the Engadine, as Rumonsch does to that of the upper Rhine valley. There are dictionaries by Conradi (Zur. 1820) and Carisch (Chur, 1821). See also J. Ulrich's *Rhätoromanische Chrestomathie* (1882–83) and *Rhätoromanische Texte* (1883–84).

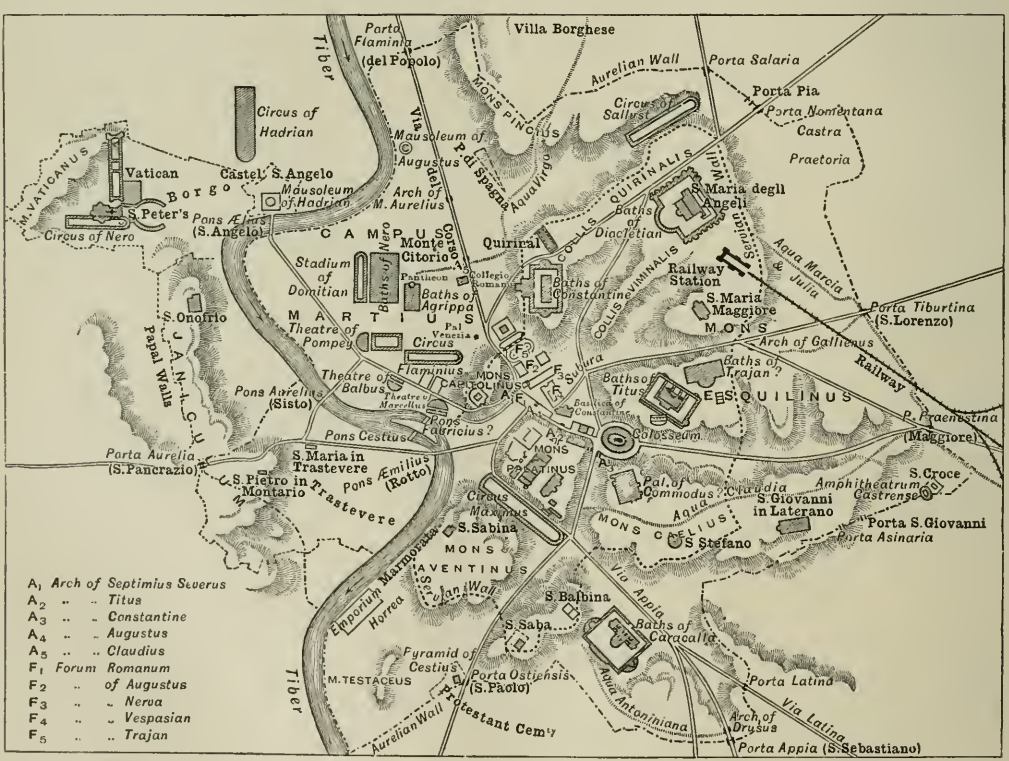
Romanticism (through the adjective *romantic*, from *romant* or *romaunt*, 'romance;' see ROMANCES), a movement in feeling and thought that has transformed the literature and art of most nations, has been defined by Mr Theodore Watts as 'the renascence of the spirit of wonder in poetry and art.' It was a revolt against pseudo-classicism; a return from the monotonous commonplace of everyday life to the quaint and unfamiliar world of old romance; a craving for the novel, original, and adventurous: an emphasising of the interesting, the picturesque, the 'romantic,' at the expense, if need be, of correctness and elegance, and the current canons of 'good taste.' Deep humour, strong pathos, profound pity are amongst its notes. Romanticism is not necessarily limited to any one period; there are romantic elements in Homer, Æschylus, Sophocles; the poetry of Dante is eminently romantic when contrasted with ancient classical poetry as a whole; but though what is romantic for one generation tends to become classic—and so tame, though not really insipid—for a later one, and though the romantic is almost inevitably one side of a truly artistic temperament, there are certain epochs that are specially romantic, and certain writers in those epochs more romantic than their fellows. The 18th century was notoriously classic in ideal, or pseudo-classic—conventional, pedantic, academic; and the revolt against spiritual ennui which followed is the romantic movement *par excellence*. The movement arose under various conditions in the several countries, had a somewhat varying character and course, and sometimes tended towards the merely crude and grotesque. In England, the fountainhead of the movement which culminated in the beginning of the 19th century, it may be traced from the Percy Ballads and Chatterton, from Cowper and Blake and Burns, to Scott and Byron, Wordsworth and Coleridge, Keats and Rossetti. In Germany there were tendencies in that direction in Lessing, in Schiller, in Goethe, as well as in the philosophy of Schelling, and the 'Sturm und Drang' period was largely romantic in its temper; but it was Novalis who was the prophet of 'romanticism,' and among the other representatives of the school were the Schlegels, Tieck, Kleist, Fouqué, and Hoffmann. In France beginnings are found in Rousseau, in Chateaubriand, and others; but the great chief of French romanticism is Victor Hugo. Other French romantics are Lamartine, Dumas, Gautier, George Sand, Flaubert,

Mürger. The romantic movement in the three countries is discussed in the articles on the literature of each (ENGLISH LITERATURE, Vol. IV. p. 375; GERMANY, Vol. V. p. 188; FRANCE, Vol. IV. p. 789). The other countries were more or less moved by the same spirit; see also the articles on the literatures of the principal countries. The influence of Percy's *Reliques* is traced in the article BALLADS. In Germany romanticism included with the love of the mediæval an affection for the oriental; in religion it led some of its notable representatives to Catholic ideals and into the Catholic Church; and in politics it was associated with reactionary conservatism. The aims of the romantics in painting are defined at PAINTING, Vol. VII. p. 700; see also PRE-RAPHAELITISM. In music Weber has been called the 'creator of romantic opera;' but see OPERA, Vol. VII. p. 608. Berlioz is regarded as the type of French romanticism in music.

See the article IDEALISM, REALISM; Pater in *Macmillan's Magazine*, vol. xxxv.; for Germany, the works by Julian Schmidt (1848), Haym (1871), Brandes (1873); for France, Stendhal, *Racine et Shakespeare* (1823); Gautier, *Histoire du Romantisme* (4th ed. 1884); and many essays by Sainte-Beuve and Schérer.

Romany. See GYPSIES.

Rome, the capital of the modern kingdom of Italy, stands on the Tiber, about 15 miles from its mouth. Roman legend ascribed the foundation of the city to Romulus, at a date corresponding to 753 B.C. But recent explorations have proved that the site was inhabited in the neolithic and early bronze period. The existence of a town with a considerable population at a time long before the date ascribed by tradition to the foundation of the city has been established by the discovery in 1874 of a cemetery on the Esquiline, near the railway station, which contained pottery of the type usually assigned to the 9th or 10th century B.C. In the time of the kings (753–510 B.C.) the city occupied seven hills, whose summits rise from 80 to 120 feet above the river and the intervening valleys. These hills are believed to have been formed by subaerial erosion of beds of soft tufa previously erupted by submarine volcanoes. Of these seven hills five—the Palatine, the Capitoline, the Aventine, the Cælian, and the Esquiline—being more or less isolated, were termed *Montes;* and two, the Quirinal and Viminal, being mere spurs jutting out from the tableland to the east, were called *Colles.* The Esquiline, however, is properly rather a *Collis* than a *Mons,* being connected with the tableland by a narrow neck. The Palatine and the Capitoline, being the most defensible sites, were doubtless the first to be occupied, and this accords with the Roman legend, which makes the Palatine the site of the primitive city founded by Romulus, the Capitoline being occupied by a rival Sabine



Map of Ancient Rome:

The positions of a few of the more important modern places of interest are also indicated; the ancient names being given in *Italic* and the modern in Roman letters.

settlement which, under Tatius the Sabine king, soon extended to the Quirinal, a contiguous spur of the tableland, separated only by a narrow valley from the Capitoline. We are also told that the Aventine, which after the Palatine and the Capitoline was plainly the most desirable site, was occupied by a colony of Latins in the time of Ancus Martius, the fourth king. Under Servius Tullius, the sixth king, the Esquiline, together with the Viminal, which is a mere spur of the Esquiline, is said to have been added to the city. These legends conform to the probabilities of the case.

The settlement on the Palatine attributed to Romulus was fortified at a very early period,

possibly about the date assigned to the foundation of the city. Remains of this earliest wall have been discovered in the course of recent excavations. The steep slopes were scarped, and a retaining wall, consisting of large stones fitted together without mortar, was built up from the base of the slope, rendering the hill almost impregnable. The Palatine was thus made into a sort of artificial platform, rising some 100 feet above the surrounding valleys, and was called the 'square city' (*Roma quadrata*). In the time of the later or Etruscan kings at least five of the settlements on the seven hills had been surrounded by separate defences. These fortified hills, with the marshy hollows between them, were then enclosed by a huge rampart or *agger* of earth, faced with an exterior wall of unmortared masonry, which is still in one place 50 feet in height, with an inner retaining wall of similar construction. Outside the rampart was an enormous fosse, which from recent excavations appears to have been in some places 30 feet in depth and 100 feet in breadth, from which the materials for the agger were obtained. In the construction of this rampart the older walls, which ran along the crests of the Palatine and Capitoline hills, were utilised, as is indicated by the fact that the agger can only be traced where it crossed the intervening valleys, or where it protected the spurs where they joined the tableland. The agger, begun probably by Tarquinius Priscus, has received the name of Servius Tullius, by whom probably the portion which included the Quirinal and the Esquiline was completed. A considerable fragment of this part of the agger may be conveniently examined in the goods yard of the railway station. An excellent cross section is exposed on the northern crest of the Quirinal in the Via di S. Nicola di Tolentino, and a further extension may be traced in the gardens of the Barberini and Colonna palaces. A very perfect fragment may also be seen in the valley below the southern slope of the Aventine.

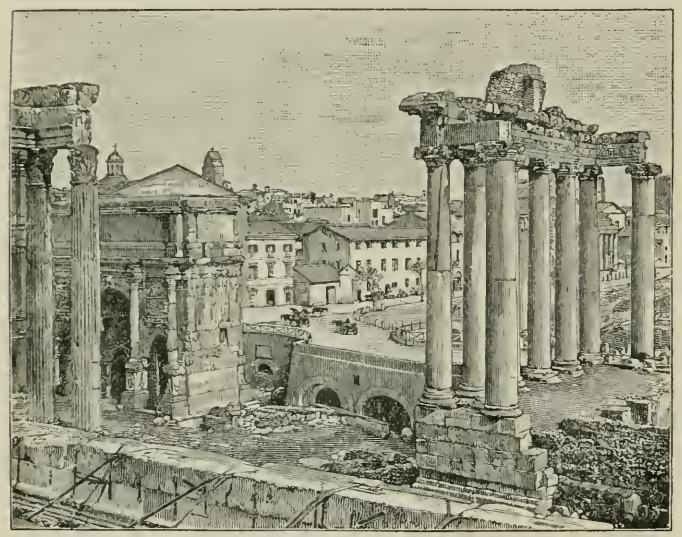
For 800 years, till the reign of the Emperor Aurelian, the Servian agger formed the only defence of the city. The wall which bears the name of Aurelian is to a great extent identical with the present walls. It enclosed the suburbs which had grown up beyond the Cælian, the Esquiline, and the Quirinal, and included two additional hills, the Pincian, and part of the Janiculum, as well as the low-lying ground near the Tiber called the Campus Martius, which now forms the busiest and most densely populated part of the modern city. The Aurelian Wall, as it is called, was begun by Aurelian in 271 A.D., and completed by the Emperor Probus in 280. It was restored and partially rebuilt by Honorius, and repaired by Belisarius. It is 12 miles in circuit. The Leonine Wall, enclosing the Vatican Hill and the remainder of the Janiculum, was built by Leo IV. in 848. In 1527 some additional space on the Vatican was enclosed, and bastions to strengthen the weak parts of the old wall were added. At the present time populous suburbs have arisen to the east and north beyond the walls, while to the south extensive spaces within the wall are uninhabited. In 1888 no less than 1465 acres, chiefly on the Cælian and the Aventine, were occupied by vineyards, fields, and gardens, while public gardens and squares occupied 106 acres.

To the period of the kings belongs the *Cloaca Maxima*, a huge arched sewer of Etruscan masonry, which drained the marshy hollow between the Capitoline, Palatine, and Esquiline hills. A portion of this valley became the Forum Romanum, at once the market and the place of political meeting for the Roman, Sabine, and Latin tribes, who occupied the surrounding hills. The *Cloaca Maxima* (q.v.), though the oldest and best known of the sewers, is rivalled in magnitude by two other ancient sewers which enter the Tiber nearly at the same point. The so-called Mamertine prison at the foot of the Capitol, now consecrated as the subterranean church of S. Pietro in Carcere, was a deep vaulted well from which, and from the Tiber, the water-supply must have been obtained during the regal period. When Rome was supplied with water by aqueducts from the Alban hills and the Apennines this well, perhaps the most ancient structure in Rome, was converted into a dungeon, in which state-prisoners, among them Jugurtha and the Catiline conspirators, were confined. That St Peter, by whose name the well is known, was ever confined here is a mere legend, of no authority or probability.

In the great aqueducts we have the most notable remains of the Republican period. The oldest was the *Aqua Appia*, constructed by Appius Claudius Cæcus in 312 B.C., which brought water from springs upwards of seven miles distant from the city. The *Anio Vetus*, 43 miles long, was commenced in 273 B.C., and brought water from the river Anio. The *Aqua Marcia*, 62 miles in length, was constructed in 144 B.C., and brought water from the Alban hills at a level sufficiently high to supply the Capitol. The *Aqua Julia*, the *Aqua Claudia*, and the *Anio Novus*, constructions even more gigantic, date from the imperial age. Altogether there were fourteen of these aqueducts, with an aggregate length of 351 miles. These vast structures, striding on their huge arches across the Campagna, and still bringing copious supplies of water from the Apennines and the Alban hills, are among the most striking features of modern Rome. A portion of one of these aqueducts was utilised in the construction of the Aurelian Wall, the arches being simply built up with masonry. The remains of the enormous arches by which the water of the *Aqua Claudia* was brought across the deep valley between the Cælian and the Palatine also exhibit the vast scale of these erections (see AQUEDUCT).

In the time of the Republic the centre of the public life of the city was the *Forum Romanum*, an oblong space, containing about 2½ acres, surrounded by shops (*tabernæ*). It was traversed by the *Via Sacra*, a winding road, along which triumphal processions passed to the Capitol. The great blocks of lava with which this road was paved still, for the most part, remain *in situ*. The Temple of Vesta and the House of the Vestal Virgins stood on one side of the Forum beneath the Palatine, and on the other side was the Regia, or House of the Pontifex Maximus. Close by were the *rostra*, the beaks of captured Carthaginian ships, between which was the platform from which orators harangued the people. Farther to the north-east was the Senate House, whose walls are preserved in those of the church of S. Adriano; the neighbouring church of SS. Luca e Martina being constructed out of the offices of the Senate House. Beyond the Senate House stood the Treasury and the Tabularium. In course of time the open space of the Forum became surrounded and occupied with stately public edifices, of which the most conspicuous remains are the eight columns of the Temple of Saturn, built in 491 B.C., the Colonnade of the Twelve Great Gods (*deorum consentium*), the Temples of Concord, of Castor and Pollux, built in 496 B.C., of Vesta, of Julius Cæsar, of Vespasian, and of Faustina. We see also the foundations of the Triumphal Arch of Augustus, the vast ruins of the Basilica Julia, the base of the column of Phocas, and the milestone from which all Roman roads were measured. To the north of the Forum stands the Triumphal Arch of Septimius Severus,

to the south the Arch of Titus (see ARCH). So much of the open space of the Forum became occupied by great public monuments and edifices that in the time of the emperors additional fora were required. These were erected on the eastern side of the Forum Romanum. Of the Forum Julium only three arches of the outer wall remain. Of the Forum of Augustus a portion of the enclosing wall, a massive archway, and three columns of the Temple of Mars Ultor, which stood within the Forum, now cleared of rubbish, are among the most imposing and accessible remains of the architecture of the early empire. Of the Forum of Nerva two columns may be seen in the Via della Croce Bianca. Of the Forum Pacis, built by Vespasian, nothing remains except one massive fragment of a wall. The most magnificent of the imperial fora was the Forum of Trajan, which was reckoned one of the wonders of the world. Within its walls stood the Basilica Ulpia, which has been partly excavated, so as to expose the bases of many of the columns.



The Forum Romanum at the present time.

Beyond it stands the great Column of Trajan, 124 feet in height, with spiral bas-reliefs representing scenes from Trajan's campaigns against the Dacians, forming the most instructive historical monument in Rome. We are shown the march of a Roman army, the construction of bridges, assaults on forts, and all the varied incidents of a campaign, constituting a pictorial record containing some 2500 figures of men and horses, which may compare with the Bayeux tapestry, or the pictorial narratives of Egyptian campaigns which are represented on the walls of Theban temples. In the same style, but of inferior art, is the Column of Marcus Aurelius in the Piazza Colonna on the Corso, usually called the Antonine Column. It bears reliefs representing scenes in the wars with the Marcomanni.

On the western side of the Forum Romanum rises the Palatine Hill, its summit covered with the substructures of the Palaces of the Emperors, the Houses of Augustus, of Tiberius, of Livia, of Caligula, of Domitian, and of Hadrian. Most magnificent of all is the Septizonium or Palace of Septimius Severus, rising in seven stages of massive masonry, which form a southern extension of the Palatine Hill. Besides these imperial palaces, the Palatine included a magnificent Stadium the most perfect in existence, imperial reception-halls, several temples, with gardens, baths, barracks for soldiers, and a basilica or hall of justice, in which St Paul must have pleaded before the emperor. The Golden House of Nero, built on the opposite side of the Forum, and occupying the greater portion of the Oppian Hill, was demolished to make room for the Colosseum and the Baths of Titus, so that practically nothing is left save some substructures, the cisterns known as the Sette Sale, and the base of the colossal statue of Nero, which stood in front of the Golden House.

Of the numerous temples in Rome, of which there are said to have been three hundred, the names, and in many cases the sites, of 153 are known. The foundations of the great Temple of Jupiter Capitolinus may be traced in the gardens of the Caffarelli Palace, now the German embassy. Of the temples which remain the preservation is due in several cases to their having been converted into churches. The columns in front of the church of S. Lorenzo in Miranda, which faces the Forum, formed part of the Temple of Antoninus and Faustina. Ten columns of the Temple of Ceres are built into the walls of S. Maria in Cosmedin. S. Maria del Sole is a round temple formerly called the Temple of Vesta, but now believed to be the Temple of Hercules Victor. Another temple, supposed to be the Temple of Fortuna Virilis, is now the church of S. Maria Egiziaca. The church of SS. Cosmo e Damiano is the Temple of Sacra Urbs, erected by the Emperor Maxentius. The *cella* of the Temple of Venus and Rome, built by Hadrian, is preserved in the church of S. Francesca Romana. It is believed that the church of SS. Sergio e Bacco was the Temple of Concord, that the church of S. Stefano Rotondo was the Temple of Mater Matuta, and that of S. Nicola was the Temple of Piety; while Santa Maria sopra Minerva stands on the ruins of a Temple of Minerva, S. Maria Liberatrice probably occupies the site of a Temple of Vesta, and the round church of S. Teodoro was a temple of unknown attribution. In 27 B.C. Agrippa built a vast dome in front of the Thermæ which he erected in the Campus Martius. It is called by Pliny and other writers the Pantheon, and may have served as a sort of entrance-hall to the Thermæ. In 608 it was consecrated as the church of S. Maria ad Martyres, and now goes by the name of S. Maria Rotonda. Of all the buildings of ancient Rome none is more perfectly preserved. The diameter of the dome, which is lighted only by a central aperture in the roof, is larger than the dome of St Peter's; the walls, 19 feet in thickness, have deep niches which were filled with statues of deities; and the floor is of Phrygian and Numidian marbles, with porphyry and granite slabs.

The Thermæ of Agrippa, of which the Pantheon is the only portion that remains, were the earliest of the eleven great public baths which formed so characteristic a feature of imperial Rome. The Thermæ of Trajan, and the adjacent Thermæ of Titus, built on the site of the Golden House of Nero, occupied almost the whole of the Oppian Hill; but of these baths little is left save the foundations. On the slope of the Quirinal stood the Thermæ of Constantine. In the Piazza del

Quirinale stand two colossal horses from the thermæ which occupied the site. In the formation of the steps which lead down from the piazza, and of the Via Nazionale, substructures belonging to these thermæ were discovered, and portions of their massive walls may be seen in the gardens of the Colonna and Rospigliosi palaces. At the other end of Rome, on the low ground south of the Cælian, are the ruins of the Thermæ Antoninianæ, usually called the Baths of Caracalla, by whom they were begun in 212 A.D., and completed by Alexander Severus. They were built to accommodate 1600 bathers, and, after serving for centuries as a quarry, are still the vastest, and in their desolation perhaps the most impressive, of all the ruins in Rome. The lofty walls are still standing, and, as the halls have been cleared of rubbish, the arrangements of Roman thermæ (see BATHS) can here best be studied. We see the Calidarium, the Tepidarium, and a Frigidarium, with an Exedra and a Stadium or racecourse. The outer wall encloses a space of nearly 27 acres, of which the baths themselves occupy more than 6 acres. Even more magnificent were the Thermæ of Diocletian, on the summit of the Quirinal, designed to accommodate 3600 bathers. The semicircular curve which forms such a conspicuous feature in the Piazza delle Terme was the exedra of these baths. One of the smaller circular halls forms the church of S. Bernardo, while a portion of one of the great vaulted central halls, with its columns of Egyptian granite, serving probably as the Tepidarium, was converted by Michael Angelo into the magnificent church of S. Maria degli Angeli. Another hall is used as a prison, another as a fencing-school, others now serve as barracks, stables, coach-houses, and warehouses for timber, while the cloisters of a Carthusian convent built out of the ruins are now converted into a museum.

A large marshy plain, which now forms the most densely populated part of Rome, lay outside the Servian Walls, extending from the foot of the Capitoline and Quirinal hills to the Tiber. This, being used for military exercises, was called the Campus Martius. Towards the close of the republican era this suburban plain began to be utilised for the erection of places of public recreation, such as baths, theatres, and racecourses. These were connected by the Porticoes, a network of colonnades forming covered walks, serving as a protection alike from the sunshine and the rain, along which the citizens could stroll to the various places of recreation and amusement. The Campus Martius was traversed by the Flaminian Way, approximately represented by the modern street called the Corso, which was bordered on either side by the stately tombs of Roman nobles, and spanned by the triumphal arch of Claudius and by that of Marcus Aurelius, demolished in 1662. On these fields were built the Baths of Agrippa and the Baths of Nero. Here was erected the Theatre of Balbus and the vast Theatre of Pompey, said to have contained seats for 40,000 spectators. Some of its substructures may be seen behind the church of S. Andrea della Valle. Somewhat nearer to the Capitol was the Theatre of Marcellus, of which a considerable portion still stands, forming one of the most characteristic examples of Roman architecture of the best period. This theatre was begun by Julius Cæsar, and finished in the year 11 B.C. by Augustus, who named it after his nephew Marcellus, the son of Octavia. In the 11th century, like the Colosseum and the Mausoleum of Hadrian, it was turned into a fortress by the turbulent Roman nobles of the Orsini family. The interior is now occupied by the Palazzo Orsini-Savelli, while the outer arches are used as rag-shops and smithies.

In the same characteristic Roman style as the Theatre of Marcellus, but of a more debased type, is the great Flavian Amphitheatre, built for gladiatorial exhibitions and for the combats of wild beasts, which goes by the name of the Colosseum. Commenced by Vespasian, it was dedicated by Titus 80 A.D., and finished by Domitian. It is built in the form of an ellipse, the longer diameter measuring 613 feet and the shorter 510 feet. It rises to a height of 160 feet, covering five acres of ground. In the middle ages it was used as a fortress and afterwards as a quarry; but, though so large a portion has been demolished, it constitutes perhaps the most imposing monument of Roman magnificence which is left (see AMPHITHEATRE). The earlier amphitheatres were mostly of wood, and have perished. The Piazza di Monte Citorio on the Corso is believed to occupy the site of the Amphitheatre of Statilius Taurus, erected in 31 B.C., the foundations having been found 88 feet below the present surface of the street. At the side of the church of S. Croce in Gerusalemme are considerable remains of the Amphitheatrum Castrense, which was utilised in the construction of the Aurelian Wall, from which it projects, forming a sort of semicircular bastion. Below was the Circus of Elagabalus, from which came the Egyptian obelisk now in the Pincian Gardens.

The oldest circus was the Circus Maximus, in the valley between the Palatine and the Aventine. It is supposed to date from the regal period, but was enlarged by Julius Cæsar. It was about three furlongs in length and one in breadth, nearly the size and shape of Eaton Square, and is said to have been capable of seating 250,000 spectators. The site is now occupied by the Jewish cemetery and the gas-works. The arrangements of a Roman circus can best be studied in the well-preserved circus on the Appian Way, near the tomb of Cæcilia Metella, built in 311 A.D., which usually bears the name of the Emperor Maxentius, but is more correctly assigned to his son Romulus. It is 350 yards long and 86 broad. The metæ, the spina, the carceres, and the seats for the emperor and the spectators may still be traced. An Egyptian obelisk from this circus now adorns the Piazza Navona (see CIRCUS).

Of the Circus of Flaminius, built in 220 B.C. on the Campus Martius immediately below the northern slope of the Capitoline Hill, no vestiges remain. The same is the case with the Circus of Nero on the Vatican, which occupied the hollow between S. Peter's Church and the Sacristy through which the visitor now drives to the Vatican Museum. While the circus was designed for chariot-races, the stadium was used for foot-races. Of these there were several, but the Imperial Stadium on the Palatine, between the house of Augustus and the buildings of Septimius Severus is the only one which remains in a tolerable state of preservation. The Stadium of Domitian on the Campus Martius is believed to be represented by the present Piazza Navona, recently renamed the Circo Agonale. Both of these stadia are about the size and shape of St George's Square, Pimlico, or the site of the Houses of Parliament.

The roads leading out of Rome beyond the Servian Walls were bordered by tombs, many of which, on the erection of the Aurelian Wall, were included within the city. On the Appian Way (q.v.) are the tombs of the Scipios, the inscriptions on which, forming the earliest contemporary records of Roman history, are among the treasures of the Vatican. Farther on four ancient columbaria have been excavated. Outside the Aurelian Wall is the Tomb of Cæcilia Metella (see ROMAN ARCHITECTURE), wife of the triumvir Crassus, which in the 13th century was converted into a fortress

by the Gaetani family. It is a cylindrical block of masonry, 65 feet in diameter, resembling the keep of a feudal castle. Another remarkable tomb is the Pyramid of Caius Cestius in the Via Ostiensis. The most magnificent of Roman tombs was the Mausoleum of Hadrian, now the castle of S. Angelo. It was a cylindrical tower of masonry, 240 feet in diameter and 165 feet in height, surmounted by a colossal statue of the emperor. When the Goths besieged Rome the tomb was converted into a fortress by Belisarius. It afterwards became the castle of the popes, and citadel of Rome, and in 1527 was defended against the French by Benvenuto Cellini. Of similar construction and hardly inferior in magnitude was the Mausoleum of Augustus, which stood behind the great church of S. Carlo al Corso. In the middle ages it formed the castle of the Colonna family, and is now occupied as the Teatro Corea. Two obelisks of Egyptian granite faced the entrance, one of which now stands in the Piazza of S. Maria Maggiore, and the other fronts the Palace of the Quirinal. In all there are eleven Egyptian obelisks which ornament the gardens and piazzas of Rome. Two stand near the Pantheon close to the sites of the Temples of Isis and Serapis, before which they were originally erected. Another, now in the Piazza del Popolo, was brought from Heliopolis by Augustus, and placed in the Circus Maximus. That in the Piazza di Monte Citorio was also brought to Rome by Augustus. That in the Piazza of S. John Lateran, 104 feet in height, is the largest in existence. It was erected at Thebes by Thothmes III., and removed by Constantine to the Circus Maximus. The obelisk in the Piazza di S. Pietro was brought from Heliopolis by Caligula, and placed in the Circus of Nero, near its present site. On the Pincian is an obelisk of Hadrian; and there is another in the gardens of the Villa Mattei.

Of the triumphal arches those of Augustus, Tiberius, Claudius, Marcus Aurelius, and Trajan have disappeared. The Arch of Septimius Severus, which spanned the Sacred Way just as it began to climb the Capitol, remains in a fair state of preservation. At the other end of the Forum, also spanning the Sacred Way, is the Arch of Titus, with the well-known reliefs representing the spoils from the Temple at Jerusalem (see ARCH). A little farther south, where the Sacred Way joins the Appian Road, stands the Arch of Constantine, fronting the Colosseum and the three huge arches of the Constantine Basilica. The so-called Arch of Drusus crosses the Appian Way where it passes through the Aurelian Wall. The Arch of Dolabella, built in 10 A.D., is almost hidden in the brickwork of the Aqueduct of Nero, called the Aqua Claudia; and the Arch of Gallienus on the Esquiline, erected in 262 A.D., is in the degraded style of the time (see ARCHES).

Of the twelve bridges over the Tiber three are survivals of the eight or nine ancient bridges. The oldest is the Pons Fabricius, built in 62 B.C. by L. Fabricius, leading from the city to the island in the Tiber. The Pons Cestius, believed to have been built by the Emperor Gratian, leads from the island to the right bank of the river. The Pons Ælius, now called the Ponte S. Angelo, was built by Hadrian in 135 A.D. in front of his Mausoleum, and now serves as the approach to St Peter's and the Vatican. The Ponte Rotto, or 'broken bridge,' was part of the Pons Æmilius, built in 181 B.C. Two picturesque arches remained till the recent 'improvements.' It is now replaced by a suspension bridge. The Ponte Sisto was built by Pope Sixtus IV. to replace the Pons Aurelius.

Modern Rome.—It is impossible within moderate limits to give an adequate account of Rome, which contains more objects of interest than any other city in the world. A bare enumeration of facts must therefore suffice. The Observatory in the Collegio Romano is situated in 41° 53′ 52″ N. lat. and 12° 28′ 40″ E. long. The population was 226,022 in 1870; 272,560 in 1876; 300,467 in 1881; 401,044 in 1888; and 512,423 in 1899. The walls, which enclose 3880 acres, are 14 miles in circuit, with fifteen gates, two of which are closed. Since 1870 more than 3000 new houses have been built, 82 miles of new streets have been formed, and 5½ millions sterling have been spent by the municipality on the improvement of the city. During the progress of these improvements 1824 inscriptions, 2360 lamps, 191 marble statues, 266 busts, and 36,679 coins have been found. There are twelve bridges, five of which are old, and the rest comparatively new. The chief gates are the Porta del Popolo and the Porta Pia on the north, the Porta S. Lorenzo and the Porta Maggiore on the east, the Porta S. Sebastiano and the Porta S. Paolo on the south. Old Rome stands on the left bank of the Tiber; on the right bank, occupying the Vatican and Janiculum hills and the low ground between these hills and the river, are St Peter's, the Vatican Palace, the Borgo, and the Trastevere. The business part of the city occupies the plain on the left bank between the hills and the river, traversed by the Corso, the principal thoroughfare of Rome, about a mile in length, leading from the Porta del Popolo to the foot of the Capitoline Hill. From the Piazza del Popolo two great streets diverge on either side of the Corso, the Via di Ripetta to the right, skirting the Tiber, and to the left the Via del Babuino, leading to the Piazza di Spagna, whence the Scala di Spagna, the resort of artists' models, ascends to the Pincian Gardens, on the site of the gardens of Lucullus, which command a splendid view of the city, and form the fashionable drive and promenade of the Romans.

Before Rome became in 1870 the capital of Italy, the greater part of the Pincian, Quirinal, and Esquiline hills was occupied by villas of the Roman nobles, with extensive gardens planted with ilexes and vines. With two exceptions these have been destroyed, and their sites have been covered with modern houses, and too often by blocks of ugly barrack-like buildings, many stories in height, let out in tenements. The dirty but picturesque mediæval city is assuming the aspect of a modern capital, broad, straight thoroughfares having been driven through quarters formerly occupied by narrow streets and mean, crowded houses. Of the new streets the most important are the Via Venti Settembre, from the Porta Pia to the Quirinal, and the Via Cavour and the Via Nazionale, which lead from the railway station, the first to the Forum, and the second to the lower end of the Corso. This is continued to the west by the Corso Vittorio Emmanuele as far as the Borgo, crossing the Tiber by a new bridge. The older foreign quarter lay at the foot of the Pincian, around the Piazza di Spagna, but the healthier sites on the slopes and summits of the Quirinal and Esquiline are now more frequented.

Of the palaces the largest are the Vatican, the residence of the pope, and the Quirinal, now the residence of the king, but formerly a papal palace, in which the conclaves were held for the election of the popes. Many of the palaces of the Roman nobles contain collections of pictures and statuary. Chief among them are the Palazzo Borghese, containing, next to the Vatican, the best collection of pictures in Rome, the Palazzi Colonna, Doria, Barberini, Rospigliosi, Chigi, Torlonia, Farnese, Corsini, and di Venezia, now the Austrian embassy. Among the notable villas are the Villa Borghese, standing in a great park below the

Pincian; the Villa Ludovisi, on the Pincian; the Villa Albani, outside the Porta Salara; and the Villa Medici, on the Pincian, now the Académie Française, with a splendid collection of casts. The gardens of the Villa Mattei, on the Cælian, command one of the best views in Rome. The picturesque arches of the Aqua Claudia traverse the gardens of the Villa Wolkonsky.

Besides the private collections Rome abounds in libraries and museums. The Collegio Romano, formerly a great Jesuit college, is now occupied by a public library of modern books called the Biblioteca Vittorio Emmanuele, by the Kircherian Museum of Antiquities, and by a well-arranged prehistoric and ethnological museum. The Palazzo dei Conservatori, on the Capitol, contains many of the best ancient statues. In the cloisters of the Carthusian convent in the Thermæ of Diocletian are stored the antiquities brought to light during the recent excavations. Others from the excavations at Falerii are collected in the Villa di Papa Giulio, outside the Porta del Popolo. The Villa Medici contains a good collection of casts from ancient statues. The Lateran Palace contains an unrivalled collection of inscriptions and sculptures from the Catacombs, and a few good statues and mosaics. The Lateran is exterritorial, and the Museum is the property of the popes.

The chief papal collections are contained in the galleries attached to the Vatican, probably the largest palace in the world. In addition to the private gardens and apartments of the pope, the Vatican Palace comprises immense reception-halls with a series of chapels, libraries, picture-galleries, and vast museums of sculptures, antiquities, and inscriptions, which can here be only enumerated in the briefest manner. The Sistine Chapel, built in 1473 by Sixtus IV., is covered with magnificent frescoes by Michael Angelo and the great Florentine masters. The Capella Nicolina, built by Nicolas V., and the Pauline Chapel, built by Paul III. in 1590, are also painted in fresco; the first by Fra Angelico, and the second by Michael Angelo. Raphael's Stanze and Loggie are halls and solars covered with inimitable frescoes executed by Raphael, Perugino, Giulio Romano, and other masters of their school. Beyond the Loggie is the picture-gallery, containing the best collection of oil-paintings in Rome. The world-famous Vatican Library, with its priceless MSS., its collections of early printed books, of Christian antiquities, ancient maps and jewellery, is contained in two immense halls. The vast sculpture-galleries, with their unrivalled collections, comprise the Museo Chiaramonte, the Braccio Nuovo, and the Museo Pio-Clemente, which includes the Cortile di Belvedere, containing the Laocoon, the Apollo Belvedere, and the so-called Antinous, perhaps the most beautiful statue in the world. The inscriptions are contained in the Galleria Lapidaria, the Etruscan antiquities in the Museo Gregoriano, below which is the Egyptian Museum.

The churches, said to be upwards of 300 in number, are among the most conspicuous features of modern Rome. Many of them are rather what we should call mortuary or memorial churches, opened only once a year on the festival of the saint to whom they are dedicated. There are also the churches of the great religious orders, twenty-eight parish churches, and the titular churches of the cardinals. The most noteworthy are the five patriarchal churches, the seven pilgrimage churches, and the eight basilican churches. Others are interesting either from their early date, their historical associations, from the archæological or artistic treasures they contain, or from the fragments of earlier structures which they enclose.

First in rank are the five patriarchal churches. S. Giovanni in Laterano (see LATERAN), between the Cælian and the Esquiline hills, ranks as the first church in Christendom. It dates from the time of Constantine. It was, till the rebuilding of S. Peter's, the metropolitan cathedral of Rome and of the western patriarchate. It retains its 5th-century baptistery and the 13th-century cloisters, the most beautiful in Rome. The Santa Scala, brought by the Empress Helena from Jerusalem, has for centuries been the chief object of veneration among pilgrims. The church itself was burned down and rebuilt in the 14th century, and has been repeatedly altered and modernised. The adjoining palace of the popes is now converted into a museum, chiefly of Christian antiquities. The Basilica of St Peter (S. Pietro in Vaticano), the largest church in the world, was rebuilt in the 16th century from the designs of Bramante, Michael Angelo, and Bernini. It was begun in 1506, and consecrated in 1626. It is in the form of a Latin cross, with a vast central dome. The interior length is 615 feet, the height of the nave 150 feet, and of the cross which surmounts the dome 435 feet. S. Paolo fuori le Mura, a vast 4th-century church, was before the fire of 1823 the most interesting church in Rome. It has been rebuilt in a style of great magnificence. S. Lorenzo fuori le Mura, occupying the site of a church founded by Constantine, was rebuilt in 578, and remodelled in the 13th century, but still retains the ancient marble and granite columns. The Basilica Liberiana, on the Esquiline, is commonly called S. Maria Maggiore, being the largest of the eighty churches in Rome dedicated to the Virgin Mary. It is one of the oldest churches in Rome, the nave dating from the 5th century.

These five patriarchal churches, together with S. Croce and S. Sebastiano, constitute the seven ancient pilgrimage churches. The five patriarchal churches, together with S. Agnese, S. Croce, and S. Clemente, are the eight basilican churches. S. Agnese fuori le Mura was founded by Constantine, and rebuilt in the 7th century. It contains many early Christian inscriptions. S. Croce is a 5th-century basilica, and is said to have been erected by the Empress Helena. S. Clemente is the most archaic church in Rome. The upper church dates from the 12th century; the lower, which is entirely underground, from the 4th; and below it there are far older substructions dating from the imperial and republican periods. In addition to the eight basilican churches, others already mentioned conserve the remains of earlier buildings. S. Maria in Cosmedin, one of the most interesting churches in Rome, preserves ten columns of the Temple of Ceres, out of which it was constructed, and twenty ancient columns taken from other buildings. It has also a beautiful tesselated pavement of ancient marbles. S. Maria degli Angeli and S. Bernardo were constructed out of the Thermæ of Diocletian, and S. Pietro in Carcere out of the Mamertine prison. S. Giorgio in Velabro, a 4th-century church, was rebuilt in the 7th century, but preserves sixteen of the ancient columns. S. Costanza, outside the Porta Pia, was erected by Constantine, and contains interesting 4th-century mosaics. The granite columns in S. Maria in Araceli, on the Capitol, have been taken from some earlier building. On the Cælian we have SS. Giovanni e Paolo, founded in the 5th century and rebuilt in the 12th; S. Stefano Rotondo, a 5th-century church, containing the episcopal throne of Gregory the Great; and the interesting church of S. Gregorio, built in 575 on the site of his father's house. On the Aventine are S. Balbina and S. Sabina, both of the 5th century. On the Esquiline are S. Pudenziana, a very ancient

church, with 4th-century mosaics, probably constructed out of a private house; S. Prassede, a 9th-century church, with ancient granite columns and 9th-century mosaics; and S. Pietro in Vincoli, a 5th-century basilica, with twenty ancient Doric columns, and containing Michael Angelo's statue of Moses, and the supposed chains of St Peter, which were undoubtedly presented by Pope Leo I. to the Empress Eudoxia in 442. On the right bank of the Tiber are S. Crisogono, a 12th-century church, with ancient porphyry columns and a fine mosaic pavement; S. Maria in Trastevere, a 5th-century church, rebuilt in the 12th century, with twenty-two ancient columns, some fine mosaics, a splendid marble pavement, with numerous interesting early inscriptions in the portico; S. Cecilia has 9th-century mosaics; while the Piazza of S. Pietro in Montorio commands the finest view of Rome. S. Maria sopra Minerva, near the Pantheon, the chief Dominican church, is the only Gothic church in Rome. Among the vast modern churches are the Gesù, the gorgeous church of the Jesuits, containing the tomb of S. Ignatius Loyola; S. Carlo al Corso, now the fashionable church of Rome; S. Andrea della Valle; SS. Apostoli; S. Maria Vallicella, commonly called Chiesa Nuova; and the Cappuccini, with its catacombs and Guido's picture of St Michael.

One of the greatest improvements which has been effected is the embankment of the Tiber, and the straightening and deepening of its channel. This has put a stop to the disastrous floods by which the lower parts of the city were formerly inundated. But the municipality being now practically bankrupt, the grandiose schemes for the further reconstruction of the city, and for making Rome a port by the canalisation of the Tiber, are for the present suspended.

In addition to the objects of interest which have been briefly enumerated are the vast Catacombs (q.v.) extending underground for many miles, the Ghetto, the Sapienza, the Propaganda, and the Protestant cemetery with the tombs of Keats and Shelley. The best panoramic views of Rome are from the Pincio, the Villa Mattei, S. Pietro in Montorio, the Janiculum, the garden of the Priorato di Malta, and from outside the Porta S. Giovanni. Rome is now a fairly healthy city, except in the late summer months; the water-supply is unrivalled both for quality and quantity, and the streets are well cleansed. No city excels Rome in its public fountains.

There are practically no manufactures in Rome. Hats, gloves, neckties, false pearls, and trinkets are made, and there are cabinet-makers, and a few foundries on a small scale, but compared with other great cities the absence of factory chimneys is very notable. There are printing-offices, but the Italian book-trade is centred at Milan. The chief industry is the manufacture of small mosaics, small bronzes, of statuary, casts, and pictures, either original or copies of the works of the great masters.

All the necessaries of life have to be imported from a distance, the Campagna which extends for many miles around Rome being uninhabitable on account of the malaria. It is an unenclosed and untilled waste, roamed over by herds of half-wild cattle. Corn and wine are brought from Tuscany, and from the fertile Terra di Lavoro near Naples. The prosperity of the city depends on the expenditure of the courts of the Quirinal and the Vatican, of the army of functionaries in the public offices, of the garrison, and of the foreign visitors who crowd the hotels during the winter months. The railways from all parts of Italy converge outside the city, which they enter near the Porta Maggiore on the Esquiline, and have a common terminus on the summit of the Quirinal close to the Baths of Diocletian. The omnibus service is good, and well-managed tramways traverse several of the broad new streets.

See R. Burn, *Rome and the Campagna* (1870); J. H. Parker, *Archæology of Rome* (1872-80); T. H. Dyer, *City of Rome, its Vicissitudes and Monuments* (2d ed. 1883); F. Wey, *Rome* (trans. from Fr., new ed. 1886); R. Lanciani, *Ancient Rome in the Light of Recent Discoveries* (1888); with other works by Gell, Nibby, Hare, Professor Middleton, &c., and those cited on p. 794.

ROMAN HISTORY.—Rome, the 'Mistress of the World,' the 'Eternal City,' gives name to a political empire which lasted eleven centuries, till its transfer to Byzantium, where it lasted eleven centuries more; also to a religious empire which since 42 A.D. has acquired spiritual sway over a yet larger dominion than its pagan predecessor, and which, in accord with imperial Germany, formed the twin-factor of the Holy Roman Empire, dissolved in 1806.

Colonised in the bronze age by Alban shepherds who migrated from their hills in fear of volcanic disturbance, Rome, according to her officially adopted legend, dates from 21st April 753 B.C., when Romulus, first of her seven kings, settled on the Palatine mount. From his quadrilateral stronghold—*Roma quadrata*—he made conquest of the Capitoline and Quirinal. After his successor Numa, the Cælian was annexed by Tullus Hostilius and the Aventine by Ancus Marcius. To the hills, now five under Tarquinius Priscus the fifth king, were added the Esquiline and Viminal by Servius Tullius, who walled in the seven with a stone fortification. So that under her seventh and last king, Tarquinius Superbus, the City of the Seven Hills was already 'built for empire,' on marshy soil made habitable by drainage, and connecting with the seaboard by the Tiber—a waterway so clearly the 'outlet of her supremacy' as to warrant the derivation of 'Rome' and 'Romulus' from the *Rumon* or river.

Latin in population, with a Sabine infusion, Rome was divided into three tribes—the Ramnes, the Tities, and the Luceres, and again into thirty *curiæ*. The tribal division disappeared early; that into curiæ lasted well into republican times. Out of the curiæ, originating in common religious observances, grew the *populus Romanus*, including all freeborn Romans. Its king (*rex*) was not always hereditary either in his regal or his religious capacity, nor merely elective. When a king died, his successor was chosen by the heads (*patres*) of families (*gentes*). These patres—the guardians of religious observance, of popular right, of state interests—had power to choose a provisional king (*inter-rex*), who, with the patres for assessors, decided on the new king, who was then proposed to the curiæ in assembly (*comitia curiata*) and, if approved, confirmed by the patres. The king had now absolute authority, civil, religious, and military. The patres were his councillors—the senate—having the above indicated powers, always subject to the king, who consulted them at pleasure, and filled up vacancies. In solemn assembly the Romans met in the Forum under the king or inter-rex, who put questions to the vote, when each curia voted in turn, its vote being determined by the majority within itself, and the preponderance of these votes deciding the result.

Romulus, Numa, Tullus Hostilius, and Ancus Marcius—the first and third Latin, the second and fourth Sabine—are little more than legendary names; the warrior chief Romulus typified by his *Roma quadrata* and *Comitium* or place of assembly in the Forum; the priestly Numa by his Temple of Vesta and his Regia close to it; the statesman

Tullus Hostilius by his Senate House (Curia Hostilia); and the administrator Ancus Marcius by his state-prison, his bridge across the Tiber, his fortification of the Janiculum, and his founding of the seaport Ostia. In Tarquinius Priscus (616–578 B.C.) we have an Etruscan and less shadowy Romulus, admitting into the senate a hundred new patres from conquered Latin states, and laying out the Circus Maximus for the entertainment of the people. Servius Tullius, on Tarquin's initiative, distributed all freeholders (for military purposes primarily) into tribes, classes, and centuries. Drawn up in order of battle, the centuries (bodies of one hundred) in front were composed of the wealthier citizens as better able to equip themselves for attack; behind them came the centuries of the second and third classes, poorer and less fully appointed—the three forming the heavy-armed infantry; while centuries of the fourth and fifth classes, poorer still and correspondingly equipped, held the rear. The full strength of the freeholders was divided into two equal parts—the *seniores* and the *juniores*, the latter engaged in active duty, the former as reserves. Each corps consisted of 85 centuries or 8500 men—i.e. of two legions, each about 4200 strong, auxiliary to which were the sappers and trumpeters. Finally, the six centuries of cavalry were supplemented, from the wealthiest citizens, by twelve more. For the army thus organised Servius drew levies from his four regions, corresponding to his four tribes, the Suburan, the Palatine, the Esquiline, and the Colline. These tribes included freeholders outside the gates, also entitled to meet and vote with the centuries at their comitia (*comitia centuriata*). Under her seventh and last king Rome became formidable throughout Central Italy, and owed to him the Temple of Jupiter Capitolinus, and the *Cloaca Maxima*—the drainage system tapping the hills around the Forum and carrying the waste into the Tiber. But Tarquin's rule was so masterful as to drive the people to revolt, the last provocation being his son's outrage on the noble Lucretia. When engaged at a siege near the coast he was dethroned; he and his race were exiled in perpetuity, and regal government replaced by the Republic. Three great efforts to reinstate him were defeated, and he died at Cumæ.

The Republic.—The regal check on them withdrawn, the patricians made their power so felt by the plebeians as to start a conflict between them lasting two hundred years. The king was now represented by two consuls, elected annually, and from the patrician order. The plebeians, freeborn citizens as they were, retained their votes by classes at the *comitia curiata* and by centuries at the *centuriata*, but many of them were attached as clients to patricians who commanded their votes, and all of them were excluded from the higher offices of state. Unable to elect one of themselves consul, the plebeians had not even the power to carry the patrician candidate they favoured, being in a minority in the *comitia centuriata*, and, again, in a greater minority in the ultimate and decisive assembly, the *comitia curiata*. The absolute authority wielded by the consuls they felt to be still more oppressive when, in state crises, it was merged in a dictator; so their first attempt to safeguard their liberties and lives was directed at the consular power. The first advantage they gained was the 'right of appeal,' by which no magistrate (the dictator excepted) could subject a Roman citizen to capital punishment unless with approval of the *comitia centuriata*. Power to extort such rights the plebeians possessed in their military capacity, refusing, as soldiers, to serve unless their demands were conceded. The secession of their legionaries to the Mons Sacer, on the Anio three miles off, secured them annually elected magistrates of their own, *tribuni plebis*, with power to protect them against the consuls. From two the tribunes were increased to five, and by 449 B.C. to ten. In no sense a magistrate, the tribune was a check on authority, and his power developed gradually till the tribunate, formidable at the close of the Republic, became still more so under the empire. By the Publilian law (471 B.C.) the assemblies convened by the tribune (*concilia plebis*) were made legal; not yet their decisions (*plebiscita*). At these the voting was by tribes, not by curiæ or centuries, whence the object of the tribunes was to add as many to the tribes as possible. To become member of a tribe it was necessary to be a freeholder, and so the tribunes, to multiply freeholders, agitated to secure for the plebeians their share of the *agri publici* or state-lands. Having partially succeeded in this, they won another advantage from the ever-resisting patricians—the appointment for one year of a commission of ten patricians (*decemviri*) to make public a code of law binding on patrician equally with plebeian. This code—the famous Twelve Tables—substituted written and published law for that unwritten code which, confined to the patrician few, was always interpreted in their interests. An attempt to reappoint, possibly to perpetuate, the decemvirate caused another secession; the consuls were again created; and from the growing vantage-ground of their *concilia*, increased by accessions to the plebeian order from without, the tribunes extorted the recognition of the *plebiscita* as legally binding on patricians. The *concilia*, now become *comitia tributa*, could henceforth carry reforms which, if sanctioned by the patres, had the validity of state-law. Another concession gained was intermarriage between plebeian and patrician, and thereafter the consulate—still the patrician stronghold—was attacked. The two consuls were replaced by six military tribunes drawn from either order. Of these consular tribunes the plebeians generally had the majority until, obstacles and delays notwithstanding, the Licinian and Sextian laws were passed (367) replacing the consular tribunes by consuls, two in number, of whom one at least should be a plebeian; enlarging the priestly college from two to ten functionaries, of whom plebeians were to constitute half; relieving the poorer plebeians from debt; and promoting their interests by advantageous reforms in the ownership and cultivation of land. Patrician monopolies shrunk rapidly. In 356 the dictatorship, in 350 the censorship, in 337 the prætorship, and in 300 the colleges of pontiffs and augurs were thrown open to plebeians. The *patrum auctoritas*, or control by patricians of the decrees (*plebiscita*) of the people in assembly, became a dead letter; and the two hundred years' conflict issued in the recognised validity of all measures carried in the *comitia tributa*—a conflict memorable not only for the ability displayed by either order, but for the respect for law observed equally by both.

For her first fifty years of republican life Rome expanded little. Nearest her were the Latins, the Volscians to the south-east, the Æquians to the east, and the Hernicans between the two last. Allying herself with the Latins and Hernicans, she kept the Volscians and Æquians in check till her policy became triumphantly aggressive in the sixty years between 449 and 390. Having razed the south Etruscan stronghold, Veii, she pushed northward to the Ciminian forest, whence she drew down on her the Celtic conquerors of north Etruria, who, defeating her on the Allia, took and sacked the city, all but the Capitol. Recovering rapidly from this disaster, she riveted her hold on south Etruria, gradually subjugated her old enemies and

allies, the Volscians, Æquians, Latins, and Hernicans, and dominated Central Italy from the Ciminian forest to the Latin shore. The Sabellian tribes of the Apennines now gave her trouble. The most powerful of these, the Samnites, had overrun Campania; but from this she dislodged them, and, in spite of a formidable revolt extending from the Sabine Hills to the Latin shore and Campania itself, she made good her command of plain and seaboard, lying compact and firm between north Etruria with its detached cities, the Apennines with their miscellaneous tribes, and Southern Italy with its enervated Greek population. The Samnites, in a second war lasting twenty-two years, failed to get the better of her; in a third, with the northern Etruscans and the Celts as allies, they made a last attempt to crush the growing giantess. This too she defeated after desperate conflicts, in which she purchased victory dearly: the Celts were shattered; the Etruscans bought peace by heavy indemnities; and the Samnites on honourable terms became her allies. In characteristic fashion she proceeded to consolidate what she had won, planting 'colonies'—i.e. agricultural garrisons —of Roman citizens wherever their presence was required, and in this way controlling Central Italy from Adriatic to Mediterranean. At the invitation of Greek Tarentum, beset with marauding hordes, she successfully intervened in the south, till in turn Tarentum, incurring her hostility (281–280), brought King Pyrrhus of Epirus to repel her. At first the Epirotes prevailed, but their two victories were as costly as defeats, and in a third great battle at Beneventum (275) they were so punished that Pyrrhus returned to Greece. The fall of Tarentum shortly after left Rome dominant in the peninsula from the extreme south to the Ligurian and Celtic frontier. *Divide et impera* was her policy—detaching the subject states or tribes from each other to draw them more closely to herself, leaving them 'home rule,' but reserving the safeguard of coast and frontier and power to make peace or war with the outside world. Among her outlying communities the colonies of *cives Romani* above mentioned ranked first; next came those Latin towns which enjoyed the full franchise, this being sparingly conceded to other communities, of which the lowest received civil but not political rights, their members excluded from the tribes, and, as soldiers, serving not in Roman legions, but in contingents apart. To the urban communities within her pale Rome gave self-government liberally, with assemblies, senates, and magistrates, always, however, subject to the central authorities —the Roman consuls, prætors, and censors. For the administration of justice these colonies and enfranchised towns were annually visited by the prætor's representatives, called prefects, who also assumed control of such communities as were without local government. The military system was modified till the old citizen army, with its order in battle determined by civic rank, became the professional institution in which superior fighting power and experience were primary considerations to be paid for accordingly. On distant campaigns the consul in command received extension of his *imperium*, out of which grew the 'proconsul,' empowered to hold the field till the war was at an end.

Eleven years after her victory over Pyrrhus Rome engaged with Carthage in her mighty struggle for the empire of the Mediterranean. To secure her expansion westwards she had first to expel the Carthaginians from Sicily. Having gained to her side the Syracusan king Hiero, she took Agrigentum, and in 260, with her first naval armament under the consul Duilius, she signally defeated Carthage on Carthage's own element. Following up this advantage, she transferred the war to Africa, and was at first so successful as to recall a considerable part of her forces. But her consul Regulus, whom she left behind, was worsted and made prisoner, a series of naval disasters ensued, and Carthage seemed about to regain more than she had lost of Sicily, when the consul Catulus (241), in command of a splendid fleet, gained a decisive victory over the Carthaginians, who thereupon undertook to evacuate Sicily and the adjacent islands. This ended the first Punic war, twenty-two years in duration, the result to Rome being her acquisition, not only of Sicily, which she henceforth governed as a 'province,' but (a few years later) of Sardinia and Corsica, also governed like Sicily by magistrates sent every year from the capital. Finding Rome her match at sea, Carthage resumed hostilities by acquiring a foothold in Spain, which was to become her military basis for further operations against her rival. Under Hamilcar, the great general who conceived this plan, she occupied the peninsula as far as the Tagus; Hasdrubal continued the work of subjugation till his death (221); and finally Hamilcar's son Hannibal, who, with more than his father's genius, shared all his father's antipathy to Rome, pushed the conquests of Carthage up to the Ebro.

Meanwhile Rome herself was engaged in subduing the Celts in the valley of the Po, and having planted three colonies—Placentia, Cremona, and Mutina—to safeguard her new possessions, she turned her attention on Spain, and got Carthage to make the Ebro her northern boundary in the peninsula. But such engagements could not long be respected. Saguntum, a Greek colony in alliance with Rome, on the east coast of Spain, was besieged and taken by Hannibal, though a Roman embassy to Carthage had protested against the operation. The second Punic war was declared in 218, and Rome sent one army under P. Cornelius Scipio to Spain, and another under T. Sempronius Gracchus through Sicily to Africa. But Hannibal's plans, long matured in secret, were carried out with unexampled celerity. Scipio had got no farther than Massilia when Hannibal, having crossed the Pyrenees, was already at the Rhone; and after fighting his way over the Alps against every obstacle—the hostility of the tribes included—descended on Cisalpine Gaul with but 26,000 surviving of his army of 59,000 men. Defeating the Romans on the Ticino and the Trebia, he realised his expectation of getting the Celts to join him, and in the spring of 217 he pushed on to the city through east Etruria. He annihilated the consul Flaminius at Lake Trasimene; and from Spoletium within a few days of Rome he turned eastward, plundering as he went, and paused for supplies in north Apulia. The Romans, now gravely alarmed, elected a dictator, Quintus Fabius Maximus; but his masterly inactivity did not satisfy them, and they sent two consuls with a numerous army to hurl back the invader. In the great battle of Cannæ Hannibal's victory was complete—the Romans losing 70,000 men to Hannibal's 6000, and Southern Italy—all but the Latin colonies and the Greek coast-towns—came to his side. Macedonia and part of Sicily declared for the conqueror, and the Greek communities one by one were surrendering to him. The Romans tried to recover Campania and laid siege to Capua, and this brought Hannibal up from Tarentum. He even marched directly on Rome herself and rode up to the Colline gate; but he retired unable to make any impression on the city and its defenders; he conciliated no allies; and fell back on South Italy, leaving Capua an easy prey to its besiegers. Five years had done little to encourage the Romans, till Hasdrubal, defeated in Spain, crossed the Alps and skirted the east coast

of Italy, to reinforce Hannibal in the south. But he was beaten and killed on the Metaurus by Nero, who, turning southwards, marched up to Hannibal's camp and threw Hasdrubal's head into it. The war in Italy was virtually at an end. Hannibal's attempt on Rome had failed. Meanwhile young Publius Scipio, having driven the Carthaginians from Spain, returned to the city with the proposal to descend on Carthage herself. The senate, not without misgiving, consented. Scipio's successes in Africa compelled Hannibal to leave his vantage ground in Southern Italy and come to the aid of his hard-pressed compatriots. The great battle at Zama left Scipio the victor, Hannibal a fugitive, and Carthage suing for peace. Her request was granted, and she retained her territory, but bound herself to undertake no wars outside Africa and (without the consent of Rome) no wars inside. She surrendered nearly all her navy and had to pay an indemnity of 10,000 talents in fifty years. Rome was now (202) mistress of the Mediterranean, but she had to consolidate her acquisitions. Sicily, easily ruled under a prætor, became her granary and the provision store for her legions. Spain, however, required prætors invested with consular power and a permanent garrison of four legions to keep her in order. The insurrection of Viriathus lasted till the fall of Numantia after a memorable resistance; and not before Scipio Africanus the younger took it in hand could the country really be called pacified and its rich resources made available. Meanwhile Rome had a secret dread of the resuscitation of Carthage, and she courted every pretext for renewing war with her and razing her to the ground. That came in 151 when Carthage, goaded by Masinissa's forays, broke her treaty obligations to punish him. In 149 Rome laid siege to her, and by 146 she was stamped out from the roll of great cities. Her territory was now the Roman province of Africa, protected by Masinissa's three sons, who ruled Numidia. In Italy herself the cities that had declared for Hannibal were severely punished. In the north the Celts forfeited their separate political existence. In the south Roman settlers occupied confiscated lands—nearly everywhere but in Apulia and Lucania; and even the Latins soon felt the preponderance of the Roman element, which tended more and more to assert itself.

Fifty years after she became mistress of the west, Rome had also become the mightiest state in the east, first by conquering Philip of Macedon, who had been the ally of Hannibal, and whose ambition to dominate the Ægean drew Rome into the second Macedonian war (200), which ended in Philip's defeat at Cynoscephalæ and the reduction of Macedon to a minor power. Next came the 'liberation of Greece,' which, with the alliance that followed, enabled Rome to proceed against Antiochus, king of Syria, who in 197–196 had overrun Asia Minor and penetrated into Thrace. Beaten by land and sea, Antiochus sustained a decisive defeat at Magnesia in Asia Minor, and fell back behind the Halys and Taurus range, to the west of which all the kingdoms and communities were now under Rome's protection. Western Greece, however, began to give trouble, and Philip of Macedon's successor, Perseus, incurred a final encounter with the Romans in a third Macedonic war, terminating in his utter rout and capture at Pydna (168). So that, twenty-two years thereafter, Macedonia had sunk into a Roman province, whose governor came gradually to control the Greek states till the whole peninsula was subservient to Rome. Steadily strengthening her hold on Asia Minor, Rome further assumed the guardianship of the king of Syria; while in Egypt, which in 168 had acknowledged her suzerainty, she restored a *protégé* of hers to the throne, at the same time, true to her policy, dividing and weakening his power. From Syria to Spain the Mediterranean was now a Roman lake, but her authority was better established in the west than in the east. In the former her provincial government was fairly established; not so in the latter, which, besides its more elastic frontier, possessed a civilisation in some respects superior to her own.

With the establishment of her supremacy without began Rome's troubles within. The ennobled plebeians (*nobiles*) combined with the old patrician families (*optimates*) to exclude all but themselves from high office or the senate. The constitution had become an oligarchy in which the comitia, nominally supreme in electing magistrates and passing laws, were practically superseded. The prestige of having saved Rome from Hannibal and raised her to undisputed empire belonged to the aristocratic senate, while the graver disasters (at Trasimene and Cannæ) were due to the people's favourites. But that prestige was getting gradually impaired by economic failure at home and confusion abroad, and the people were awaking to a sense of the power the senate had taken from them. The small holders, particularly in Etruria and South Italy, burdened with military service and competing vainly with foreign importations of corn and labour, deserted the farms on which they could neither thrive nor live, and the multiplication of colonies throughout the peninsula gave but temporary relief. To arrest the imminent annihilation of these freeholders—Rome's main-stay—Tiberius Gracchus, the tribune (133), proposed his reform, which was practically the first of a series of attacks on senate-rule. Occupiers not recognised by the Licinian law were to be evicted; occupation was not to extend beyond 1000 acres; public grazing-lands were to be reclaimed for tillage. The senate opposed him strenuously, and he was killed in an incidental collision; but his struggle was renewed on a larger scale by his brother Gaius, who curtailed the senatorial power by getting the comitia to deprive it of privilege after privilege. He, too, fell in a brawl, and by 111 his reforms had already been frustrated and a quite new aspect given to the agrarian question. But the popular party had been taught its lesson by means of the tribunate to reassert its power in the comitia to work out its salvation. Gaius Gracchus had been dead ten years when the client-state Numidia was seized by Jugurtha, who had supplanted its legitimate governors and insulted the Roman name. The popular leaders insisted on his chastisement; but the war, mismanaged under patrician officers, was carried to a triumphant close by the people's favourite, the low-born, illiterate, but efficient Marius, who in January 104 brought Jugurtha in chains to Rome. Still greater successes awaited their hero. Having annihilated the Cimbri and Teutones, who had inflicted four defeats on the patrician generals, and been made consul for the sixth time, he aided the popular vindicators, Saturninus and Glaucia, to harass the senate. But the advantages they secured were small, their violence had to be curbed by Marius himself, and at last the populace turned upon and killed them. The rise of Marius, however, was fraught with far-reaching results. His six consulships, his intervention as a soldier in politics, his military reforms, by which all classes, irrespective of rank or means, were admitted to the legion, and the compulsory levy replaced by volunteer service under a popular leader were epoch-making in the revolution.

The commercial class—soon to develop into the equestrian order—had by their power in the courts and their increasing exactions as farmers-general (*publicani*) been at feud with their controllers, the magisterial class in the provinces, and fiscal reform

became urgent. The Italian communities—the allies of Rome—had long felt their burdens increase as their privileges waned, and they demanded their share of the conquests they had helped to achieve. Promises of relief and expectation of securing the Roman citizenship had brought them in crowds to the capital, to be driven back again by an exclusive senate and people. The tribune Drusus strove to bring about fiscal reform and the redress of the Italians, but though he carried his laws he could not make them valid, and finally he was assassinated. The equestrians remained supreme in the courts, while the murder of Drusus roused the irritated Italians to rebellion (90–89) in the central highlands and the south especially. The Social War began, the insurgents aiming at the erection of a new Italian state governed on the lines of the Roman constitution. To suppress them the two consuls of the year, each with five legates, including Marius and his future rival Sulla, headed the legions, but were disastrously beaten. In the north, however, Marius and Sulla, and in Campania the consul Cæsar, were partially victorious, but so partially that reform after reform had to be conceded, till the Italians could obtain the franchise merely for the asking. The war at length died out by the absorption of the insurgents into the Roman citizenship; but the internal troubles continued. The new citizens enlarged their political claims, the senate was distracted by personal feuds, economic distress prevailed among all, and a war with Mithridates threw Marius and Sulla into rivalry as to which should command the expeditionary force. The action of the tribune Sulpicius in dealing with this complicated crisis intensified it the more. He introduced laws to entrust Marius with the Mithridatic campaign, to allow the new citizens to vote in all, not in a restricted, number of tribes, to confine the freedmen to the four urban tribes no longer, to unseat any senator more than 2000 denari in debt, to recall from exile those suspected of complicity with the Italian insurgents. Every one of these proposals, bitterly contested, would yet have become law but for the consul Sulla, who, heading in Campania the legions assigned him in the Social War, marched on Rome—the first consul who ever invaded her with her own troops. The flight of Marius and Sulpicius left him free to impose arbitrary measures, among them that by which the sanction of the senate was required before any bill could be entertained by the comitia; and, having seen the consular elections safely through, he set out against Mithridates (87).

In his absence Cinna attempted as consul to carry the reforms of Sulpicius, but was driven from Rome amid the massacre of the new citizens in voting assembly. He in turn rallied round him the legions in Campania, and joined by the veteran Marius, who reappeared from Africa, he entered Rome and was recognised as consul, as was Marius himself (for the seventh time). After a brutally vindictive massacre Marius died (86), and Cinna remained supreme, securing the consulship to himself and a confederate, and getting the newly-enfranchised Italians enrolled in all the tribes. In 84 he died, and next year Sulla, having concluded a peace with Mithridates and left Asia tranquil, landed at Brundusium with a powerful army, including many of the *nobiles* who had fled from Cinna. Resistance, nowhere formidable, he quickly overcame and (82) entered Rome, to find his lieutenants triumphant in North Italy and to annihilate the remnants of the Marian party just outside the city. But he failed to use his power, absolute as it was, for the abatement of long-standing evils and the prevention of coming disasters. Triumphant everywhere, he instituted a reign of terror—slaying, proscribing, and confiscating through revenge or suspicion. For nine years his rule as dictator, in spite of much salutary administration, was marred by a remorseless partisanship which left the future to take care of itself—creating in the sons and heirs of the proscribed and dispossessed the handy tools of agitation, justified as this increasingly became by ruined agriculture, by the multiplying of *latifundia* with their necessary evictions, and by the rapid disappearance from nearly all Italy of her substantial freeholders. Life and property, already widely forfeited at his bidding, were still further endangered by brigandage, which culminated in the formidable rising of Spartacus, who held out for two years (73–71). Still fortifying the senate, Sulla left the tribunes with no power of interdict save in protecting individual plebeians, and he excluded them from ever holding high office; he took from the equestrians the control of the courts, giving it back to the senate, to which he also restored its exclusive rights in the colleges of pontiffs and augurs. He extended the application of the criminal law—a wise measure; but he did more than any Roman before him to facilitate the rise to supreme power of any ambitious governor of a province or leader of a provincial army. He forged in fact the weapon by which his system fell (70).

In Spain Cneius Pompey, one of Sulla's favourites, held a commission from the senate to crush the Marian governor Sertorius, who had defeated successive proconsuls sent to humble him. With the submission of the natives following the murder of Sertorius he returned to Rome, and found the opposition to Sulla looking out for a leader to effect a change of government. His ambition to have a triumph, to be made consul for next year (70), and by consequence to receive command in the east, was gratified for the sake of his name and influence. He was elected consul with Crassus, the victor over Spartacus, their troops being just outside the gates, and on the triumph and ovation granted to the two generals ensued Pompey's fulfilment of the bargain—the reinstatement of the tribunes in their authority and of the equestrians in the courts, and the weeding out from the senate of Sulla's notorious tools. The example set by Sulla was improved upon, and henceforth the republican constitution was at the mercy of the strongest leader supported by the strongest battalions. Pompey's next move was to obtain command abroad, and after some delay this was found in a mission to clear the Mediterranean of pirates. For this formidable undertaking the tribune Gabinius secured him large powers, tenable for three years, including authority over all Roman magistrates in the Mediterranean provinces for fifty miles inland. These, backed by a splendid fleet and army, were yet further enhanced by the tribune Manilius, who got Pompey entrusted with the campaign against Mithridates and with the charge of Roman interests in the east. The wiser senators gave ominous warning against these measures, but were powerless against tribunes and people, seconded by equestrians, who as the commercial class drew much of their wealth from Asia. So Pompey set out in 67. Meanwhile Cæsar had come to the front—a patrician, who was also the nephew of Marius and son-in-law of Cinna, and whose consummate ability, shown in the revindication of the tribunate and the carrying of the measures in support of Pompey, had full scope now that Pompey's back was turned. He deepened his hold on the people by avenging the injured names of Marius, Cinna, and Saturninus, pleading for the children of the proscribed, and bringing Sulla's headsmen to justice.

Rising in popular favour by his efforts to enfranchise the Transpadane Latins and his munificent promotion of public works and entertainments, he spared no means, constitutional or the

reverse, to put himself on even terms with Pompey before that magnate's return. Crassus, the millionaire, he found a tractable auxiliary, in concert with whom he was rapidly gaining powers hardly inferior to Pompey's, when the Catilinarian conspiracy (63), exposed and defeated by Cicero as consul, involved Cæsar in the ill-will in which the middle classes held popular adventurers. Pompey had now returned to importune the senate for the ratification of his measures in Asia and the bestowal of land on his legionaries. His demands met with determined opposition, till Cæsar, posing as his friend, formed with him and Crassus the coalition—the first, if irregular, triumvirate—of which Pompey was the head, Cæsar engaging to see Pompey satisfied, and Pompey in return promoting Cæsar's candidature for the consulship. Cicero strove to undo a coalition he knew to be fatal to his ideal of a conservative republic, but in vain; he saw the senate weakened by a quarrel with the equestrians and its authority impugned by the friends of Catiline, who arraigned him for having, with the senate's approval, violated the law in putting to death the conspirator's lieutenants. The triumvirate in 59 fulfilled its compact. Cæsar obtained the consulship and the satisfaction of Pompey's demands, conciliated the equestrians at the expense of the senate, and carried an agrarian law enabling him one day to reward his faithful troops. But his crowning success was his obtaining for five years the military command of Cisalpine Gaul, Illyricum, and later of Transalpine Gaul, from which he could scan every political move in Italy. Next year (58) Clodius, the tribune, proceeded against Cicero, who, thrown over by Pompey and with Cæsar out of reach, fled from Rome and was outlawed—to be recalled (57), and his outlawry annulled by senate and people, in the reaction induced by Clodius's misdeeds. Cicero, to fortify the constitution, renewed his efforts, only to fail and retire from public life. The triumvirs tightened their alliance. Cæsar secured his command for five years more; Pompey and Crassus were elected consuls, and Pompey received as province the two Spains, with Africa, and Crassus, Syria—the Roman empire being at the mercy of all three, not, however, for long. Crassus was defeated and killed by the Parthians (53), and Pompey was slowly but surely drawn into antagonism with Cæsar. Rome, in the absence of efficient government, was in ceaseless turmoil, till the senate in despair induced Pompey to remain in Italy, electing him sole consul (52), giving him, with fresh legions, five years' more command, and, in fact, pitting him as its champion against Cæsar. It tried to reduce Cæsar to impotence, either by keeping him at his post, and so baulking his candidature for the consulship, which required his presence in the capital, or, by terminating his command at its legal expiry, to detach him from his troops and make him pursue his candidature in Rome as a private individual. Negotiations between him and the senate only left the latter more uncompromising; and with well-inspired audacity he crossed the Rubicon (49) and advanced on the city. Unprepared for such a move, Pompey and most of the senatorial party, including the consuls and many nobles, withdrew to Greece, leaving Cæsar to enter Rome in triumph. The mighty duel between the two chiefs had begun. After a brief pause Cæsar hurried to Spain, and, victorious over the powerful armies of Pompey's legates, returned to Rome, where, appointed dictator in his absence, he almost immediately renounced the post, and as consul for 48 crossed over into Greece and dealt Pompey a crushing blow at Pharsalia. The Pompeian cause struggled on till 45, when it collapsed at Munda, and Cæsar was made by the senate dictator for life. Unlike Sulla, he used his power with a clemency, a statesman-like wisdom, and a patriotism that made men almost forgive, if not forget, how he came by it. The roll of his salutary reforms and innovations is indicated elsewhere (see CÆSAR); but here our interest centres in the significance of the empire he initiated. That meant the merely nominal retention of the old constitution with its senate, its comitia, its consuls, and its tribunes, under the fiction that the supreme power was held at the people's will. Really it meant an autocracy reaching to the remotest province, resting in the last resort on the military arm—an autocracy whose founder took the title 'imperator,' as expressing his arbitrary and uncontrolled *imperium*, in token of which he appeared with the laurel wreath and the triumphal garb and sceptre. From the senate which he summoned and presided at to the assembly where he carried laws, and the court where he dispensed justice, he was everywhere the chief magistrate. The empire he designed to bequeath was to be bounded by the ocean on the west, by the Rhine and Danube on the north, by the Caucasus and the Euphrates on the east, and by the African desert on the south, and within these limits he wanted to extend the Roman citizenship, and admit their communities to share the government. This scheme of consolidation he did not live to carry out; but he reduced fiscal burdens in the provinces and curbed the authority of their governors.

His assassination, March 15, 44, was followed by an attempt, powerfully aided by Cicero, to win back the old republican constitution; but Cæsar's representative, Antony, at the head of seventeen legions, combined with Lepidus and Octavian, just made consul, in spite of his youth, to form the second triumvirate, which began operations by proscribing and assassinating its opponents—Cicero among the number. A stand made at Philippi by Brutus and Cassius was crushed by Octavian and Antony, after which the triumvirs divided the empire between them—Octavian taking Italy and the west, Antony the east, and Lepidus Africa. Antony contemplated with Cleopatra an eastern empire, while Lepidus, having lost Africa, was exiled, and the death of Sextus Pompeius, after the destruction of his fleet in the Mediterranean, left Octavian, who had been sagaciously strengthening his position in the west, with only Antony for rival. The inevitable collision took place off Actium (31), and the victorious Octavian, after the suicide of Cleopatra and her paramour, remained master of the east (29). Two years more saw him in Rome, the grand-nephew and heir of Cæsar, armed with authority to mould a government out of republican and imperial institutions. For this he had every qualification.

The Empire.—Augustus began (28–27 B.C.) by a restoration of the republic, with himself as *princeps*, the republican constitution being retained, while the *princeps* held the real power. By decrees of the senate he assumed, in token of supreme dignity, the cognomen 'Augustus,' and also the *proconsulare imperium*, which far exceeded the old proconsular command in width of area and length of tenure, the provinces being governed by legates appointed and controlled by him alone. Of army and navy he was commander-in-chief, raising or dissolving both, and declaring or concluding war at pleasure. His *imperium*, contrary to precedent, he was allowed to retain within the *pomœrium*, the city's consecrated boundary, giving him there the power wielded by a proconsul in his province. Augustus refrained from exercising this in Rome, but as tribune of the people he controlled the entire administrative machine, so that, what with proconsular command and the *tribunicia*

potestas, he possessed powers which made all others of minor importance. Head of the state, he was also head of religion as *pontifex maximus*, and from time to time he had privileges and exemptions decreed him by the senate. Anxious as he was to retain the outward show of republican institutions, they declined under the weight of his personal influence. The comitia were 'transferred from the Campus to the senate,' which in the succeeding reign nominated and voted for candidates to all magistracies except the consulship, these magistracies being in request for the social distinction they carried, not for any power they conferred. The emperor as *princeps* virtually appointed them, and his subordinates transacted their work. The consulship itself, the highest ambition of the private citizen, and a prerequisite for provincial command, was shorn of its duties, excepting those of presiding in the senate and regulating its proceedings. Prætor, ædile, tribune ceased to be what they were under the republic—the last named swallowed up in the *tribunicia potestas*. Only the quæstor retained something of the old significance. But the senate, in theory at least, continued to represent the republican system. To it, in the absence of a princeps, the real power reverted, and from it the new princeps received the authority and the privileges still derived by a fiction only from the people. But the princeps was really nominated by the army, and though the senate was formally deferred to as beyond his jurisdiction, he could in his capacity as censor man it as he chose, till it survived but in name, like the comitia and the magistracies. These innovations had their compensating side. The provinces, previously at the mercy of nominees of the Roman people, now under the control of the princeps or emperor, gradually gained equality with the Italians as Roman citizens, and made corresponding advances in civilisation and prosperity.

With the establishment of the imperial system the fortunes of Rome are reflected in those of her emperors, to narrate which would be to repeat the biographies given elsewhere. Henceforth we have but to deal with epoch-making events. Tiberius (14–27 A.D.) had little of his predecessor's esteem, genuine or assumed, for republican institutions. The senate became more of an imperial tool, all power more and more embodied in the princeps. The simple mode of life affected by Augustus was replaced by a splendour conspicuous in multiplying palatial residences, in the bodyguards, the courtiers, the aulic etiquette subsequently carried to unheard-of lengths. The population of Rome, from the highest to the humblest, deteriorated—a wealthy, indolent, luxurious upper class maintaining mobs of dependents, below whom was the proletariat, which the emperor from time to time provisioned and amused. Secure against public opinion, Tiberius relied on the military arm, and in Rome herself had his prætorian guard, some 6000 strong, within ready call. These troops acquired a power which overshadowed all others as the emperors became more and more dependent on them. Caligula (37–41) did much to show with what depravity the imperial system was compatible, and in the succeeding reigns of Claudius (41–54) and of Nero (54–68) the evils it could generate had further illustration. The former, made emperor by the prætorians in defiance of the senate, was the creature of profligate and scheming wives, the second of whom poisoned him; the latter perpetrated every crime or excess within his power, till, at the age of thirty, he committed suicide, to the joy of Romans, provincials, and of the army itself. Like his two predecessors he had first been hailed by the soldiers as imperator, and thereafter invested with power by the senate; but with him the succession from Augustus expired; and whom to replace him by was the question. Galba (69), the nominee of senate and soldiers alike, incurred the enmity of the prætorians, who killed him in the interests of Otho (69), now proclaimed emperor. But the legions on the German frontier preferred their own general, Vitellius (69): Otho, defeated at the head of his prætorians, committed suicide, and Vitellius succeeded him, in turn to be murdered after being disavowed by the army in Syria, who proclaimed their commander, Vespasian. With him began the Flavians (69–96), strong and beneficent emperors, save one. Vespasian (69–79) disclaimed the divine attributes associated with the Cæsar-worship of his Julian predecessors, and not only returned to the simpler life and more modest court of early imperial days, but tried to resuscitate the authority of the senate, and even ostentatiously to keep himself within the law and to promote the welfare of the people. Titus (79–81) improved on this sound policy, while providing public baths and the amusements of the Colosseum; but his brother Domitian (81–96) became infamous for profligacy and cruelty, popular only with the worst of his prætorians. Nerva (96–98) was restoring the best traditions of the Flavii, when, after sixteen months' reign, he was murdered by the prætorians, impatient of his austerities—not, however, before he had adopted as son and successor Trajan (98–117), commanding on the Rhine. The assumption of empire by a born provincial illustrates the gradual weakening of Rome's connection with her rulers, whose seat of government became really the military headquarters for the time being. He and the following three emperors gave Rome a century of beneficent rule—the happiest hundred years yet known to her. Living like a plain soldier, he conciliated the senate by the deference he paid it, and the people, whose good he consulted, while keeping the Roman name respected abroad. His adopted successor, Hadrian (117–138), gave up to travel the time spent by Trajan in war, visiting the provinces from the east to Britain, providing them with public buildings, improving the discipline of the army, and indeed the whole administrative organisation. A provincial himself, he adopted a provincial to succeed him—Aurelius Antoninus, a native of Gaul (138–161). He too earned the love of the Roman world, and on his death an adopted son of his, Marcus Aurelius, became emperor (161–180). He was a thinker and moralist, whom necessity made also a man of action, called away to defend the Danube and Upper Rhine. Unhappy in his wife, he was still more so in his son Commodus, and died at headquarters, closing the line of the good emperors. The profligate reign of Commodus (182–192) accentuated still more the ascendency of the soldiers, who killed his upright and austere successor, Pertinax (193), and became for nearly a century the makers and unmakers of emperors. The Augustan system was gone; except on a few insignificant occasions, the senate did not assert its right to nominate; the soldiers, often serving on the frontiers, were the arbiters of empire. The prætorians next sold it to the highest bidder, the rich senator Didius Julianus; but this was resented by the provincial armies, who started their own nominees.

The ensuing conflicts between these 'pretenders' resulted in the triumph of Septimius Severus (193–211), an able, unscrupulous African soldier, who, ignoring the senate, till then the formal ratifiers of imperial authority, set the further precedent of posing as proconsul in the city itself, made the palace, not the forum, the justice-seat, and raised the prefect of the prætorians to power only inferior to his own. Caracalla (211–217), that he might impose on the provinces the taxes

paid by Rome, gave the rights of citizenship to the former, thus equalising all and unifying the empire. His brutal personality has no further interest for us any more than that of his fifteen successors, nearly all of whom came by a violent death, generally at the hands of the soldiers who had set them up. For them the dreary *Augustan History*, or its vivid condensation by Gibbon, must suffice, with our own articles on Heliogabalus, Severus, the three Gordians, Decius, Gallus, and Gallienus. They left the Roman empire weak at every frontier, exposed to the Franks on the Rhine and the Goths on the Danube. The former ravaged Gaul and Spain, the latter Asia Minor and Greece, while the Persians, relieved of the Parthian yoke, had again become a formidable power in the east. In Rome and throughout Italy anarchy and distress prevailed till a temporary revival was brought about by the *Illyrian emperors*—Claudius (268–270) driving back the Goths, and the yet abler Aurelian (270–275), by his victories over Goths and Germans and his successes in the east and west, restoring the lustre of the Roman arms, and, for a brief space, the unity of the empire.

Diocletian (284–305), also an Illyrian, the next great name on the imperial roll, introduced a system of safeguards against dissolution within and aggression from without. He assumed the most capable colleague he could find to share with him the government of the empire. This was Maximian, who, like himself, took the title of Augustus. He further reinforced this dual control by associating with him Galerius and Constantius, able generals, like Maximian, whom he proclaimed as *Cæsares*, below the two *Augusti* in rank, but with the right of succession to these. He himself had Thrace, Egypt, and Asia under him; to Maximian he gave Italy and Africa, to Constantius Gaul, Spain, and Britain, to Galerius the Danubian provinces. Thus internal sedition was suppressed within the empire, and, this distraction removed, the frontier fortifications could be perfected. The Rhine, the Danube, and the Persian boundary were garrisoned at frequent intervals and the barbarians kept in check, while all temptation of the soldiers to sedition was overawed by the repressive measures at the command of the four rulers acting in concert. Rome now ceased to be the one capital. If she remained a capital, it was as the seat of a nominal senate. The *Augusti* and *Cæsares* lived at their headquarters, Diocletian at Nicomedia, Maximian at Milan, Constantius at Treves, Galerius at Sirmium. This was a momentous departure from the tradition by which the emperors had claimed to be but the supreme magistrates of the city and the chiefs of her armies. Rome indeed was less imperial than any town in which the emperor chose to live. The policy of keeping the soldiery estranged from the emperor's presence took the form of increased dignity in his demeanour and mode of life, the oriental magnificence introduced by Aurelian reaching extravagant lengths in Diocletian. He reorganised the services, civil and military, under new titles, which came to be more valued than the republican consul or senator, and typified the completely autocratic power he assumed. So long as he lived his system worked effectively; but after twenty-one years, and in breaking health, he abdicated publicly the power he felt incapable of wielding. His masterful personality no longer felt, rupture between *Cæsares* and *Augusti* ended in civil wars, till the son of the Cæsar Constantius, Constantine, who had himself become Cæsar of the army in Britain, overcame all rivalry, and in 323 ruled the empire single-handed. Christianity, since its rise under Augustus and its spread under Tiberius and the later emperors, had triumphed over the last attempt under Diocletian to crush it by persecution, and the politic Constantine, adopting it as his own religion, made it also the state's. To the tottering imperial fabric it brought new strength, armed with which he proceeded to develop Diocletian's policy of rehabilitation. From Rome he transferred the seat of government to Byzantium, henceforth called Constantinople, commanding by its position the Greek and Asiatic worlds. Remodelling Rome's traditional institutions, he made a new senate, with a large infusion of Greeks, all of his own choosing; he instituted a new *præfectus urbi*, and founded in the 'Rome on the Bosporus' an absolute monarchy. Reducing the number of soldiers under each general, he weakened the army's power to revolt by dividing it into two classes, one for the towns, the other for the frontiers. The same subdividing process he carried into the provinces, splitting them up into districts, which again he rearranged into thirteen larger ones, subject to four prefects, responsible in their turn to the emperor. Multiplying officials who owed everything to him, he made them the nucleus of a new nobility, to supersede the old, and to find their interest in perpetuating his power. These sagacious measures, coupled with the prestige of the new religion, reinforced the empire greatly; but the taxation required to keep it up proved an element of weakness. The costly court and the highly paid officials drained the treasury, which had to be replenished by exactions from the people, who met them from the proceeds of the land they tilled. The forays of barbarians, increasing in number and range, steadily reduced the means of these small holders, who thus, except in profound peace, could not satisfy the tax-gatherers. Farms disappeared, not to be replaced, and unproductive waste-lands encroached more and more within the frontier. The death of Constantine was the signal for civil war among the rival Cæsars, till Constantine's only surviving son, Constantius II. (351–363), succeeded in reuniting the empire under the same house. Not without misgiving he made a 'Cæsar' of his cousin Julian and entrusted him with Gaul, where Julian's success was such as to rouse his jealousy. Constantius accordingly commanded his cousin's legions to start for Persia; but instead of complying they proclaimed Julian emperor and Augustus. Constantius died soon after, and an inevitable collision was averted. Julian (361–363) interests us more by his defence of the Rhine frontier and his Persian campaign than by his 'apostasy' from Christianity. He succeeded in staving off the barbarian inroads on the western provinces; but his diversion in favour of the 'creed outworn' did not survive his last encounter on the Tigris, where he was killed. Jovian, who succeeded him on the battlefield, outlived him a few months, and Valentinian I. (364–375), the next emperor, at the instance of the army which proclaimed him, took as colleague his brother Valens, whom he made emperor of the east. For ten years the dual government prevailed, and the barbarians were kept in check at the Rhine and Danube, but his death found Valens unequal to his post. The Goths, goaded by the Huns in their rear, had thrown themselves on the hospitality of their imperial neighbours, but were so harshly treated that they turned on them and killed Valens in battle (378). They threatened Constantinople, but the next emperor, Theodosius (379–395), made them his allies and even auxiliaries, so that he was able to keep on the throne his colleague of the west, the feeble Gratian. That emperor was murdered (383) by Maximus, whom Theodosius recognised as Cæsar and left in command of Gaul, Spain, and Britain, till Maximus (386), worsted by Theodosius in his attempt on Italy and

Africa, was compelled to acknowledge Valentinian II. as emperor in the west (391). A few months afterwards Valentinian was murdered by Arbogast the Frank, who nominated in his place a creature of his own, Eugenius. Again Theodosius triumphed over the usurper; but after his great victory at Aquileia he died (395), leaving as emperors his two sons—Arcadius in the east and Honorius in the west.

The next eighty years are amongst the most dismal in the world's history. The provinces, drained to inanition by taxation levied for army and court, were further visited by intestine war and barbarian inroads. At first the policy of conciliating the invader, and giving him military command and administrative office, succeeded. But gradually the barbarians established in the east began to aim at conquest in the west, and Alaric the Goth first occupied Illyricum, whence he ravaged Greece, to be driven out by the Vandal Stilicho, the able general of Honorius. Retaining Illyricum, he led his people *en masse* into Italy; but after his crushing defeat at Pollentia he again retreated before Stilicho. On the murder of that officer he returned and besieged and took Rome, which bought him out at a heavy price. Honorius, from his seat at Ravenna, could not be made to concede him the lands he wanted for his people and the post in the imperial army he claimed for himself, so Alaric again appeared before Rome, to accept the office of commander-in-chief under her improvised 'Augustus,' the prefect Attalus. This incapable ruler was displaced by Alaric, who resumed his negotiations with Honorius. These being again fruitless, he took and sacked the city, but died shortly after. His successor Ataulf drew off his people to Gaul, and (419) a succeeding king, Wallia, received formal permission from Honorius to settle in the south-west, where at Toulouse he founded the Visigothic dynasty. Spain, already divided between Vandals, Sueves, and Alans, was in like manner formally made over to those invaders by Honorius, whose authority at his death (423) was on the western continent merely nominal. His successor, Valentinian III. (423–455), witnessed the conquest of Africa by the Vandals and of Gaul and Italy by the Huns. The former, under Genseric, having taken Carthage, were recognised by Valentinian in their new African kingdom in 440; and the latter, the rulers, under Attila, of central and northern Europe, confronted the emperors of east and west alike as an independant power. Attila marched first on Gaul, but the Visigoths, since their conciliation by Honorius, were loyal enough to oppose him, and, commanded by Aetius, signally defeated the Huns at Châlons (451). Next year Attila invaded Lombardy, but got no further, and died (453). In that year Valentinian, the last representative of the house of Theodosius in the west, was murdered; but his nine successors have no claim on our attention here. The outstanding events in the history of Rome are now her siege and sack by Genseric (455), and the quarrel between the Emperor Orestes (a Pannonian) and the barbarian soldiery in Italy—the latter requesting and the former refusing a grant of a third of the lands. The soldiery defeated and killed Orestes, whose son Romulus Augustulus resigned the 'useless purple' in favour of their leader Odoacer (476). The empire of the west was gone, Italy was under a barbarian king, and Rome ceased to be the capital. Thenceforth the history of Rome is merged in that of Italy (q.v.), where will be found such outstanding events as the restoration to the city, or to the pope, of the lands rescued by Pepin (q.v.) from the Lombards, the taking of Rome in 1084 by the Emperor Henry IV., the short rule of Rienzi (q.v.), the sack in 1527 by the Constable de Bourbon (q.v.), the Napoleonic invasion of 1796, the republic of 1849, and the re-establishment in 1870 of Rome as capital of Italy. The history of the Eastern Empire is given at BYZANTINE EMPIRE.

Rome Prehistoric, Regal, and Republican: Gilbert's *Geschichte und Topographie der Stadt Rom im Altertum* (1883–90); and the well-known works of Mommsen (Eng. trans. 1862–66), Peter, Nitzsch, Drumann, Schwegler, Duruy (Eng. trans. 1883–86), and Ihne, superseding in great part the epoch-making Niebuhr and the useful works of Arnold and Long. Rome Imperial: Gardthausen's *Augustus und seine Zeit* (first part 1891); Mommsen's fifth volume (Eng. trans. 1887); Merivale; Gibbon (embodying most of what is valuable in Tillemont); Hermann Schiller's *Geschichte der Kaiserzeit;* Von Reumont; Gaston Boissier's *La Fin du Paganisme* (2 vols. 1891); Hodgkin's *Italy and her Invaders* (1880–85); Professor Pelham in the *Encyclopædia Britannica;* Bury, *History of the Roman Empire* (1893); Shuckburgh, *History of Rome* (1894); and the general histories of Rome by Schmitz, Liddell, Merivale, Gilman, and Pelham, as well as a serviceable abridgment of Mommsen. Rome Mediæval: Gregorovius's *Geschichte der Stadt Rom* (Eng. trans. 1895); Von Reumont; Ranke's *History of the Popes;* Sismondi, *Abbati's L'Italia nel Medio Evo* (1891); and the church histories of Baronius, Robertson, and Milman. Books of interest are Dyer, *History of the City of Rome* (2d ed. 1883); Graf, *Roma nella Memoria del Medio Evo* (1882–83); Lanciani, *Pagan and Christian Rome* (1893); R. Burn, *Ancient Rome and its Neighbourhood* (1895); and see Cerroti's *Bibliografia di Roma* (1893) and Villari's 'Rome Mediæval and Modern' in the *Encyclopædia Britannica.* Becker's *Gallus,* Lockhart's *Valerius,* Graham's *Neæra,* Westbury's *Acté,* and Wiseman's *Fabiola* are works of fiction dealing learnedly and attractively with Roman history and life.

RELIGION.—The religion of ancient Rome was in pedigree closely akin to the Greek, which accounts for the ease with which in later times the two religions became blended. Rome's earliest occupants, the Latins and the Sabines, had, like the Greeks themselves, a Pelasgic progeniture, and the greater number of her divinities were ultimately descended, through the Latin and Sabine, from Pelasgic originals. The Etruscan infusion into Roman nationality affected religion mainly on its external side, that of ceremonial. Among these Italian races—Latin, Sabine, Etruscan—religion took an Italian development, redolent of their racial and local characteristics, of which, as compared with the Greeks, lack of creative power was one; hence we miss in the Roman divine world that wealth of legend which makes the Greek so picturesque, while from the same cause the Roman divinities betray fewer of the failings by which those of Greece often sink to the human level. The Roman genius, with its practical and objective turn, determined the more observant spirit of its religious worship, which in its minute attention to detail, both in word and act, implied a graver, more reverential notion of deity. Sprung from shepherds and husbandmen of the simplest patriarchal type, the early Romans strike a rural and domestic note in their religion, worshipping especially the gods of nature, of field and forest, the bounteous protectors of flocks, or donors of harvests, like Faunus, Vertumnus, Saturn, Ops, and the gods who shielded the house and its inmates, gods of the family (Lares and Penates). This worship long retained in Rome the rural and household traits of its original inspiration, and far down in the history of the empire we find numerous festivities antique as to observance and yearly as to recurrence, in the Saturnalia, Lupercalia, and such like. Side by side with her agricultural, pastoral, and household divinities Rome from the earliest times continued to worship the deities who protected her civic life—state-deities, like her

founder and maintainer, Jupiter. With her political growth these came more and more to the front. After Jupiter, the head of the divine world, comes Mars, the defender of the city, father of Romulus and of the Roman people, and Quirinus, the deified Romulus. A second Rome-defending trinity was composed of Jupiter, with his sister and consort Juno and his daughter Minerva. Beside them in reverential honour was worshipped Vesta, goddess of the sacred fire and of the household hearth, which was the groundwork of the state. The deities just enumerated, especially the protective or tutelary deities, formed the main body of the state-religion of the Romans—a state-religion of which their second king, the Sabine Numa, was the revered founder and organiser. Of subordinate importance, but closely intertwined with public life and its concerns, came the worship of abstract, chiefly moral entities, embodied in the religious conception as Virtus, Fides, Pietas. Such deities gradually multiplied according to the appreciation or whim of individuals, till nearly every possible condition or influence, including the commonest occurrences and agencies, even accidental phenomena, were endowed with divine being, and worshipped accordingly. So we find Orbona, the averter of bereavement and bringer of comfort to its victims, Fessonia, the preserver from weariness, Quies, Febris, Abeona and Adeona (the goddesses invoked on departure and arrival). The natural world, the civic, the moral—the three elements above indicated—were the chief components of Rome's religion, and during her supremacy constituted a triune whole jealously guarded by the state from every foreign contamination. But with the spread of her dominion, particularly on her coming into closer contact with the Greeks in lower Italy, she imported into her religion extraneous, mostly Greek, objects and modes of worship. She came early to revere the oracular Apollo of Delphi, and (432) erected in Rome a temple in his honour as the plague-averting deity. Castor and Pollux were another acclimatisation, and her temple to them dates from 304. The worship of Æsculapius she took from Epidaurus (291). So long as her civilisation continued national Rome kept this foreign cult, though introduced and sanctioned by the state, as something separate from her old constitutional religion, which was thus maintained free from all corrupting or disintegrating infusion. Subsequently to the second Punic war, however—that turning-point in her civilisation—in an incredibly short time she became penetrated by Greek influences, and threw wide the door to the mythological traditions of Greece. She did indeed retain, for the most part, the names she had given her gods and the rites by which she worshipped them; but these were gradually undermined and overspread by Greek notions, until her literature, in so far as it dealt with religion, became impregnated with Greek legend and spirit. Nor was it Greece at her best that Rome followed in this subjection to her influence. Greece had long parted with her better traditions, and could convey little but what was sceptical and frivolous of her own or what was superstitious and fleshly of her eastern neighbours. Asia and Egypt, through the intermediation of Greece, and latterly at first hand, became the source of a sombre, sensual, degrading cult, which Rome, professedly at least attached to her healthier, more masculine worship, strove fruitlessly to countervail. Augustus did his best to prop up the declining religion through restoration of old usages and festivals, the rebuilding of temples on a more magnificent scale, and the discouragement of superstitious importations. Ovid made himself the poet of a similar inspiration in his *Fasti*, wherein he tried, by revivifying the old forgotten ceremonials, to reawaken the spirit from which these had sprung. Later emperors interposed from time to time in the same cause; but in vain. Religion and morals deteriorated with a rapidity that helps to explain the steady, irresistible advance of that religion of which Rome became the seat.

Preller's *Römische Mythologie;* Mommsen's *History of Rome;* Fustel de Coulanges, *La Cité Antique* (1864); Bouché-Leclercq, *Histoire de la Divination dans l'Antiquité* (4 vols. 1879–82); Roscher, *Ausführ. Lexikon der Griech. u. Röm. Mythologie;* and Gaston Boissier's *La Religion Romaine* should be consulted for fuller information, and the excellent article in the *Encyclopädie der Klass. Altertumskunde;* also Jean Reville, *La Religion á Rome sous les Sévères* (1886).

Rome, (1) capital of Floyd county, Georgia, on the Coosa River, 72 miles by rail NW. of Atlanta. It has iron-foundries, and manufactories of ploughs, nails, &c., and ships cotton. Pop. (1880) 3877; (1890) 6950.—(2) A city of New York, on the Mohawk River, 109 miles by rail WNW. of Albany, and at the junction of the Erie and Black River canals. It contains a number of mills and manufactories of iron, brass, copper, and other goods. Here is Fort Stanwix, which was successfully defended against St Leger, and 6 miles to the south-east the battle of Oriskany was fought, during the Revolution. Pop. (1875) 12,511; (1890) 14,991.

Rome, PRIX DE, the great prize given by the School of Fine Arts and the Conservatory in Paris, consists of a certain sum for four years, during which the recipient is expected to study painting at Rome and to lodge in the Villa Medici. The second prize is a gold medal.

Rome-scot, a name for Peter's-pence (q.v.).

Romford, a market-town of Essex, on the Bourne or Rom, 12 miles ENE. of London. It has large cattle and corn markets, iron-foundries, extensive market-gardens, and a very large brewery of 'Romford ale.' The church of St Edward the Confessor was rebuilt in 1850. Romford is the capital of the Liberty of Havering-atte-Bower, once part of the lands of the Saxon kings. Pop. (1851) 3861; (1891) 8408. See George Terry's *Memories of Old Romford* (1880).

Romilly, SIR SAMUEL, English lawyer and law reformer, was born son of a watchmaker of Huguenot descent, at London, March 1, 1757. At sixteen he was articled to one of the Chancery clerks, at twenty-one entered himself at Gray's Inn, and afterwards went the Midland Circuit, but found his chief employment in Chancery practice. In 1784 he made the acquaintance of Mirabeau, who introduced him to Lord Lansdowne; in 1790 he published an able pamphlet on the French Revolution. In 1806 he was, at the instance of Mr Fox, appointed Solicitor-general in the Grenville administration, and was compelled to accept the honour of knighthood. He took his seat for Queenborough, as in later parliaments for Horsham, Wareham, and

Arundel. He now devoted himself, by pamphlet and parliamentary agitation, to ameliorate the severity of the criminal law, which at that time inflicted Capital Punishment (q.v.) on over 200 different offences. His bills were session after session rejected, but Romilly nevertheless persevered, and, if he saw little fruit of his labours in his lifetime, made his name famous over Europe. He took an active part in the anti-slavery agitation, and in opposing the suspension of the Habeas Corpus Act, the spy system, and the despotic acts of the government. In July 1818 he was spontaneously chosen by the electors of Westminster as their representative. His wife died on the 29th October of that same year, and the shock so preyed upon his mind that three days after (November 2, 1818) he put an end to his life. See his *Speeches in Parliament* (2 vols. 1820), and his Autobiography (3 vols. 1840).—His second son, JOHN, BARON ROMILLY, born in 1802, was educated at Trinity College, Cambridge, and called to the bar at Gray's Inn in 1827. He was made Solicitor-general in 1848, Attorney-general in 1850, Master of the Rolls in 1851, and created a Baron in 1866. As Master of the Rolls Romilly incidentally rendered great services to his country, by superintending the publication of public records tending to throw much light upon English history and events. He died on December 23, 1874.

Romney, NEW, a municipal borough and Cinque Port in the south of Kent, 8 miles SW. of Hythe. It ceased to be a port in the days of Edward, and is not now either on the seashore or on a navigable river. Pop. (1881) 1007; (1891) 1306. Old Romney, a small village, is 1½ mile further inland. New Romney is the capital of the Romney Marsh district of fertile pastures, has a great sheep fair, and is connected with Lydd by a railway line 3 miles long. Of its five churches only one (St Nicholas) remains.

Romney, GEORGE, painter, was born at Beckside, near Dalton-in-Furness, Lancashire, on 15th December (o.s.) 1734. He was the second in a family of ten sons and one daughter, his father a clever carpenter and cabinet-maker; and after a very brief schooling he worked for ten years at his father's trade. Meanwhile he saw much of one Williamson, a watchmaker, philosopher, and alchemist; and meanwhile also he carved wood and drew. In 1755 he was articled to a 'Count' Steele at Kendal to be taught 'the art or science of a painter;' in 1756 married Mary Abbot of Kirkland; in 1757 set up as a portrait-painter on his own account; and in 1762 came up to London alone, leaving behind wife, boy, and baby girl—the last died a twelvemonth after. Of Romney's next thirty-five years there is little to record, beyond his two visits to France (1764; 1790) and his two years' residence in Italy (1773–75), after which, for twenty-two years, he lived in Cavendish Square. He slaved at his art, and his art so far rewarded him that Lord Thurlow said, 'Reynolds and Romney divide the Town: I am of the Romney faction,' and that in the single year 1786 he made by portrait-painting 3500 guineas. Of all his sitters the most celebrated is Lady Hamilton (q.v.), the 'divine lady,' so Romney called her. He painted her as 'St Cecilia,' as 'Joan of Arc,' as 'A Magdalene,' and in fully thirty other characters. The loveliest of them all, 'A Bacchante,' was lost at sea on its way back from Naples; but 'Sensibility,' sold originally for 100 guineas, fetched £3045 in 1890. Miss Sneyd as 'Serena' is another of his masterpieces, and so also is 'The Parson's Daughter' since 1879 in the National Gallery).

The thirty-five years went by, and at last, in 799, Romney returned to Kendal, to die there on 15th November 1802. *Finis!* No; the true *finis* is given by Edward FitzGerald: 'How touching is the close of Romney's life. He married at twenty-one, and, because Sir Joshua and others had said that marriage spoilt an artist, almost immediately left his wife in the north, and saw her but twice till the end of his life, when old, nearly mad, and quite desolate, he went back to her, and she received him, and nursed him till he died. This quiet act of hers is worth all Romney's pictures.'

See FitzGerald's *Letters* (p. 182); Lord Tennyson's 'Romney's Remorse;' Lives of the painter by Hayley (1809), and his son, the Rev. John Romney (1830); Hilda Gamlin's *Romney and his Art* (1894); Espinasse's *Lancashire Worthies* (1877); and Lord Ronald Gower's *Romney and Lawrence* ('Great Artists' series, 1882), with a catalogue by Algernon Graves of more than 300 of Romney's works, portraits mostly, but several also 'fancy subjects' for Boydell's Shakespeare Gallery, &c.

Romorantin, a town of France (dept. Loir-et-Cher), 45 miles by rail E. of Tours. Pop. 6714.

Romsdal, the valley of the impetuous Rauma in central Norway, which reaches the sea half-way between Bergen and Trondhjem. It is celebrated for its magnificent scenery; the mountains rise precipitously to 5000 feet—the Trolltinder or Witch Needles are 5880 feet high—the floor of the valley is strewn in places with gigantic blocks from mountain landslips; and cascades dash 3000 feet down the sides of the mountains.

Romsey, a municipal borough of Hampshire, on the Test, 8 miles NW. of Southampton. The fine cruciform abbey church, mainly Norman, but with Transition, Early English, and Decorated features, was the church once of a Benedictine nunnery, founded about 910 by Edward the Elder. Sir William Petty was the son of a Romsey clothier; and Lord Palmerston, of whom there is a bronze statue (1868) in the market-place, lived close by at Broadlands. A corn exchange was built in 1865, a town-hall in 1866. Pop. (1851) 2080; (1891) 4276. See Littlehales' *Romsey Abbey* (1886).

Romulus, legendary founder and first king of Rome, son by Mars of Rhea Silvia, the daughter of king Numitor of Alba Longa, was along with his twin-brother Remus exposed by their uncle Amulius, who had usurped Numitor's throne, but was suckled by a she-wolf, and brought up by the shepherd Faustulus and his wife Acca Laurentia. In 753 B.C. he founded his city on the Tiber, slew his brother, and invited for his citizens all homeless fugitives around, who carried off Sabine maidens for their wives. After Romulus had seen the Romans and Sabines united, and firmly established his city, he was carried up to the heavens in a chariot of fire (716 B.C.), and later worshipped as Quirinus.

Romulus Augustulus. See ODOACER; and ITALY, Vol. VI. p. 247.

Ronaldshay. See ORKNEY.

Roncesvalles. See ROLAND.

Ronciglione, a town of Central Italy, 30 miles NNW. of Rome. Pop. 5434.

Ronda, a Moorish town of Spain, stands on each side of a grand gorge through which flows the Guadiaro, and across which two bridges are stretched, one 255 feet from the water, 43 miles W. of Malaga. Pop. 19,181.

Rondeau (Fr.), a form of poem characterised by closely-knit rhymes and a refrain, and, as defined in the 17th century, consisting of thirteen lines, divided into three unequal strophes; the two or three first words of the first line serve as the burden, and recur after the eighth and thirteenth lines. It has been brought into vogue by Swinburne.

Rondo (Ital.), the most obvious and elementary form in music, in which the first subject, clearly marked out, followed by a second, more or less definite, recurs again in its original key. In later developments the repetition may take place twice, thrice, or even four times, sometimes in part only, or in modified form, the intervening sections being varied in different ways. A large proportion of songs and instrumental pieces are in this form; and the final movement of a sonata, symphony, or concerto is frequently a rondo.

Rondout, till 1872 a post-village of New York, with a pop. of 10,000; now part of Kingston (q.v.).

Ronge, JOHANN. See GERMAN CATHOLICS.

Ronsard, PIERRE DE, French poet, born at the Château de la Poissonnière in Vendôme, September 11, 1524, served the Dauphin and the Duc d'Orleans, and accompanied James V. with his bride, Marie de Lorraine, to Scotland, where he stayed three years. Becoming deaf, he abandoned arms for letters, and at the Collége Coqueret studied with Du Bellay and other members of the famous *Pléiade*. His *Odes* (1550) excited violent opposition from the older national school. In 1552 appeared his *Amours* and the fifth book of his *Odes*, his *Hymns* in 1555, in 1560 *Œuvres Complètes*, and in 1572, just after the St Bartholomew massacre, *La Françiade*, a fragment of an epic. Charles IX. heaped favours upon the lucky poet, who spent his later years in lettered ease at the Abbey of Croix-Val in Vendôme. He died at his priory of St Cosme at Tours, 27th Dec. 1585.

See editions by Blanchemain (1857-67) and Marty-Laveaux (1887-91); Sainte-Beuve's *Œuvres Choisies de Ronsard* (1828); and studies by Scheffler (1874), Chalandon (1875), Bizos (1891), and Piéri (1896).

Röntgen, WILHELM KONRAD VON, physicist, born 27th March 1845 at Lennep in Rhenish Prussia, studied at Zurich, and became professor at Strasburg, Giessen, and (1885) at Würzburg. He has contributed to science on specific heat in gases, elasticity, compressibility, capillarity, the absorption of heat in steam and gases, and especially the X-rays, usually called after him.

RÖNTGEN RAYS, a peculiar kind of radiation discovered in 1895 by Professor Röntgen, and produced, under suitable conditions, by electric discharge in VACUUM TUBES (q.v.). They pass, with comparatively little absorption, through wood, flesh, paper, and other optically opaque substances, but are strongly absorbed by such substances as metals, bone, and glass. In a general way the 'transparency' of matter to these peculiar rays decreases as the density increases. Their presence is detected by their power of producing luminescence in certain fluorescent substances, such as the platino-cyanide of barium, sodium, or potassium (PHOSPHORESCENCE). A screen covered with a layer of these fluorescing crystals becomes brightly luminescent in the neighbourhood of a vacuum tube which is giving out Röntgen rays. When a slab of wood or vulcanite is interposed between the vacuum tube and the screen, the screen still continues to glow. An arm interposed casts upon the screen a shadow in which the dark central bony structure can be clearly distinguished from the lighter flesh shadows. These shadow-pictures may also be photographed on a sensitive photographic film or plate, and a permanent record secured—an application of immense service to surgery.

It should be noted that there is nothing really extraordinary in optically opaque matter being transparent to other kinds of rays. A similar group of phenomena is met with in the opacity of glass, and the transparency (or diathermancy) of rock-salt to the dark heat-rays, although optically both are transparent. Moreover, in their power of exciting fluorescent substances and in affecting the photographic plate the Röntgen rays may be compared to the actinic or ultra-violet rays. They have also the property of discharging electrified bodies, a property possessed under certain conditions by violet light. But in almost all other respects the Röntgen rays differ markedly from the recognised forms of ether radiation. They cannot be reflected or refracted; they suffer no diffraction; they have not yet been polarised.

As to their nature, many views have been advanced. The hypothesis which appears to be most satisfactory is that enunciated by Sir George Stokes, who regards the Röntgen rays as a succession of impulses communicated to the ether in an irregular or fitful manner. He gives reasons for believing that the behaviour of ordinary rays of radiant energy, when refracted, reflected, or diffracted, depends upon the fact that they are composed of trains of waves periodically associated. However this may be—and the question is one of extreme difficulty—there is no doubt that, in the impacts of rapidly moving particles on the glass walls of the vacuum tube, we have conditions favourable for the production of the impulses imagined by Stokes. There is strong evidence that such a bombardment is going on. For a particular condition of vacuum in a Crookes tube, there appears to be projected from the negative electrode a bright beam of rays, the so-called kathode rays. At a somewhat higher vacuum these rays cease to be visible as a stream of Crookes' 'radiant matter;' but their presence is indicated by the phosphorescence produced on the glass walls. By suitable contrivances the kathode rays can be focussed on a definite part of the containing glass wall; and it is there that Röntgen rays are produced in quantity.

In 1894 Philipp von Lenard (an Austrian pupil of Hertz, and from 1896 professor at Heidelberg), following out a suggestion by Hertz, observed what seemed to be a passing of the kathode rays through a thin piece of aluminium which formed part of the containing wall of the vacuum tube. These *Lenard rays*, in their phosphorescing effects and in their sensitiveness to an approaching magnet, have an undoubted resemblance to the kathode rays. There is no evidence, however, that the kathode rays have really passed through the metal disc. It is possible that their bombardment of the disc on the one side may produce electrical changes capable of starting similar rays on the other. This is the explanation given by Professor J. J. Thomson, whose measurement of the speed of the kathode rays quite disproves the contention (based largely on Lenard's observation) that the kathode rays are ether vibrations. This speed was found to be about one or two hundred miles per second—that is, about $\frac{1}{1000}$th the speed of light. It was when studying the properties of the kathode and Lenard rays, which seem to differ only in their mode of production, that Röntgen discovered what he himself called the *X*-rays. A large and increasing literature is now devoted to the discussion of their properties and applications.

Rood (a form of the word *rod*) is used of the Cross of Christ, the Holy Rood, and of crosses and crucifixes generally, but especially the great crucifix which in mediæval churches stood on the rood-screen (see SCREEN). As a measure of surface, a rood is the fourth part of an acre, and contains 40 square poles or perches, or 1210 square yards. The square rod or rood used in estimating masonwork is equal to 272¼ square feet.

Roof. In warm countries, such as India, flat roofs, covered with cement, are usual. Those of Palestine, Egypt, and Assyria also were flat, and were composed of wooden beams covered with thick layers of earth.

In milder and rainier climates, roofs sloping from a central ridge are the ordinary form. Great Greek

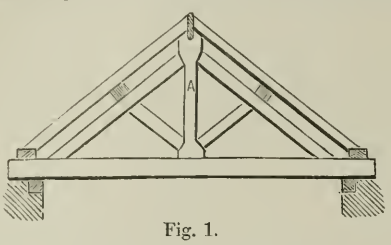

Fig. 1.

buildings were covered with marble slabs, carefully grooved together; in common Greek and Italian buildings roofing tiles are used. In the rainy climate north of the Alps steeper roofs are needed to throw off rain and snow.

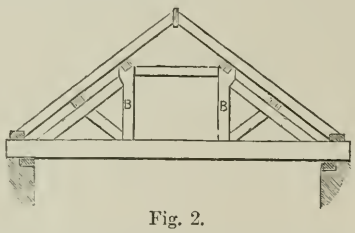

Fig. 2.

Roofs well constructed serve to bind the walls together and strengthen the building; if too heavy they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in 'principals' or 'trusses.' Fig. 1 represents a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is used for wider spans, and leaves the centre clear for attics. Early Christian basilicas (and probably the Roman basilicas) had such roofs. In the early Gothic style the king-post was carved and the tie-beam moulded. The Decorated style introduced an arch or a series of cants (fig. 3). As the style progressed curved braces were placed under the tie-beam, to support it; these were carved, and rested on elegant corbels, the spandrels between

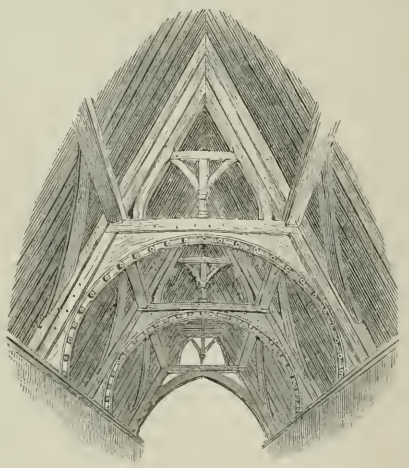

Fig. 3.

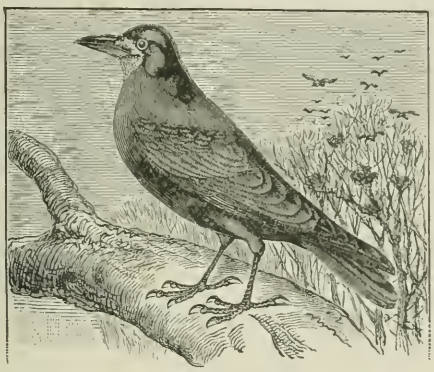
the braces and the wall being filled with tracery. In the Perpendicular style the central part of the tie-beam is cut away, and the beautiful hammer-beam roofs of the period become usual (see fig. 4). The roof of Westminster Hall is one of the finest examples of this kind of roof. These open timber-roofs are much used in England both in churches and halls, but abroad chiefly in the latter, as the church roofs were more frequently vaulted. In

Fig. 4.

modern times, when great spans have to be roofed over, combinations similar to those used in lattice Bridges (q.v.) are required. Iron has been introduced, and by means of it, spaces of almost any width can be roofed over. See also CEILING, MANSARD ROOF, FAN-TRACERY, &c.

Rook (*Corvus frugilegus*), a species of Crow, common in Britain and in many parts of Europe and Asia, especially in northern and central regions. In late autumn there is a migration from the Continent to the eastern shores of Britain, and a return in early spring. Some of the characters of the rook have been contrasted with those of other species of Corvus in the article CROW. The plumage is bluish black; the forehead, cheeks, and throat are bare; the bill, legs, and feet are black. White and piebald spots sometimes occur. The rook does not breed till it is about two years old. The nest, built of twigs with a lining of grass and roots, is almost always on a lofty tree. The noisy cawing of the builders in March is one of the familiar signs of departing winter. The eggs (three to five) are bluish green with olive-brown markings. As to food, the rook is almost omnivorous, but it depends in great part on insects and grubs. Unlike the crow, the rook is characteristically a social bird, feeding in great flocks, nesting in rookeries, and sometimes combining to beat off a common foe. Confident perhaps in their numerical strength, and reliant on their habit of posting sentinels, rooks are by no means shy, for they sometimes nest in the trees of a town garden, and, though much afraid of a gun, soon grow accustomed to scarecrows and noise. They are very wide-awake birds, exhibiting no small degree of that acuteness which is often displayed by gregarious birds and beasts. They show sagacity in choosing fit trees on which to nest, in posting sentinels who warn the others when danger threatens, and in distinguishing real from fictitious sources of alarm. Though quarrelling and mutual robbery are common during the nest-building, there is no doubt that rooks have a sort of social feeling, which manifests itself sometimes in the punishment which they inflict on an offending member. The same rooks seem to take possession of their old nests year after year, repairing the damage done by the winter storms. The male rook feeds the

female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones, and the nestlings are provided with little stones essential to the grinding of the food in the gizzard. The rook can be tamed, and may exhibit something of the imitative power possessed by several related birds. While rooks are useful in so far as they destroy



Rook (*Corvus frugilegus*).

many injurious insects and grubs, they sometimes damage trees by breaking off the twigs, they root up grass and young corn, and do other damage to the crops. In moderate numbers they are useful, but in multitudes they are compelled to leave their natural food and become injurious.

Rooke, Sir George, British admiral, was born in 1650, near Canterbury, at the country-seat of his father, Sir William Rooke. Entering the navy, he found himself at thirty a post-captain, and in 1689 was promoted to the rank of rear-admiral of the red. He took part in the action off Beachy Head between the Earl of Torrington and a French fleet under Tourville; and in 1692 he distinguished himself greatly in the memorable battle off Cape La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell. For this he received the rank of vice-admiral of the red, knighthood, and a pension of £1000 a year. In 1702 he commanded the expedition against Cadiz, and destroyed the Plate-fleet in the port of Vigo. In conjunction with Sir Cloudesley Shovel he accomplished the capture of Gibraltar, 21st July 1704. On the 9th August of the same year he engaged off Malaga a much heavier French fleet under the Comte de Toulouse, and fought one of the bloodiest of naval battles, the honours of which fairly remained with the English, though the escape of the enemy's fleet through the hazy weather rendered it a somewhat barren triumph. The struggle lasted through nearly a whole day; the French loss was upwards of 3000, the English upwards of 2000 men. Sir George was received with marked distinction by Queen Anne, but, finding the government hostile to him on political grounds, retired, and led the life of a Kentish gentleman till his death, 24th January 1709. See his *Journal*, edited by Oscar Browning for the Navy Records Society (1897).

Roon, Albrecht Theodor Emil, Count von, Prussian soldier, was born at Pleushagen near Kolberg in Pomerania on 30th April 1803, entered the army in 1821, was appointed in 1827 to teach in the cadet school of Berlin, and joined the general staff in 1833. He held amongst other positions that of topographer in the general staff surveys (1833–35), teacher in the military academy (1835), military tutor to Prince Frederick-Charles (1843), and member of the commission for reorganising the Prussian army (1859). In the last-quoted year he was made war minister, and in 1861 marine minister as well. He carried the bill for army reform through the House of Representatives; the effects of his labours in reorganising the army were brilliantly realised in the great wars of 1866 and 1870–71. His rewards included the title of count (1871) and the rank of field-marshal (1873). For a few months before his retirement (November 1873) he acted as president of the Prussian cabinet. He died in Berlin on 23d February 1879. A pupil of Karl Ritter (q.v.), Von Roon illustrated his teacher's methods in an elementary work on general geography (12th ed. 1868) and in a more advanced book dealing with general geography, ethnology, and politics (3d ed. 1847–55). See Life by Von Gossler (1879), an anonymous Life (Gütersloh, 1888), and *Deutsche Revue* (1890–91).

Root. The exact use of the term in botany is not quite fixed. Old usage restricted it to the roots of seed plants, the organs of other plants which have the same general functions receiving various names; thus the roots of cryptogams were called rhizoids. The formal definition of root then used to be a part of a plant which produces no leaves, which has its growing-point protected by a root-cap, and which is developed endogenously—from the inner and not from the outer tissues. But it is more satisfactory to use the word in its physiological rather than in its strictly morphological sense, and to describe as roots all those parts of plants which (1) absorb nourishment from the soil or from water and not from the air, (2) fix the plant to the earth, (3) and grow, as a rule, *downwards* into the earth, and away from the light, not *upwards*, and towards the light, as 'shoots' do. Thus not only the complex roots of the seed plants, but also the rhizoids of cryptogams and the mycelia of fungi are called roots, in contradistinction to all those parts of plants which grow upwards towards the light, and which produce reproductive organs, which may conveniently be called shoots. But it is distinctly to be understood that organs of the same kind, from the morphological point of view, may have different forms and different functions; thus shoots may function as roots, and roots may grow up into the air as shoots. Further information as to the physiology of roots will be found in the article upon Vegetable Physiology; in this article it is chiefly the morphology of roots that will be dealt with.

As the leaf surface of a seed plant is developed the root system grows; in a large sunflower it occupies about one cubic yard, in a large tree hundreds of cubic yards. This system, resulting from the branching of the primary, secondary, and other roots, the ultimate divisions consisting of root-hairs, is so complete that scarcely the space of a quarter cubic inch is unoccupied. Abundance of water, to balance the transpiration, and of salts, for other purposes of plant-life, is thus secured. The root system of aquatic plants is small, water being easily obtained and transpiration slight.

All roots at first are thin hair-like organs; the greater thickness that those of the dicotyledons attain is due to a secondary growth. The thickened roots serve only as organs of attachment, and of course as conducting channels, but not at all as organs of absorption. These absorbing parts, root-hairs, are protuberances of the outer layer of cells of the roots. They arise shortly behind the growing tip, and they die off in a few days, so that only an inch or two of root bears root-hairs. In this way the root-hairs are continually brought into contact with portions of untouched soil.

A longitudinal section near the apex of a root of a seed plant shows the following arrangement of

parts. Near the apex is the growing-point, a mass of actively dividing cells, called the primary meristem; by division these give rise to, below, several layers of simple cells (the root-cap), above, the main mass of the root, which, immediately above the primary meristem, consists merely of simple 'meristem' cells. A little higher up the meristem differentiates into three layers—the dermatogen, the periblem, and the plerome. These undergo further differentiation, so that a mature root consists of the following parts: (1) an outer layer, the epidermis, developed from the dermatogen; (2) several layers of simple cells, the cortex, developed from the periblem; (3) the fibro-vascular cylinder, an innermost mass of simple cells, and the pith, both developed from the plerome. The root-cap serves as a protection to the delicate growing-point of the root as it forces its way through the soil. It is continuously worn away by the particles of the soil, and as continuously reformed by the primary meristem cells. The epidermis binds the whole together, and many of its cells develop into long hairs, the absorbing root-hairs already mentioned. The cortex has no special function. The bundle sheath, when it occurs, separates the cortex sharply from the rest of the root. The fibro-vascular cylinder is the part of the root that acts as the channel for the ascending water and salts (crude sap), and gives it also its strength as an organ of attachment. The cylinder consists of smaller bundles of wood vessels and of bast fibres arranged alternately. The centre of a young root is occupied by pith.

Secondary thickening may occur in roots as in stems, and is due to the formation of a layer of actively dividing cells, the cambium. The bundles of wood and bast are placed alternately in a cylinder, and the cambium ring seen in transverse section waves in and out so that it passes inside the bast bundles and outside the wood bundles. The result of this is that the secondary thickening of roots results in a mass of tissue similar to that formed by secondary thickening of stems (see STEM). Thickened roots usually lose their original cortex and epidermis and gain a fresh covering in the following way. A layer of tissue, the root-sheath or endodermis, is differentiated which envelops the fibro-vascular cylinder; within this lies a layer of parenchyma, simple tissue; it is called the pericambium or phellogen. This layer gives rise to the new covering, which consists of two parts, phelloderm and periderm (which is of cork), corresponding to the original cortex and epidermis.

Forms of Roots of Seed Plants.—The primary root is merely the enlarged radicle of the seedling; it is the direct prolongation of the stem. All secondary roots arise from this first root; the secondary roots may give rise to others and so on until the common much-branched root is formed. If the primary root is very thin the whole system is called a fasciculated root; if the secondary fibres are also very fine it is called a fibrous root (e.g. the grasses); if the fibres are very much thickened it is said to be a tuberous root (e.g. the dahlia). When the primary root is much thicker than the secondary roots it is called a tap-root, and may be further classified according to its shape, as spindle-shaped (e.g. the carrot) or turnip-shaped. Much-thickened roots are usually storehouses of food material—e.g. the fasciculated root of the Turk's cap, lily, or the tap-root of the turnip. Roots are also described as fleshy (e.g. the beet-root), or as woody (e.g. the roots of trees). Fleshy roots usually die in the autumn; woody roots may live for many years, even when the shoots die down every autumn. Roots are usually buried in the soil, but they may be aerial, as for instance the roots of climbing plants such as ivy; these arise from the stem and fix the plants to their supports. In the tropics many plants have aerial roots; thus the mangrove forms forests in the swamps. The Indian fig has aerial roots from which, after they have become fixed in the ground, new plants may spring. Orchids are examples of the Epiphytes, which have aerial roots which merely fix the plants to trees but do not derive any nourishment from them. Aquatic plants often have roots which do not penetrate into the mud but float freely in the water. Many plants will form new roots after all the old ones have been cut off if they are placed in water or in a damp soil. This is taken advantage of by gardeners in their method of propagating such plants as fuchsias, oleanders, &c. from cuttings.

Esculent roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant, and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the Tubers (q.v.), Bulbs (q.v.), and Corms (q.v.), are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order Cruciferæ, as the turnip and others of the genus Brassica—some of the order Chenopodiaceæ, as beet and mangold wurzel—some of the order Umbelliferæ, as the carrot, parsnip, &c.—and some of the order Leguminosæ.

Comparative.—Most of the Thallophytes (Algæ, Fungi, and Lichens) have only a rudimentary differentiation into stem, leaf, and root, or none at all; but the most highly developed members of each division have an outward distinction of parts to which such terms may be given; still the roots even of these are distinguishable from the roots of vascular plants by the absence of a root-cap, and by their branching, which is never endogenous.

The Vascular Cryptogams—ferns, horsetails, lycopods, &c.—are highly differentiated in form and in their tissues. The roots arise in acropetal succession on the stem, or in many ferns on the petioles; their branching is monopial or dichotomous; they are all alike—the first root never becomes like a tap-root, the lateral roots arise from the innermost layer of the cortex. The roots grow by successive divisions of an apical cell. The Selaginellæ, a group of the Lycopodineæ, are remarkable for having true roots, but a few have no root-caps on them. The growing-point too is formed by a primary meristem and not by an apical cell.

The roots of the Seed Plants, consisting of Gymnosperms—i.e. Cycadeæ, Coniferæ, Taxaceæ, and Gnetaceæ, and of Angiosperms—i.e. Monocotyledons and Dicotyledons, have already received a general description: a few points of comparison may here be repeated. The primary root is a continuation of the primary stem; it is directed towards the micropyle of the embryo-sac (see OVULE), and even it is of endogenous origin, its first rudiment being covered by the nearest cell of the suspensor. All the parts of the seed plants, shoots and leaves as well as roots, are distinguished from the parts of all other plants, except the Lycopodiaceæ, and for a short time the embryos of some Coniferæ, by having a small-celled primary meristem at the growing apices instead of the typical apical cell of many Algæ, and of the Muscineæ, Ferns, and Horsetails. The root-cap is formed, not as in the cryptogams, by transverse divisions of an apical cell, but by rapid division in the direction of the apex, and in gymnosperms from the periblem, in angiosperms from the dermatogen. Also the first rudiments of lateral roots, shoots, and leaves do not arise from single cells, as in the cryptogams, but from protuberances of a few small cells. The formation of a closed cambium ring in

the primary and stronger lateral roots, and the subsequent secondary increase in thickness, is a characteristic of gymnosperms and dicotyledons, and does not occur in the cryptogams. This habit often results in the formation of persistent root systems, which in the monocotyledons are often replaced functionally by rhizomes, tubers, and bulbs.

The stems of the Cycadeæ are not unlike those of the Tree-ferns, but unlike them they have tap-roots; secondary roots appear above ground. In the Coniferæ the endosperm bursts the seed-coat at the root end, and the root, which develops a strong tap-root with lateral members, is thrust out.

The primary root of monocotyledons soon ceases to grow, lateral roots spring from the axis, each new root springs from a point higher up the stem, and being stronger than the older ones, there is no secondary thickening and no persistent root system. Some saprophytic monocotyledons form no roots at all. In dicotyledons an axis below the cotyledons is called the radicle, but the upper and often the larger portion consists of a part of the stem called the hypocotyl; the lower part is the true embryo root. The root is the first part to issue from the burst seed-coat; it grows and gives rise to lateral roots. If the primary stem grows vigorously the primary root also grows rapidly and forms a tap-root. If the growth ceases adventitious roots are often formed between the former lateral ones, which may themselves give rise to lateral roots. For further information, see Sachs's *Physiology of Plants* (1887) and Goebel's *Classification and Morphology of Plants* (1887).

Root-stock or *Rhizome* is the name given to an underground stem when its shape is cylindrical; to a creeping stem, in short. It is easily distinguished from a root by the fact that it ends in a bud, and bears leaves or scales. It gives off roots every here and there. In the autumn the aerial leaves die down, but the rhizome lives through the winter, and in the spring its terminal bud goes on growing. Rhizomes are usually by the autumn well stored with reserve food-matter for the use of the bud in the following spring. Examples: the anemone, the lily of the valley, the yellow iris, many ferns.

Root, in Algebra, denotes any value of the unknown quantity in an equation which will render both sides of it identical (see Equations, Involution). The *square* root is that number which, multiplied by itself, produces the given number; the *cube* root, the number which, multiplied into itself and then into the product, produces the given cube; so with fourth root, fifth root, &c. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of Algebra.

Root, George Frederick, an American composer, was born at Sheffield, Massachusetts, 30th August 1820, taught music in Boston and New York, studied a year in Paris, and returned to write numerous songs that became widely popular. Among them are 'Rosalie, the Prairie Flower,' 'There's Music in the Air,' and, during the civil war, 'The Battle-cry of Freedom,' 'Just before the Battle, Mother,' and 'Tramp, tramp, tramp, the Boys are marching.' His greater efforts, including a Te Deum, are less known. He died on the 6th of August 1895.

Root and Branch Men, a party in the Commons and out of it who supported a petition signed by 15,000 London citizens, praying that episcopacy might be destroyed 'root and branch.' Nathaniel Fiennes, Sir Harry Vane, and Hampden were of the party. A bill to give effect to the petition was read a first and a second time in 1641, but was ultimately dropped.

Root-parasites, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the Broom-rapes (Orobancheæ, q.v.), species of Thesium, &c., and the Rafflesias (q.v.), with other Rhizantheæ (q.v.).

Ropes. The staple fibre for ropes has long been Hemp (q.v.), but since the middle of the 19th century several other fibres have come largely into use. Hemp is better suited for cordage (the general term for ropes, cords, and twine of all kinds) than for weaving purposes, because it gives way when much folded into sharp folds more readily than other important textile fibres—flax, for example. Manilla hemp (*Musa textilis:* see Abaca), belonging to a quite different order of plants from the common hemp, makes the strongest ropes now manufactured, and is largely employed. Coir fibre, from the husk of the cocoa-nut, is another important rope-making material which, though long used in India, has in Europe only taken its place as a valuable cordage fibre in comparatively recent years. It is fairly strong, and, size for size, it has the advantage of being considerably lighter than either hemp or manilla. Unlike these, coir rope is never tarred for preservation. Sisal hemp, from the *Agave sisalana* of South America, though not nearly so strong as common hemp, is also much used, especially for ropes of small size. For certain purposes, such as driving parts of textile machinery, cotton ropes are largely employed. There are only two other rope fibres which as yet can be said to be of any importance in Britain—viz. the Sunn hemp (*Crotalaria juncea*) of India and the *Phormium tenax* of New Zealand. A large number of plants valuable for cordage grow in India, for a list of which, as well as for an account of the native process of rope-spinning, see Balfour's *Cyclopædia of India.*

As regards the strength of ropes, it will be readily understood that in this respect specimens of the same kind of vegetable fibre will vary considerably. Healthy plants will yield a better fibre than those of more feeble growth, and some supplies of the same kind of material will have been more carefully prepared for spinning than others. The amount of care and skill bestowed upon the spinning process itself will also vary in the case of different manufacturers. Tarred ropes, again, though more durable, are not so strong as when left untarred; and as tar is liable to be impure it will happen that it weakens or injures the fibre more at one time than at another. These matters will partially explain why an unexpected difference not unfrequently occurs in the strength of two similar ropes which might be supposed to be equally strong. In the valuable work by W. G. Kirkaldy on his father's *System of Mechanical Testing* (1891) he gives the breaking stress of a large number of tested ropes, and in his remarks on this section of his experiments points out that the strength of some of these is much lower than it ought to be. He thinks that this can only be accounted for by adulteration of the fibre. It is probable that jute is sometimes mixed with better material. In one instance he found some rubbish called 'batch' hidden inside the rope. The following examples will show approximately the comparative strength of ropes made of three different materials. They are taken from a table in Mr Kirkaldy's work giving the results of the testing of seventy specimens of ropes.

	Circumference.	Breaking or Ultimate Stress.
Common hemp, untarred	2·56 in.	4840 lb.
Hemp, tarred	2·69 "	4263 "
Manilla	2·62 "	7044 "
Cotton	2·48 "	3089 "

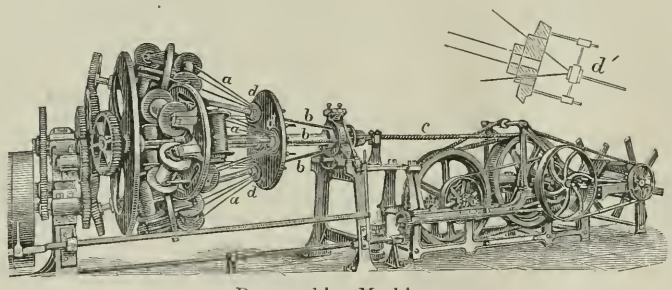
In these instances the strength of the untarred hemp rope is below and that of the manilla rope

is above the average. Mr Kirkaldy states that the calculated 'stress per fathom-weight,' by a method akin to calculating the tensile strength per square inch of metals from actual tests, gives a more useful basis to compare the value of ropes than the breaking stress does. This stress per fathom-weight in each of the above examples was: hemp, untarred, 3457 lb.; hemp, tarred, 2631 lb.; manilla, 6905 lb.; cotton, 2860 lb.

Ropewalk Spinning.—Notwithstanding the successful application of machinery to the manufacture of ropes, the old process of ropewalk spinning is still practised on a considerable scale. The successive stages in the process are (1) heckling the fibre; (2) spinning the yarn; (3) tarring in 'hauls' consisting of about 300 yarns, laid close and parallel in lengths of say 100 yards; (4) winding the yarn on bobbins and mounting these on bobbin-frames; (5) forming the strands; and (6) laying the strands into a rope. The heckling of hemp is done in the same way as the heckling of flax (see LINEN), the object being to remove the tow or short fibres and to place the long fibres called 'line' parallel to each other. Spinning in this process is done by hand, but either an iron whirl-hook, forming the spindle of a small pulley, or, what is of more recent introduction, a similar hook with a small cone upon it, is kept in motion for the spinner. Several of the former are mounted on a circular frame, and driven by hand or power; but a set of the latter, which automatically fall out of gear by weights when the spinning is interrupted, are arranged in a straight line, because they are driven by the friction of larger cones fixed on a shaft, and there may be twelve of either kind of hooks forming a set. The spinner wraps a quantity of the heckled hemp round his waist, and attaches some of the fibres to one of the hooks, which by its revolving motion twists them as he continues to pull out and regulate the supply of fibres with one hand, and press them into proper form with the fingers of the other. He carries in his right hand a piece of woollen cloth, with which he grasps the fibres, and walks backwards, while he spins, to the farther end of the long covered walk.

The hauls of yarn are tarred by passing them through Archangel tar, heated to 240° F., a nipping apparatus being used to regulate the quantity taken up by the fibre. The next step is to wind the yarn on bobbins, which are then placed on a vertical frame. In order to form a strand of say ten yarns, one from each of ten bobbins is drawn through as many holes in a metal disc or register-plate, and immediately afterwards brought together and formed into a compact bundle of yarns by passing them through a stranding tube. On emerging from this the strand is fastened to the rotating hook of a forming machine on a travelling carriage, which, by means of proper gearing, is drawn along the walk, giving at the same time the proper twist to the strand. In this way three or more strands are formed at the same time by the machine. These are then laid into a three-stranded rope or 'hawser' by attaching them at one end to the centre hook of the machine, while the other extremities of the strands are attached to three hooks. At that end where they are hung together on one hook the three strands are kept equidistant by placing them into the three longitudinal grooves of a conical piece of wood, called a 'top.' The twisting of the strands is effected by the rotation of the hook, from which the top recedes as the rope is formed. As the twist of the laying is in the opposite direction to the twist of the strands, the single hook requires to be turned in a contrary direction to the other three. A hawser has either three or four strands, the latter being said to be 'shroud hawser laid.' It requires a core-piece, and is much used for trawling. A Cable (q.v.) is a thick rope with usually nine, sometimes twelve strands.

Rope-making by Machinery.—By this is understood the making of ropes by machines which do their work without the necessity of having a ropewalk. The heckling, the drawing, and the spinning frames for preparing rope yarns are the same in principle as the corresponding machines used for spinning linen yarn for weaving purposes. There is, however, some difference in detail, owing to the greater average weight of rope yarn, so that, for example, there are comparatively few bobbins on the spinning-frame proper. Separate machines are perhaps more generally used for making strands and for laying these into ropes than compound machines which perform both operations, especially for very thick ropes. All these are now made of different designs, and with a good deal of variety in their details. The annexed figure of Glover & Guiltinane's patent compound rope machine will give a fair idea of one of the newest forms of this kind of apparatus. It is constructed to make three-strand ropes up to 3½ inches in diameter, there being in the one here figured six bobbins for each strand. It is furnished with change wheels, to enable either hard or soft laid ropes to be made. From a fuller description in *The Engineer* (7th March 1890) we extract the following: 'The yarns being wound round on the bobbins in suitable numbers, according to the size of the rope to be made, they are from each bobbin threaded through a head-runner (register-plate) of six holes, and gathered at a die, at which they are closed into strands, there being a separate die for each of the three strands. The strands being formed, they are then threaded through a main head-runner of the holes, and immediately closed at the main closing die into finished rope. The rope is drawn through the die by means of strong hauling-off drums, and ultimately wound on a storage creel.'—Wire-ropes (q.v.) and textile fibre ropes are now largely employed for driving machinery instead of belting.



Rope-making Machine:
a, yarns; *b*, strands; *c*, laid rope; *d*, head-runners or register-plates; *d′*, section of head-runner.

Roque (Lat. *Rochus*), ST, the patron saint of those sick of the plague, and the enemy of cattle-plague. He was born in Montpellier, about 1295, devoted himself to the care of persons suffering from the plague, especially in Italy, and died in 1327.

Roquefort, a village in the French department of Aveyron, situated on the western edge of the Causses plateau, 44 miles N. by W. of Béziers and 10 SW. of Millau, and celebrated since Roman times for its ewe-milk cheeses. Pop. 973.

Roraima, an isolated, table-topped sandstone mountain, near the west border of British Guiana. First sloping gradually upwards 5000 feet above sea-level (2500 above the plain on which it stands), it next shoots up 2000 feet more in a perpendicular stupendous cliff, over which drop numerous waterfalls. It was first scaled by E. F. im Thurn on 18th December 1884.

Rorke's Drift, a station on the Tugela River, Zululand, South Africa, memorable for the heroic defence of Lieutenants Chard and Bromhead, with eighty men of the 24th Regiment, who had been left to guard the commissariat stores and the hospital of Lord Chelmsford's force, against 4000 Zulu warriors during the night of the 22–23d January 1879, the night after Isandula. The only defences of the British were an extemporised rampart of rice bags and biscuit boxes, yet they kept the enemy at bay, and six times in succession drove out parties who had got within the barricade.

Rorqual (*Balænoptera*), a kind of baleen whale, to which the names of *Fin-back*, *Finner*, and *Razor-back* are also applied. The genus includes the largest and some of the commonest whales, and is represented in all seas. The head is flat and pointed, the body is slender, the skin of the throat is deeply folded in longitudinal plaits, the whalebone is short and coarse, and there is not much blubber. The 'blue whale' (*B. sibbaldii*), the largest living animal, may attain a length of 80 or 85 feet. It seems to pass the winter in the open sea, and approaches the coast of Norway at the end of April or beginning of May, and is sometimes stranded on British coasts—for instance, in the Firth of Forth. The Common Rorqual (*B. musculus*) attains a length of 60 to 75 feet, and it often comes ashore on British coasts. Rudolphi's Whale, or Northern Rorqual (*B. borealis*), does not exceed

Northern Rorqual (*Balænoptera borealis*).

50 feet in length; and yet smaller is the Lesser Rorqual (*B. rostrata*), which measures about 30 feet. The former is not uncommon in the more northern seas, while the range of the latter extends from the Mediterranean to Davis Straits. The rorquals seem to feed on small crustaceans, and sometimes on small fishes. Though not nearly so valuable as species of Balæna, they are often captured by the whalers. See WHALE.

Rosa, CARL, whose real surname was ROSE, impresario, was born at Hamburg on 22d March 1843, and studied music at Leipzig and Paris. After conducting a concert and operatic tour in the United States in 1871–72, he came to England, his intention being to produce standard operas with an English text. But it was 1875 before he was able to carry out his intention. London gave him little encouragement; the prejudice against English opera was too strong. The provinces, however, welcomed the new undertaking and made it successful. Carl Rosa may be called the father of English opera in two senses: he not only produced the great operas of German, French, and Italian composers with English texts, but he encouraged native composers to write opera, by giving them commissions for works. It was in this way that such operas as Goring Thomas' *Esmeralda* and *Nadeshda*, Dr A. C. Mackenzie's *Colomba* and *Troubadour*, Dr V. Stanford's *Canterbury Pilgrims*, and others came to be written. Carl Rosa died on 30th April 1889.

Rosa, MONTE. See MONTE ROSA.

Rosa, SALVATOR, was born at Arenella, in the neighbourhood of Naples, on 20th June (or 21st July) 1615. In his youth he got a little instruction from Falcone, a painter of battle-scenes, but spent most of his time wandering amongst the wild and romantic scenery of Southern Italy, copying from nature. Some of his landscapes attracted the notice of the painter Lanfranco, who encouraged the young artist to go to Rome (1635). The next three years he passed alternately in Naples and in Rome, and leaped into fame with a picture, 'Tityus tortured by the Vulture.' He then settled down in Rome, but seems to have been in Naples at the time of Masaniello's revolt (1647), though it is uncertain whether he bore arms in support of the Fisher Lad. (It seems not to be true that he lived with bandits in the mountains in his youth.) At Rome his social talents—he was a skilful musician, improvisatore, actor, and poet—his merry humour, his wit, and his princely generosity made him a great favourite. But he made powerful enemies by his satires, clever productions in verse, and withdrew to Florence, where he remained nearly nine years. After that he returned to Rome, and died there on March 15, 1673. Salvator has a great reputation as a painter; this he owes mainly to his landscapes, which, though in many respects faulty, are original in subject and treatment, being generally representations of wild and savage scenes, executed with considerable freedom and energy. His historical pictures are not so good, though they are those he himself thought most of. He executed numerous etchings, highly characteristic of his peculiar style. His *Satires* were published in 1719. See Life by Baldinucci (new ed. 1830) and by Cantu (1844). Lady Morgan's book (1824) is a blending of fact and romance.

Rosacea. See ACNE.

Rosaceæ, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty and fruit. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphrodite, but sometimes unisexual; the inflorescence various. The calyx is 4 to 5 lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx; the ovary is sometimes solitary, sometimes there are several ovaries, each one-celled, with a lateral style, or a number of ovaries are united into a many-celled pistil; the ovules generally two or more. The fruit is sometimes a drupe: sometimes a pome; sometimes follicular; sometimes a nut; sometimes a collection of nuts enclosed in the fleshy tube of the calyx; sometimes a collection of small drupes forming a head, as in the raspberry; and sometimes, as in the straw-

berry, it is an enlarged fleshy receptacle with the seeds imbedded on its surface. This natural order contains at least 1000 known species; but in some of the genera, as Rosa and Rubus, the determination of the species is attended with great difficulty, and varieties—sometimes reckoned species—are numerous. The order, as generally received, is divided into a number of sub-orders, several of which have by some botanists been elevated to the rank of distinct orders, as Amygdaleæ, Pomaceæ, Sanguisorbeæ. See also Rose, Rubus, Strawberry, Potentilla, Tormentil, Agrimony, Geum, Spiræa, Cusso, &c.

Rosamond. Fair. See Clifford.

Rosaniline. See Dyeing.

Rosario, the third city of the Argentine Republic, and the largest in Santa Fé, is on the west bank of the Paraná, 190 miles by rail NW. of Buenos Ayres, 210 miles by river. It has an excellent harbour, and carries on a large commerce direct with Europe; the exports exceed 3¾ and the imports 4½ millions sterling. The houses for the most part are of a single story; for the rest, the city is laid out on, a smaller scale, on the lines of Buenos Ayres, with narrow streets, ill paved, few and paltry plazas, and only one monument of note—a lofty marble shaft (1883) bearing a figure of Victory and surrounded by four statues. Tramways (with 6 miles of rails) run in every direction, and there is a telephone to Buenos Ayres. The city possesses an exchange, a theatre, a great bull-ring, two markets, hospitals, steam-elevators, a sugar-factory, &c. Rosario was founded in 1725. Pop. (1887) 55,000.

Rosary, a string of larger and smaller beads used by Catholics as an aid to memory in keeping account of the number of Paternosters and Ave Marias recited. There are various patterns in use; a very ordinary one is a rosary of fifty-five beads, fifty small ones for the Ave Marias, separated into groups of ten by five large ones to mark Paternosters. The custom of reciting the Lord's Prayer many times in succession dates from a very early period of the Christian church; the custom of keeping a note of the prayers recited by means of strings of beads was so common in the East amongst Hindus and Mohammedans that the use of the rosary for this purpose has been said to have been introduced into Christian Europe by the Crusaders. The name (Lat. *rosarium*, 'a garden of roses' or 'chaplet of roses') first occurs in the 13th century, and seems to be derived from *Rosa mystica*, a term given to the Virgin herself, or from a set of prayers being thought of as the Virgin's rose-garden; less probable is the suggestion that the name comes from the beads being originally made of rosewood. The beads are now of various material—berries, wood, stone, ivory, metal, &c., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose. The name is also given to a series of prayers ('Rosary of the Blessed Virgin') consisting of fifteen decades, comprising fifteen Paternosters and Doxologies, and 150 Ave Marias, divided into three parts. The Lesser Rosary consists of one of the three parts, comprising five decades or mysteries.

Rosary Sunday, the first Sunday in October, is a feast instituted by Gregory XIII. for the Confraternity of the Rosary, and made of universal observance after the victory of the Emperor Charles VI. over the Turks, in gratitude to the Blessed Virgin. An impetus has been given to the devotion of the rosary by Leo. XIII., who enjoined its daily use in public during October. In London roses are blessed and distributed as souvenirs, and the rosary recited continually during the day.

Rosas, Juan Manuel, Argentine dictator, was born in Buenos Ayres, 30th March 1793, entered the army of Buenos Ayres in 1820, was appointed commander-in-chief in 1826, and was governor of the province from 1829 to 1832. Then, being disappointed of re-election, he headed a revolt, and in three years succeeded in obtaining office again, with extraordinary powers. From 1835 to 1852 he governed as dictator, not of Buenos Ayres alone, but practically of the interior also. His rule was a rule of terror and nearly constant bloodshed; one of his chief opponents published, so early as 1843, a detailed list of 22,405 victims of the relentless savagery with which he pursued his policy of extirpation against the Unitarians (the advocates of centralisation, that is to say, as opposed to the Federalists, for whose principles Rosas professed to contend). Many refugees found an asylum in Urugnay, and therefore Rosas willingly supported the attempt of his partisan, General Oribe, to make himself master of the neighbouring republic; and, after the fall of Oribe's government, Rosas in 1839 invaded Urugnay with 7000 men, was defeated, and in 1843 sent Oribe back with an army of 14,000 men to attack Montevideo. The long siege which followed led to the joint intervention, in 1845, of England and France, the blockade of Buenos Ayres (1845–47), and the temporary opening of the Paraná to free navigation. But the river provinces could not be induced to rise against Rosas, until in 1849 a treaty was signed by which he secured for Buenos Ayres the entire navigation of the Plate, the Uruguay, and the Paraná. This roused the other provinces, and in 1851 Urquiza, the governor of Entre Rios, supported by Brazil with both money and men, defeated Oribe in Uruguay, and won over his troops; then, with a force of 30,000, he marched against Rosas, and on 3d February 1852 routed him at Monte Caseros, near Buenos Ayres. Rosas escaped to England; and, although the Argentine congress in 1861 condemned him to death as a 'professional murderer and robber,' specifying 2034 assassinations carried out by his orders, he lived comfortably near Southampton till his death, 14th March 1877.

Roscellinus. See Scholasticism.

Roscher, Wilhelm, the most eminent expounder of the historical school of Political Economy (q.v.) in Germany, was born at Hanover on 21st October 1817. He studied at Göttingen and Berlin, and in 1843 was appointed professor of Political Economy at Göttingen, but in 1848 was called to fill the corresponding chair at Leipzig. His principal books are *System der Volkswirthschaft* (4 vols. 1854–86; 18th ed. 1887; 21st ed. 1894; Eng. trans. 2 vols. Chicago, 1879), *Die Nationalökonomie des Ackerbaues* (10th ed. 1882), *Grundlagen der Nationalökonomie* (17th ed. 1884), *Geschichte der Nationalökonomik in Deutschland* (1874), *Zur Geschichte der englischen Volkswirthschaftslehre* (1851–52), *Kolonien, Kolonialpolitik und Auswanderung* (3d ed. 1885). He died 3d June 1894.

Roscius, Quintus, was born at Solonium, a village near Lanuvium, and rose to be the greatest comic actor in Rome. So much was he admired that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favour, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons Roscius also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effec-

tively—the orator by his diction, or the comedian by his gesticulation. So sensible was Roscius of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chærea for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 B.C.) in his extant oration, *Pro Q. Roscio Comœdo*. He died 62 B.C., having attained such perfection in his peculiar art that to be a 'Roscius' became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, Æsopus the tragedian, an immense fortune, realised upon the stage. See Ribbeck, *Die Römische Tragödie* (Leip. 1875).—For the 'Young Roscius,' see BETTY.

Roscoe, WILLIAM, historian, was born at Liverpool on 8th March 1753, his father being a market-gardener. In 1769 he was articled to an attorney at Liverpool, and began to practise there on his own account in 1774. During this period he assiduously cultivated his mental powers, turning his attention especially to the Italian language and literature. In 1773 he first appeared in print as the author of a poem, *Mount Pleasant*, now forgotten; and in 1787–88 published *Wrongs of Africa*, a courageous protest against the slave-trade. But it was his *Life of Lorenzo de' Medici, called the Magnificent* (1796), which established his literary reputation; it went through several editions, and was translated into German, French, and Italian. In 1805 appeared his second important book, *Life and Pontificate of Leo X.* This, like the former, appeared in German, French, and Italian, and was received with much commendation, though its tone and spirit, especially with reference to the Reformation, were severely criticised. About the year 1800 he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. From his pen came, besides the above-mentioned books, a collection of *Poems* (1857), of which by far the best known was the *Butterfly's Ball;* also a *Memoir of R. R. Jones* (1822). He issued an edition of Pope in 1825. Roscoe died at Liverpool, June 30, 1831. During the later years of his life he gave much attention to the study of botany, and wrote a monograph on Monandrian plants. See Life by his son Henry Roscoe (1833), and Espinasse's *Lancashire Worthies* (2d series, 1877).

SIR HENRY ENFIELD ROSCOE, chemist, born in London 7th January 1833, was a grandson of the above, and the son of Henry Roscoe, barrister. He was educated at the Liverpool High School, and later at University College, London, and at the university of Heidelberg. He was appointed professor of Chemistry in Owens College, Manchester, in 1858, and rendered valuable services towards the organisation of this institution. He was returned member of parliament for the south division of Manchester in 1885, was re-elected in 1886, and in the latter year he resigned his professorship. He has served on the Royal Commissions on Noxious Vapours and on Technical Education, and is a member of the Scottish Universities Commission. He was elected a Fellow of the Royal Society in 1863. He was president of the Chemical Society in 1880, of the Society of Chemical Industry in 1881, and of the British Association for the Advancement of Science at the Manchester meeting in 1887. Of his original contributions to chemical science the most important are researches on the measurement of the chemical activity of light, and on vanadium and its compounds. His published works include *Spectrum Analysis*, a course of lectures (1868) on the subject; his well-known *Lessons in Elementary Chemistry* (1870); and his *Treatise on Chemistry* (written in conjunction with Schorlemmer), in 3 vols. (1878–89; new ed. 1894 *et seq.*). He lost his seat in parliament in 1895.

Roscoff, a seaport on the north coast of the French department of Finistère (long the headquarters of smuggling into England), 33 miles NE. of Brest. The men are all sailors; the women grow vegetables. The place is resorted to for sea-bathing, and here is a marine zoological station. The garden of the Capuchin monastery contains a fig-tree whose branches, trained over scaffolding, could give shelter to 200 people. Pop. 1751. Here Mary Queen of Scots landed in 1548, and the Young Pretender after his escape from Scotland.

Roscommon, an inland county of Connaught, Ireland, is bounded on the E. by the Shannon, and on the W., in part, by the Suck; it is 62 miles long from north to south, by 35 miles from east to west. Area, 607,691 acres, of which barely one-fifth is under crops (hay, potatoes, oats); more than one-half is permanent grass; one-sixth is waste. It belongs to the central plain of Ireland, but rises in the north into the Curlew (800 feet) and Braulieve (1377 feet) Mountains. Several lakes occur, as Allen, Boderg, and Ree, expansions of the Shannon, and Key, Gara, and Glinn in the north-west. The soil in the central districts is in general light, but fertile, and affords some of the finest sheep-pasture in Ireland in the 'Plain of Boyle.' The chief industry is the feeding of sheep and cattle, especially the former. Coal and iron exist, but are not worked; there are no manufactures. The chief towns are Roscommon, Boyle, Castlerea, Elphin, and Strokestown. Pop. (1841) 254,551; (1861) 157,272; (1881) 132,490; (1891) 114,194, of whom 110,147 were Roman Catholics. Roscommon sends two members to parliament, one for each of the divisions. It possesses a number of Celtic antiquities, raths, &c., several remains of strong castles, and some fine ecclesiastical ruins.

ROSCOMMON, the county town, 96 miles W. by N. of Dublin, dates from the 13th century, when it arose around a Dominican abbey, founded by the O'Conor in 1257, and a castle built ten years later by Sir Robert de Ufford; the remains of both still exist. Roscommon, pop. 2117, has an important cattle-market.

Roscrea, a market-town of Tipperary, Ireland, 77 miles SW. of Dublin, is a very ancient town; here St Cronan built a church, and had a celebrated school in the 7th century. Considerable remains of a castle, a lofty round tower (80 feet high), and ruins of two abbeys exist. Pop. 2801.

Rose. The rose, the most lovely and fragrant of flowers, the favourite of poets and the national emblem of England, is a shrub or sometimes a tree, very widely distributed, and giving name to the large and comprehensive order Rosaceæ, to which some of our choicest fruits belong. Restricting ourselves to the genus Rosa, which alone we acknowledge as the rose, we find the characteristics thus: shrubby growth, stems generally prickly, leaves alternate, stipulate, flowers terminal, often corymbose, spreading with five petals, in colour white, yellow, pink, or red, stamens numerous, styles exserted, seeds (achenes) numerous, enclosed in a fleshy berry, globular or ovate, which is known as the hip or hep, and is in some sort edible. The calyx is generally five-lobed, and the lobes are more or less pinnatised, and sometimes (as in the moss rose) furnished with a beautiful process of filament.

(1) The wild rose is a native of the northern

hemisphere, found in all temperate climes, and even as far south as Abyssinia, the Indian Peninsula, and Mexico, extending also to the arctic zone, and of such diversity that more than 200 species were admitted by former botanists, which have now been reduced, however, to less than a fifth of that number. In Britain we find it indigenous as *Rosa spinosissima* (the Burnet-rose, from which descend the many varieties of Scotch rose); *Rosa canina* (the Dog-rose of our hedges, with several sub-varieties); *rubiginosa* and *micrantha*, well known as the Sweet Briers; *arvensis*, a prostrate and unfragrant kind; *tomentosa* and *villosa*, having downy foliage and deep-red blossoms. The recent tendency of botanists, gladly accepted by the gardener, has been to restrict the number of species and allow more scope to variety, so that the above list may soon be compressed.

(2) The cultivated rose is a fuller and generally larger form, obtained by the nurture and skill of the gardener, and still receiving improvement by skilful crossing and loving observance. In the *Gardener's Chronicle* of 1885 may be found Mr Baker's scientific classification of garden roses, which are marshalled into ten companies or groups, chiefly according to leaf and prickle. Mr William Paul, however, in the last edition of his great work, permits us to reduce these ten groups to six, which will be as follows: Simplicifoliæ, Systylæ, Banksianæ, Bracteatæ, Centifoliæ, and Caninæ. But the general grower may be well content with the arrangement in the catalogues of our leading nurserymen, as recognised by the National Rose Society, and observed in our chief exhibitions; though the principle of division is not botanical, neither is the broad line drawn between summer and 'perpetual' roses always justified by fact; so that many good rosarians now protest against the too popular neglect of a fragrant, lovely, and freer flowering class.

(*a*) Summer roses, thus ostracised by a hasty vote, are of many families, and bloom for the most part in June and July—the Boursault, the Scotch Rose, the Damask, the Provence, the Moss, the French and Hybrid French, the Bourbon and Chinese Hybrids, the Austrian and Sweet Brier, the Ayrshire, Evergreen, and Multiflora, the Polyantha, Prairie, and Banksian roses, as well as some few others. Many of these are of the greatest beauty—for instance, the Moss rose, perhaps the loveliest of all flowers; and some are the best of all for trellis or for pillar, and the hardiest in bad weather.

(*b*) The Perpetual, or *Remontant* rose, as the French more correctly term it, instead of making growth alone after the gorgeous summer show, affords a succession, more or less continuous according to variety and weather, of bud and bloom until the frosts forbid. Yet even with these it is rare to find the aftermath of beauty as free or as fine as the summer crop had been; and many of the so-called perpetuals retire as meekly as the summer rose, especially in dull seasons. Perpetual roses are chiefly as follows: the Chinese or Monthly, the Hybrid Perpetual, the Tea-scented, Bourbon, Noisette, Macartney, Rugosa, Microphylla, Lawrenceana, and Perpetual Scotch. The old Chinese, *Rosa Indica*, commonly called the Monthly Rose, is still popular as an early and abundant bloomer; so are the Bourbons and Noisettes. But the Hybrid Perpetual and Tea-scented are now the chief favourites of the rose-grower, and have almost engrossed his attention. Of these two classes the former has for many years been undoubtedly the leading rose, but the Tea begins more and more to vie with it in favour, and many rosarians now place it first, for its exquisite refinement, grace, and delicacy, bewitching modesty, and pensive charm. But the hybrid perpetual claims bolder brilliance, more velvety damask, and profundity of glow. And indeed it seems difficult

Fig. 1.—Rosa rugosa.

to achieve or conceive more perfect beauty than has already been attained by loving ingenuity and persevering skill in many of the roses we now possess; though manifold gardeners are hankering still for a blue rose, which would not accord with the form and tint of the foliage if they got it.

Roses are also divided, according to the form of flower, into globular, cupped, compact, and expanded, the last named often becoming reflexed in the later stage of bloom; and again, according to modes of culture, into standards, half-standards,

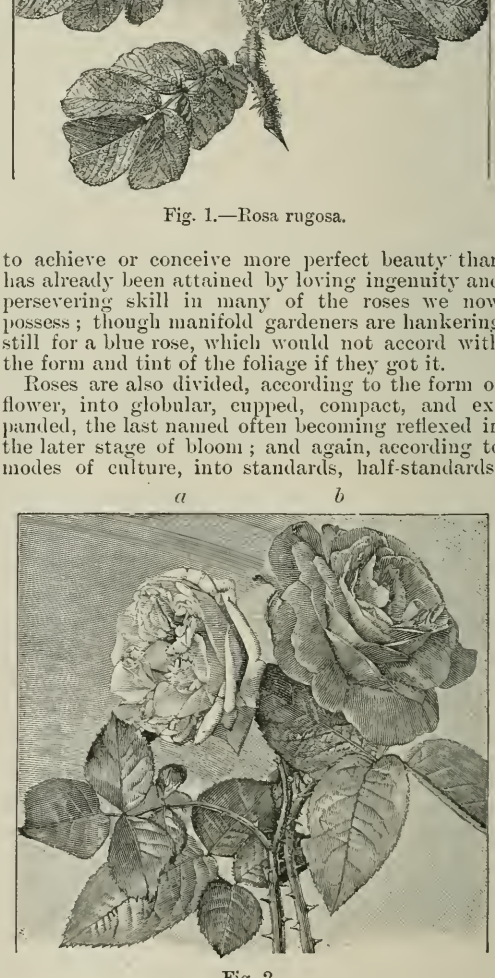


Fig. 2.
a, Tea-rose; *b*, Hybrid perpetual.

pyramids, bushes, pendulous, pillar, and trellis form. The standards and half-standards, once so popular, are now in less demand, though still approved by those who plant for exhibition, or special effect at a distance; and the bush (the more natural and easy growth) becomes every year more general. For pillar and trellis work there are but few of the hybrid perpetuals and tea-scented sufficing in vigour and hardiness; though certain

strains have been obtained of some of the leading favourites, such as *Jules Margottin* and *Devoniensis*, through 'sports' (as it is expressed) of the old kind, which serve the purpose fairly; and under glass or in a very snug spot that Coryphæus of yellow roses, *Maréchal Niel*, affords a grove of gold.

The question of stock must also be discussed, without acrimony if possible, though upon no other has there been so hot a war of roses. For any kind that is strong enough in constitution to support itself its own roots are the best feet and feeders, ousting all trouble of suckers, and often affording renewal by means of young shoots. But many of the fairest and sweetest, especially of the tea-scented class, require stouter sustenance, and must be budded or grafted on a more robust variety. The stocks chiefly used by our nurserymen are the Dog-rose, Manetti, and De la Grifferae; and the first is procured in three different ways—from its home in the hedges, or from cuttings, or from seed; and each way has its advocate. Others prefer the Manetti, a seedling Italian rose, as stock; and some, especially of the tea varieties, do best upon La Grifferae. But as a rule the Manetti is a treacherous foster-mother, affording brief vigour, and encroaching with deceptive suckers. Whatever stock may be chosen, the nobler rose is worked upon it, either by budding or grafting, and must engross the entire resources.

Again there are roses not a few, of delicate constitution or feeble habit, which should be grown in pots and sheltered through the winter. Many also of the stronger kinds are cultivated thus to bloom in the winter and spring, and some are of little value otherwise. But they must have plenty of air and light, and will not endure strong forcing. The Tea-rose, *Indica odorata*, descended from the Chinese blush and yellow, is grown most largely under glass, whether in pots or border, and being most lovely in the bud is especially fitted for bouquets. *Maréchal Niel* (perhaps more correctly classed as a Noisette of late), *Niphetos*, *Catherine Mermet*, and *Souvenir d'un Ami* are at present most popular for this sweet use.

New varieties of the rose are loudly heralded every year, and every season adds one or two lasting names to the lengthy catalogue. But old friends also pass out of date, and are no longer heard of; sometimes from a real advance upon them, sometimes from their own relapse. About 1860 nearly all new roses were the product of French nurserymen; but now we get many quite as good from the skill of our own rosarians. The crossing of the flowers is a process needing both judgment and dexterity. But the general grower will be content to cultivate the established kinds, which require no great trouble. Their abode must not be overhung, nor beset with stagnant water, the soil should be rich and deeply delved, and well-compressed round the neck of the plant. Plenty of water must be given in time of drought, and a mulching of good manure is welcome, and the growth of leaf and bud must be secured from countless enemies by daily and even nightly care. Three-quarters of the buds should be nipped off when true discretion orders it. As soon as the first flush of bloom is past, a little judicious pruning helps the prospect of a later crop; for the winter there should not be much shortening of the branches, unless they are threatened by the wind; but the general pruning remains for March.

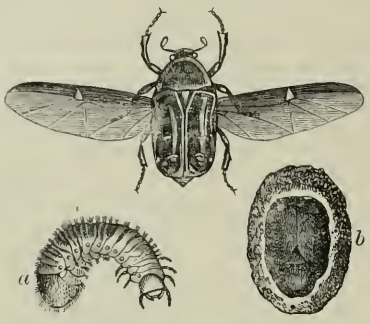
See books by W. Paul (9th ed. 1888, with 1898 supplement), Dean Hole (15th ed. 1896), Ellwanger (New York), Baker, Cranston, Rivers, Shirley Hibberd, Sawer; and French books by Jamain and Forney, Singer, and Lachaume. See also PERFUMERY, OTTO OF ROSES; and for the Roman de la Rose, see FRANCE, p. 786. Rose is a name for Erysipelas (q.v.)

Rose, SIR HUGH. See STRATHNAIRN.

Rosebery, ARCHIBALD PHILIP PRIMROSE, EARL OF, was born in London, 7th May 1847, was educated at Eton and at Christ Church, Oxford, and succeeded his grandfather as fifth earl in 1868. He entered parliament in 1871, acquired in unusual measure the goodwill of the democracy, and was everywhere welcomed as an effective and entertaining speaker. In 1874 he became president of the Social Science Congress, in 1878 Lord Rector of Aberdeen University, and in 1880 of Edinburgh. From 1881 to 1883 he was Under-secretary for the Home Department, and in 1884 became First Commissioner of Works. In Mr Gladstone's next short administration (1886) he was Secretary for Foreign Affairs, an office he held till the fall of the government six months later; but even in that short period he established for himself a high reputation. In 1883–84 he visited Australia; and he has strongly supported Imperial Federation. In 1884 he moved for a select committee to inquire how best the efficiency of the House of Lords might be improved. He presented a magnificent swimming-bath to the People's Palace in the east end of London, in token of his interest in all movements for the social improvement of the people. In 1889 he was elected by the City Division to the London County Council, and was successful and assiduous as its first chairman till he resigned in 1890. He was re-elected and acted for a few months in 1892, till the political duties of an approaching general election led to his resignation. When Mr Gladstone resumed office in 1892 Lord Rosebery again became Secretary for Foreign Affairs, displaying, as on the former occasion, a tact and firmness that secured the approval of all parties. On the resignation of Mr Gladstone in 1894, Lord Rosebery became the head of the Liberal ministry. He failed to secure unanimity in his cabinet and to conciliate the hearty support of the various sections of his party. His government lost the confidence of the country, and soon after he resigned a general election (July 1895) returned an overwhelming majority for the new Unionist government of Lord Salisbury. In 1896, finding his opinions on the Armenian problem more in accordance with those of Lord Salisbury than with Mr Gladstone's, he resigned his leadership of the Liberal party to obtain more freedom in giving expression to them; his view being that a European war should not be risked on this question. When the Fashoda difficulty with France became acute in 1898 he by his speeches strongly supported the government as expressing the resolution of a united nation; and a large section of Liberals continued to look to him as the future leader of the party. In 1878 Lord Rosebery married a daughter of Baron Meyer de Rothschild (died 1890). In 1891 he published a monograph on Pitt in the 'English Statesmen' series. He is keenly interested in Scottish history and Scottish literature, and as president has taken active part in the work of the Scottish History Society. Two addresses in connection with the Burns Centenary were printed in 1896. In 1896 a collection (unauthorised) of his political speeches was published, and in 1899 another of *Appreciations and Addresses*, dealing with Burns, Burke, London, Town Councils, &c. His *Peel* (1899) appeared first in *The Anglo-Saxon*. Lord Rosebery, who till 1900 kept an extensive racing stud, in 1894 and 1895 won the Derby with his horses Ladas and Sir Visto. He is LL.D. (Cambridge, 1888), K.G. (1892), and K.T. (1895). His *Napoleon: the Last Phase*, appeared in 1900. There are Lives of him by Miss Stoddard (1900) and T. F. G. Coates (1900).

Rose-chafer (*Cetonia aurata*), an injurious beetle, whose grubs destroy the roots of straw-

berries and other plants, while the adults spoil the flowers of roses, strawberries, and seed-turnips. The eggs are laid in the ground; the full-grown grubs are whitish and about an inch and a half in length; after two or three years they pupate inside earthen cocoons. The adults, which are well able to fly from place to place, measure about an inch in length, are golden green above, coppery with a tint of rose beneath. Where they are likely to do



Rose-chafer (*Cetonia aurata*): *a*, larva; *b*, cocoon.

harm the adults and grubs should be collected and destroyed, and recourse may be had to remedies similar to those used against cockchafers.—The 'rose-bug' of the eastern United States is another beetle (*Macrodactylus subspinosus*), a voracious pest which often appears in immense numbers and destroys the flowers of rosaceous plants.

Rosecrans, William Starke, an American general, was born at Kingston, Ohio, 6th September 1819, graduated at West Point in 1842, and was employed as an engineer until 1854, when he resigned, became a civil engineer, and afterwards engaged in coal-mining and the manufacture of kerosene. In 1861 he volunteered as an aide to General McClellan, won an action at Rich Mountain in July, was commissioned brigadier-general in the United States army, and succeeded McClellan as head of the Department of the Ohio, and kept Lee out of western Virginia. In 1862 he commanded a division at the siege of Corinth, and after its capture was given the command of the Army of the Mississippi; on 19th September he defeated General Sterling Price at Iuka, and on 3d and 4th October he successfully defended Corinth against Price and Van Dorn. From October 1862 to October 1863 Rosecrans was in command of the Department of the Cumberland; in the battle at Stone River (December 31 and January 2), against Bragg, he by his personal exertions converted what nearly had been a defeat into a victory, after each side had lost over 9000 men; but at Chickamauga, September 19–20, 1863, he was defeated by Bragg, with a loss of 16,179, although he held Chattanooga, and the Confederates lost 17,804 men. Rosecrans was relieved of his command by General Grant; but in 1864 he was placed over the Department of the Missouri, and repelled Price's invasion of that state. He afterwards received the brevet of major-general, and resigned from the army in 1867. In 1868–69 he was minister to Mexico, in 1881–85 a member of congress, and in 1885 appointed registrar of the U.S. treasury. He died in March 1898.

Rosemary (*Rosmarinus*), a genus of plants of the natural order Labiatæ, and nearly allied to Sage (Salvia), from which it differs in its filaments having an awl-shaped tooth, directed downwards a little above the base. Only one species is known, *R. officinalis*, an evergreen erect shrub of 4 to 8 feet high, with linear leaves, and pale bluish flowers, growing in sunny places, on rocks, old walls, &c., in the countries around the Mediterranean Sea, and cultivated elsewhere as an ornamental and aromatic shrub. The leaves have a short whitish-gray down beneath, a penetrating camphor-like odour, and a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, *Oil of Rosemary*, which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. *Spirit of Rosemary*, made by distillation of sprigs of rosemary with rectified spirit, is used to give a pleasant odour to lotions and liniments. Rosemary has been advantageously administered internally in cases of chronic diarrhœa, and of a relaxed state of the system.—

Rosemary (*Rosmarinus officinalis*). (Bentley and Trimen.)

Oil of Rosemary is a principal ingredient of the perfume called *Hungary Water*. The celebrated white honey of Narbonne owes its reputation to being collected from the flowers of rosemary. In some places, by a confusion of similar names, the totally distinct plant Costmary (q.v.) is called Rosemary. The name Wild Rosemary is given to *Ledum palustre*, a shrub with narcotic acrid properties.

Rosendale, a village of New York, by rail 8 miles SSW. of Kingston, or 53 S. of Albany, has a pop. of only some 600, but is noteworthy for its great manufacture of hydraulic cement. In 1886, when the United States produced 4,500,000 barrels (300 lb.) of cement, nearly one-half came from the Rosendale district, the rest being drawn from Pennsylvania, Kentucky, Illinois, Colorado, Indiana, Tennessee, and Alabama in varying proportions. Most of the American cement is derived from natural cement rock, as at Rosendale; the rest being 'artificial Portland.'

Roseneath, or Rosneath, a village of Dumbartonshire, on the SW. shore of the Gare Loch, with a palace of the Duke of Argyll. Pop. 2000.

Rosenkranz, Karl, philosopher, a pupil of Hegel, was born at Magdeburg on 23d April 1805, studied in Berlin, Halle, and Heidelberg, taught at Halle as *privat-docent* (1828), and as professor of Philosophy (1831), in 1833 was called to the chair of Philosophy in Königsberg, and there he died, blind, on 14th June 1879. He was a man of wide culture and a voluminous writer, his works including *Encyclopädie der theologischen Wissenschaften* (2d ed. 1845), *Psychologie* (3d ed. 1863), *Kritische*

Erläuterungen des Hegelschen Systems (1840), criticisms of Schleiermacher's (1836) and Strauss's Doctrines of Belief (1845), *Meine Reform des Hegelschen Systems* (1852), and *Wissenschaft der logischen Idee* (1858–59) in philosophy, and books on the History of Poetry, *Diderot's Leben und Werke* (1866), *Leben Hegels* (1844), *Goethe und seine Werke* (2d ed. 1856) in literature. He also edited, with Schubert, *Kant's Werke* (12 vols. 1838–40).

See his autobiographical *Von Magdeburg nach Königsberg* (1873) and *Life* by Quäbicker (1879).

Rosenmüller, Johann Georg, a German theologian and eloquent preacher, was born at Ummerstadt near Hildburghausen, 18th December 1736, studied in Altdorf, and filled chairs at Erlangen (1773), Giessen (1783), and Leipzig (1785), where he died, 14th March 1815. He published about 100 books of great popularity. Of these the most important was *Scholia in Novum Testamentum* (6th ed. by his son 1815–31).—Ernst Friedrich Karl, eldest son of the foregoing, was a distinguished biblical critic and Orientalist. He was born at Hessberg near Hildburghausen, 10th December 1768, studied at Königsberg, Giessen, and Leipzig, became extra-ordinary professor of Oriental Literature at the last in 1795, ordinary professor in 1813, and died 17th September 1835. His *Institutiones ad fund. ling. Arab.* (1818) and *Analecta Arabica* (3 vols. 1824–27) were of great importance; his masterpiece, the *Scholia in Vetus Testamentum* (11 parts in 23 vols. 1788–1835), still retains no small part of its value. Other works are *Handbuch für bibl. Kritik und Exegese* (1797–1800), *Das alte und neue Morgenland* (1816–20), *Handbuch der biblischen Alterthumskunde* (4 vols. 1823–31).—A younger brother, Johann Christian (1771–1820), was twenty years a professor of Anatomy and Surgery at Leipzig, and wrote on anatomy.

Rose-noble. See Noble.

Rose of Jericho (*Anastatica hierochuntica*), a plant of the natural order Cruciferæ, which grows in the sandy deserts of Arabia, and on rubbish, the roofs of houses, and other such situations in Syria and other parts of the East. It is a small, bushy, herbaceous plant, seldom more than six inches high, with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved towards the centre, so that the plant assumes an almost globular form, and in this state it is often blown about by the wind in the desert. When it happens to be blown into water the branches expand again, and the pods open and let out the seeds. Numerous superstitions are connected with this plant, which is called *Rosa Mariæ*, or *Rose of the Virgin*. If taken up before it is quite withered the plant retains for years its hygrometric property of contracting in drought and expanding in moisture.

Rose of Sharon, a name given to an ornamental malvaceous plant, the *Hibiscus syriacus* (see Hibiscus). But the Rose of Sharon of the Bible was doubtless a bulbous plant, probably a kind of narcissus.

Rose'ola, or Rose-rash, is a name sometimes applied to the milder varieties of Erythema (q.v.), where the eruption consists merely of a reddening of the skin, with little or no swelling. Such an eruption sometimes occurs as an early symptom in smallpox, and during the stage of reaction in cholera; it is also one of the commonest of syphilitic eruptions. But it frequently appears independently of any such disease, and is then usually an indication of some slight disorder of digestion, or of some other internal source of irritation. It usually subsides in the course of two or three days at most, and causes very little constitutional disturbance. Occasionally it is attended by slight fever and sore throat, and may then be extremely difficult to distinguish from a mild case of scarlet fever. No treatment is usually required, but a mild saline laxative (e.g. a seidlitz powder) may be administered with advantage.

Roses, Wars of the, a disastrous dynastic struggle which desolated England during the 15th century, from the first battle of St Albans (1455) to that of Bosworth (1485). It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the Houses of York and Lancaster, whose badges were the white and the red rose respectively. The Lancastrian claim to the crown came through John of Gaunt, third son of Edward III., created Duke of Lancaster in 1362, having married three years before the heiress of Henry, Duke of Lancaster. On John of Gaunt's death King Richard II. seized his lands, whereupon his son Bolingbroke, then in exile, returned to assert his rights, and, finding his cause exceedingly popular, was emboldened to claim the crown, which was granted him by the parliament after the deposition of his cousin Richard II. After the House of Lancaster had thus possessed the throne for three reigns (Henry IV., V., VI.), Richard, Duke of York, during the weakness of the last reign, began to advance, at first somewhat covertly, his claim to the throne. He was the son of Richard, Earl of Cambridge, by Anne, sister of Edmund Mortimer, the last Earl of March, and he was thus the nearest actual heir to Edward III. through his second son, Lionel, Duke of Clarence. The reigning family had become unpopular from its loss of France and its clericalism, but its strength was great in the north, where the power of the Percies was alone rivalled by that of the Nevilles. The Yorkist strength lay chiefly in the mercantile population of the southern counties. The effect of the war was the almost complete destruction of the old nobility, the weakening of the power of the church, and an enormous increase in the power of the crown, together with the great advance of the commercial classes and the large towns, destined a few generations later to measure strength with the crown itself. In 1454 Richard was appointed Protector of the realm during Henry's insanity, and on his recovery soon after took up arms against his rival Somerset, and crushed him at the first battle of St Albans (1455). A second period of insanity again gave him the protectorship, but the king recovered in 1456. His weak attempts at reconciliation proved failures, and in 1460 the Yorkist earls of Salisbury, Warwick, and March defeated and captured the king at Northampton (1460). The Lords now decided to grant the reversion of the crown to York, passing over Prince Edward. The queen refused assent, and fled to Scotland, returning only after the death of York at Wakefield (December 30, 1460); but York's son Edward quickly gained a victory at Mortimer's Cross (1461), though Warwick was defeated by the queen's main body in the second battle of St Albans (1461). But London rallied to young Edward, and in June he was crowned at Westminster after the great victory of Towton (1461). Next year Queen Margaret again appeared in the north, but in 1464 her forces were utterly routed by Warwick's brother Montague at Hedgeley Moor and Hexham. The estrangement of Warwick and his alliance with Queen Margaret's party drove Edward IV. from England and restored Henry VI. But Edward returned in the spring of 1471, defeated (and slew) Warwick at Barnet, and next the queen at Tewkesbury. The murder of Prince Edward after the battle, and the convenient death of Henry VI. in the Tower, cleared away his two chief dangers and left him to reign in peace. The accession of Henry VII. after

the death of Richard III. on Bosworth field (1485), his marriage with Elizabeth, daughter of Edward IV. (1486), and the blending of the red and white rose in the Tudor badge, marked the termination of the Wars of the Roses, although the reign of Henry, whose own title was not good, was from time to time disturbed by the pretensions of Yorkist impostors.

See Sir J. H. Ramsay, *Lancaster and York: a Century of English History* (2 vols. 1892); Wylie, *England under Henry IV.* (4 vols. 1884–98); and the articles on the HENRIES IV.–VI., EDWARD IV., &c.

Rosetta, a town of the Nile delta, on the old Bolbitic arm, 9 miles from the Mediterranean and 44 miles by rail NE. of Alexandria, which outstripped it. In the time of the Crusades it was a place of great strength; and St Louis made it the basis of his crusading operations. Sultan Beybers, after that (in 1251) founded the present city farther inland. The Arabs call it *Raschid*, believing that Haroun al-Raschid founded the old city. Pop. (1882) 16,666. A few miles to the north of the town was discovered the Rosetta Stone, which gave the first clue to the interpretation of the Hieroglyphics (q.v.). At Rosetta too are barrage works for holding up the Nile water until it can be directed into the irrigation channels. These works, originally constructed by Mougel Bey (1843–61), were almost entirely rebuilt by Sir C. Scott Moncrieff in 1886–90. The barrage is 508 yards long, and has 61 arches.

Rose-water. See PERFUMERY.

Rose-window, a circular window with tracery, such as is shown in our illustrations to the articles Amiens and Paris.

Rosewood. The most valuable rosewood comes from Brazil. Two kinds, or two qualities, are known in commerce. These much resemble each other, the one, which is usually rather the better figured of the two, coming from Rio de Janeiro, and the other from Bahia. Although Brazilian rosewood has been used for making furniture in Europe for more than two hundred years, the species of tree or of trees which yield it are not known to European botanists. Mr Bentham, judging by the appearance of the wood and of the leaves of the tree, or of one of those rosewood trees, has assigned it to the genus Dalbergia. This view is probably correct. At all events there are three well-known Indian species of this genus called respectively *D. latifolia*, *D. sissoo*, and *D. cultrata*, all of which, except that they want the dark blotchy veining, closely resemble the Brazilian rosewoods. The cellular structure of the wood is similar in the whole of them. They are all rich in resinous colouring matter, and all except *D. latifolia*, which is slightly lighter, have a specific gravity ranging between ·900 and 1·000, so that they just float in water. Since at least 1830 the *D. latifolia* has been known in England as Indian rosewood. The South American and Indian kinds named above are all hard and durable, and take a fine polish. They are in every way excellent furniture woods, the Brazilian kinds being only more valuable because they are more beautifully figured. The Indian rosewood is often elaborately carved by native workmen, and for this purpose it is well suited. Of late years much of the furniture, even of a superior kind, made of mahogany in Great Britain, has been stained of a rosewood colour. An inferior kind of rosewood is brought from Honduras. The name is said to have been given because of a striking rose-like odour that the wood gives out when freshly cut.

Rosherville Gardens, 'the place to spend a happy day,' were formed near Gravesend by Mr Rosher, the original proprietor, in worked-out chalk-quarries. Music, a theatre, a zoological collection, as well as the pleasant neighbourhood, attract visitors.

Rosicrucians. The mystery which has surrounded this brotherhood of Hermetic philosophers has afforded a wide field to romantic fiction, and has much exaggerated their own pretensions. A German pamphlet, *Fama Fraternitatis of the Meritorious Order of the Rosy Cross*, published at Cassel in 1614, advertised for the first time the existence of such an association, which then claimed an antiquity of over 120 years. From subsequent publications it is inferred that the fraternity was established, on its own showing, by Christian Rosencreutz in 1459. On this point there is no evidence outside Rosicrucian manifestoes, and all that concerns the founder is of fabulous or allegorical character. If the society existed as a corporate body when the *Fama Fraternitatis* appeared, that date may be accepted as marking at least the beginning of its public history. The other documents which claim to have been issued by the Rosicrucians are *Confessio Fraternitatis R.C., addressed to the Learned of Europe* (Cassel, 1615); *Chymical Marriage of Christian Rosencreutz* (Strasburg, 1616); *Perfect and True Preparation of the Philosophical Stone, according to the Secret of the Brotherhoods of the Golden and Rosy Cross* (Breslau, 1710; contains the unabridged laws of the order); and *Secret Symbols of the Rosicrucians of the Sixteenth and Seventeenth Centuries* (Altona, 1785–88). Whether the later publications emanated from the original society it is not possible to say, but it has been supposed that associations in imitation of the fraternity, bearing its name and emblems, were formed soon after the appearance of the first manifestoes. By these documents the Rosicrucians are represented as adepts in Hermetic mysteries, including metallic transmutation, power over elemental spirits, and knowledge of magical signatures—the *signatura rerum* of Paracelsus. They aimed at a general reform in arts and sciences, especially alchemy and medicine, and posed chiefly as professors of the healing art. They invited all students of nature to join them; but, as they gave no clue to their whereabouts, the manifestoes were by some regarded as a laborious hoax, an opinion which does not seem justified by a review of the entire evidence. An immense controversy took place at the time in Germany, whose literary centres became a battle-ground for rival pamphleteers on the merits of Rosicrucian pretensions. The foremost defenders of the order were Michael Maier in Germany, Robert Fludd, Thomas Vaughan, and afterwards John Heydon, in England. Among its adverse critics were Andrew Libavius, who afterwards changed his standpoint, and Johann Valentin Andreä (q.v.). The authorship of the original manifestoes has, at the same time, been generally attributed to Andreä, and he certainly wrote the *Chymical Marriage of Christian Rosencreutz*. The question of the authorship offers a curious field for investigation, and has exercised the controversial skill of many ingenious critics; but no satisfactory solution has ever been reached. Rosicrucians flourished in France during the period of the Revolution; there was a lodge in Mauritius about 1794; and there are traces of such a fraternity at the beginning of the 19th century both in England and Germany. A *Societas Rosicruciana in Anglia* was formed as an offshoot of masonry by Robert Wentworth Little about 1857, which is to be distinguished from the original order, and from the Rose-cross degree in freemasonry. The latter, notwithstanding its name and symbolism, disclaims all connection with the objects and history of the alchemical brotherhood.

Among works to be consulted on the subject of the Rosicrucian mystery a first place should be given to

Solomon Semler's *Impartial Collections for the History of the Rosicrucians* (Leip. 1768). De Quincey's *Rosicrucians and Freemasons* is brilliant but misleading. A review of the whole controversy, with the documents that concern it, is contained in *The Real History of the Rosicrucians* (Lond. 1887), by A. E. Waite, the author of the present article. A MS. *Treatise of Rosie Crucian Secrets*, attributed to Dr John Dee, and preserved among the Harleian MSS. in the British Museum, is a forgery of the 18th century.

Roslin, a Midlothian village, near the wooded glen of the North Esk, 6½ miles S. of Edinburgh. Its castle, dating from the 14th century, was the seat of the St Clairs, Earls of Orkney from 1379 to 1471, and afterwards of Caithness, and hereditary grand-master masons of Scotland from 1455 to 1736. The exquisite 'chapel,' built about 1450, is really the choir of an intended collegiate church, and is only 70 feet long, 35 broad, and 42 high. Its beauty lies not in the outline, but in the profusion of stone-carving lavished on pinnacles, niches, vaulted roof, and clustered columns, and especially on the famous 'Prentice pillar.' The building, essentially Scottish, has often been wrongly ascribed to Spanish, at any rate to foreign, masons. Much damaged by an Edinburgh mob in 1688, it was restored by the third Earl of Rosslyn at a cost of £5000, and has served since 1862 as an Episcopal church. On Roslin Moor the Scots are said to have twice defeated the English in one day, 24th February 1303. Pop. 730. See articles by A. Kerr in *Procs. Soc. Ants. Scot.* for 1876–78.

Rosmini. Antonio Rosmini-Serbati, one of the most original philosophers of the 19th century, was born of noble family at Roveredo in the Italian Tyrol, 25th March 1797. He grew up a pure and beautiful child, and after a stainless youth of devotion and study decided for the priesthood against his parents' wishes, and began the course at Padua in 1817. Three years later his father's death gave him an ample estate. He was ordained priest in 1821, and devoted the next five years at home with a serene but profound enthusiasm to study, meditation, and prayer. He read widely in philosophy alike ancient and modern, and already revolved within his mind a comprehensive and coherent system to serve as a basis for the truths of revelation, while on the practical side he planned a new institution for the training of teachers and priests in wisdom and holiness. From 1826 to 1828 he lived mostly in Milan, next thought out the rule of his new Order in a period of retirement and severe mortification at Domodossola in the Piedmontese Alps, visited Rome, gained the approval of Pius VIII. both for his special studies and for the institution of his Order, and published his *New Essay on the Origin of Ideas* (4 vols. 1830), which at once carried his name over the Catholic world. After a few years of labour at Trent, hampered by the jealousy of the Austrian government, which feared his Italian patriotism and his papal sympathies, he settled in 1837 at Stresa on the western shore of Lago Maggiore, and two years later received from Gregory XVI. the formal approval of his Institute. The next few years were the happiest and most fruitful of his life. Surrounded by loving and devoted friends, he sent volume after volume to the press; overpowered by his logic noble opponents to his philosophy like Vincenzo Gioberti and Count Mamiani, as well as no less able writers from the rationalistic and anti-Catholic side; and foiled the restless intrigues of Jesuit enemies, who saw in his enterprise possible dangers to the supremacy of their Order. His dream in politics, as expressed in his *Constitution according to Social Justice* (1848), was a confederation of the states of Italy under the pope as perpetual president; but his heart sank within him when the pope declared his intention to take no part in the war of liberation against Austria.

For a brief period he basked in the papal favour, and was promised by Pius IX. a cardinal's hat; while for seven weeks he served as the envoy of Piedmont at the papal court, and it was he whom the Romans asked for as their Liberal minister in the period between the murder of Rossi and the pope's flight to Gaeta. He followed the pope, but now found his mind poisoned against him by the malign suspicions of Antonelli and the reactionary party, and never afterwards regained his confidence. His *Constitution* and *The Five Wounds of Holy Church* (Eng. trans. ed. by Canon Liddon, 1883) were next prohibited by an irregular meeting of the Congregation of the Index called at Naples. Rosmini submitted without a word of protest, and returned to Stresa to spend the remaining seven years of his life in even more absolute devotion than before to his Institute and to the composition of works intended to complete and consolidate his system of philosophy. His enemies still continued to pursue him with wicked calumnies and charges of heresy in doctrine and unfaithfulness to the Holy See. But their malignity overshot its mark, and at length the pope, his eyes opened to see how he had wronged Rosmini by his haste, granted him a fair hearing, first enjoining silence on his traducers, and next subjected his whole published works to a careful scrutiny, in relation to the more than three hundred charges brought against them. The process lasted nearly four years (1851–54), but at its close the Congregation of the Index, the pope presiding, declared Rosmini's writings to be entirely free from censure, and enjoined perpetual silence on all his accusers. But he did not long survive a triumph for which he had waited with saintly patience, dying at Stresa, not without suspicion of poison, 1st July 1855. It was only in 1888 that Rosmini's restless traducers succeeded in getting forty propositions from his *posthumous* works condemned by the Holy Office.

The 'Institute of the Brethren of Charity' survived its founder, and among the Rosminian Fathers, who are mostly Italians or Englishmen, are to be found at the present day some of the ablest and most devoted sons of the Roman Church. Its fundamental idea is the principle of passivity, its aim holiness or the moral perfection of the soul. Moral perfection consists in justice or the practical recognition of each being, seen in the idea, according to the *beingness* that is in it. The *elective* or contemplative part of the discipline prepares for the *assumptive* or active part, whose constant aim is the well-being of others. The brethren, who include both clerical and lay members, undergo a two years' novitiate and take the three ordinary vows, but wear no distinctive dress and conform to the laws of the country in which they happen to be. The Institute of Charity was a large-minded attempt to adapt the monastic system and Catholic Christianity generally to the needs of the present day, and its comparative lack of success is only due to the enormous force of interested opposition brought to bear against it by the obscurantist party in the church, whose chief end is despotic power for itself and blind obedience from the people. In England it has foundations at Ratcliffe, Loughborough, Cardiff, Wadhurst, Rugby, and established in 1876 its central House at St Etheldreda's, Holborn, once the domestic chapel of the palace of the Bishops of Ely.

The foundation of Rosmini's philosophy is *being* considered as the form of the intelligence—an elemental intuition of which is implanted by Nature herself. He begins by pointing out, as an essential characteristic of cognition, a distinction between the impersonal *object known* and the personal

subject or *knower*. Human cognitions are intuitions and affirmations, and the former necessarily precede the latter, since they regard things in their possibility, rather than merely formulate assertions as to whether they subsist or do not subsist. Intuition then gives us possible objects—ideas; affirmation, things subsistent. Of ideas we may affirm (1) that they are not nothing; (2) that they are not ourselves; (3) that they have a mode of existence of their own, entirely different from that of real or subsistent things, and independent of the bodily sense. Their two essential characteristics are *universality* and *necessity;* for real objects and sensations are always particular, instead of being universal and generic, and every object which involves no contradiction is necessarily possible. These two characteristics involve two others, infinity and eternity; the origin of the ideas comes from God, for man does not receive them from the things themselves. The one *indeterminate* and wholly universal idea is that of *being* or existence; we cannot determine the subsistence of an object until we first have the idea of it, therefore perception involves the idea which is further isolated from all the other elements of the perception by the process of universalisation, through which it may be realised an indefinite number of times. When the ideas are all fully or perfectly determined, they are called *concrete;* when they remain to a certain extent indeterminate, they are *abstract*. The determinations of the ideas are sensations; these are merely the occasions of its discovery by the intelligence, which can admit that to be possible which the sensation represents as real. By the process of universalisation then we form those ideas which are completely determined; by abstraction, those which are determined only to a certain extent. It is this idea of being which makes intelligence possible: it is the necessary form of human reason, the indispensable condition given by nature herself, the parent idea which generates all others. It is cognisable by itself, as otherwise there is nothing else that could make it known; the idea of being gives us itself the essence of the thing. Herein is secured the *objectivity* of truth—the faculty of recognising the essence of things, the foundation of the divine *imperative* of duty in the conscience of man, the logical foundation on which faith and charity may be supernaturally built. *Being* is incorporeal, independent of space, spiritual, and therefore incorruptible and immortal. It is independent of time; as *being* in its essence is always *being*, and as it would be a contradiction in terms for being to cease to be being, it is eternal. But since it was united to the soul in time, it must have existed before it, and be independent of it. And thus we reach an Intelligence anterior to human intelligence—an Eternal Mind. This eternal mind is God's, and therefore God exists, and his existence and the immortality of the soul remain the true foundation of morals. But *being* as intuitively seen by nature merely gives the certainty that God exists; it cannot make God known to us until we are illumined by a new faculty—an influx of objective light, the Light of Grace. Thus a necessary place for revelation is found in the essential limitations of man's nature, and this revelation of God is contained in the Gospel of Jesus Christ, which alone can harmonise all the contradictions of the universe.

Rosmini's most important work was his contribution to Idealogy; his masterpiece is his *New Essay on the Origin of Ideas* (1830; Eng. trans. 3 vols. 1883-84) or his *Psychology* (1846-48; Eng. trans. 3 vols. 1884-88), both of which belong to the classics of philosophical literature. Death overtook him before he had completed his great projected work, the *Theosophy* (5 vols. 1859-74). A complete Bibliography of his writings, ninety-nine in number, is prefixed by Thomas Davidson to his admirable translation (1882) of the *Sistema Filosophico* (1845), grouped under the heads of Idealogy and Logic, Metaphysical Sciences, Philosophy of Morals and Right, Education and Methodology, Political Philosophy, Philosophy of the Supernatural, Ecclesiastical Prose, and Miscellaneous. The last section includes two volumes of Correspondence, but as many as 15,000 Letters are said to be still unprinted. In Mr Davidson's work will be found, besides a brief Life and a lucid Introduction, a list of books relating to Rosmini's Life and Philosophy. Here we may name the studies by Tommaseo (Turin, 1855), Franc. Paoli (Turin and Rovereto, 1880-84), and Father Lockhart (2d ed. complete, 2 vols. 1886). Rosmini's own *Sketch of Modern Philosophies and of his Own System* has been translated, with an admirable Introduction, by Father Lockhart (1882; 2d ed. 1890).

Rosoglio, a variety of liqueur, made in Italy, and flavoured with flowers or fruits, especially orange blossoms.

Ross, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Dunrossness, Montrose, Roxburgh, Ardrossan.

Ross, a market-town in Herefordshire, is finely situated on the left bank of the Wye, 14 miles SSE. of Hereford. In the parish church (1316), whose 'heaven-directed spire' is 208 feet high, is buried John Kyrle (q.v.), celebrated by Pope as the 'Man of Ross.' The town carries on a trade in cider, malt, and wool, has corn-mills and tanneries, and is much visited by tourists. Pop. (1881) 3724; (1891) 3575.

Ross, Sir John, Arctic voyager, born June 24, 1777, was a son of the minister of Inch, Wigtownshire, and was little more than nine years old when he entered the navy, serving with distinction in the French wars. His most important services were rendered in the Arctic regions, whither in 1818 he proceeded with Parry as his second in command; the objects of the expedition were to explore Baffin Bay and attempt a North-west Passage. Ross published the results of his investigations in *A Voyage of Discovery* (1819). In May 1829 he commanded a fresh expedition to the Arctic regions (fitted out by Sir Felix Booth), and discovered the peninsula of 'Boothia Felix.' Ross received, on his return in 1833, the honour of knighthood. The results of this expedition were written down in *Narrative of a Second Voyage in Search of a North-west Passage* (1835). He made yet another voyage to the Polar regions—an unsuccessful attempt to find Sir John Franklin, in 1850. Ross wrote *Memoirs and Correspondence of Admiral Lord de Saumarez* (2 vols. 1838), a *Treatise on Navigation by Steam* (1828), and other works. He died in London, August 30, 1856.

Sir James Clark Ross, his nephew, also distinguished himself as an Arctic navigator. He was born in London, April 15, 1800, entered the navy in his twelfth year, accompanied Sir John in his first and second Polar voyages, and in the interval between visited the same regions with Parry in his expeditions. He discovered in 1831 the North magnetic pole, and on his return was rewarded with a post-captaincy. After being employed by the Admiralty in a magnetic survey of Great Britain and Ireland, he was placed in command of the *Erebus* and *Terror* for an expedition to the Antarctic seas (1839), and approached within 160 miles of the South magnetic pole. He was knighted after his return home in 1843; and in 1847 published *Voyage of Discovery in Southern Regions, 1839–43* (2 vols. 1847). In 1848 he made a voyage in the *Enterprise* to Baffin Bay in search of Sir John Franklin. He died at Aylesbury, April 3, 1862. See Mackinder, *Ross and the Antarctic* (1892).

Rossall College, a large public school on the coast of Lancashire, 2½ miles SSW. of Fleetwood, was founded in 1844 for the education of the sons of clergymen and others. It has twelve entrance scholarships, thirty masters, and over 350 boys. See the *Jubilee Sketch* by Canon Beechey (1894).

Ross and Cromarty, a Highland county, the third largest in Scotland, extends from the German Ocean to the Atlantic, and is bounded N. by Sutherland, S. by Inverness-shire. In 1890–91 it was finally formed into a single county by the boundary commissioners, who also added to it the small Ferintosh (detached) district of Nairnshire, and a much smaller fragment from Inverness-shire. Its mainland portion measures 75 by 67 miles, and the total area is 2,084,900 acres or 3260 sq. m., of which 103 are water and 736 belong to a dozen islands—the Lewis, Tanera, Ewe, &c. The east coast is indented by the Dornoch, Cromarty, and Moray Firths; the west coast by eight sea-lochs (Broom, Gruinard, Torridon, Carron, &c.). The chief of the innumerable streams are the Oykell, Alness, and Conon: the Falls of Glomach, on a head-water of the Elchaig, in the SW. are 370 feet high; and beautiful Loch Maree is the largest of nearly a hundred good-sized fresh-water lakes. Mam Sodhail (3862 feet), on the Inverness-shire border, is the highest of more than thirty summits exceeding 3200 feet above sea-level, others being Ben Dearg (3547), Benmore (3505), Ben Wyvis (3429), and Ben Attow (3383). The high grounds afford good pasture, and systematic sheep-farming dates from about 1764. It reached its zenith during 1860–70, when 400,000 sheep were grazed in the county. The glens and low grounds in the more favoured portions have a fertile soil, which, with the fine climate, especially in Easter Ross, bears crops of superior quality. Still, less than 7 per cent. of the entire area is arable, and less than 70 square miles is occupied by woods and plantations. Whisky is distilled, and the salmon and sea fisheries are very valuable. Montrose was defeated at Invercharron (1650), and a small Jacobite force in Glenshiel (1718). Sir Thomas Urquhart, Lord Lovat, and Hugh Miller were natives. The chief places are Dingwall, Tain, Stornoway, Fortrose, Cromarty, Strathpeffer, and Invergordon; and the county returns one member to parliament. Pop. (1801) 56,318; (1851) 82,707; (1881) 78,547; (1891) 77,810. See separate articles on Cromarty, Dingwall, Lewis, Maree, &c.; and an article by J. Macdonald in *Trans. Highland and Agric. Soc.* for 1877.

Rossbach, a village in Prussian Saxony, 22 miles W. by S. of Leipzig and 9 SW. of Merseburg, is celebrated for the victory gained here by the Prussians under Frederick the Great (q.v.) over the combined French and Austrian armies on 5th November 1757. The 'rout of Rossbach' remained for a long time a term of reproach in the French army. The Prussians lost 540 killed and wounded, while the loss of the allies was more than 2700 killed and wounded and 5000 prisoners, among whom were 5 generals and 300 officers, and nearly 70 cannon.

Rosse, William Parsons, third Earl of, an astronomer, was born in York on 17th June 1800, and educated at Trinity College, Dublin, and Magdalen College, Oxford, where he graduated first-class in Mathematics in 1822. During the life of his father he sat in the House of Commons as Lord Oxmantown, representing King's County from 1821 to 1834; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1845. As early as 1826 he had commenced to make experiments in the construction of fluid lenses; but he subsequently devoted his powers to the construction of a speculum for the reflecting telescope. Certain defects had hitherto baffled opticians—namely, spherical aberration and absorption of light by specula, and in casting specula of large size cracking and warping of the surface on cooling; but Lord Rosse succeeded in obviating the last defect, and in counteracting in great part the other two. He began the construction of his great reflecting telescope in 1845; it weighed in all 12 tons, and was mounted in his park at Parsonstown at a cost of £30,000. The first addition to astronomical knowledge made by this telescope was the resolution of certain nebulæ into groups of stars; next came the discovery of numerous binary and trinary stars, and a description of the moon's surface. The telescope is described in the *Philosophical Transactions*, in which journal, and in the *Transactions of the Royal Society, Dublin*, most of his papers were published. Lord Rosse was president of the Royal Society from 1848 to 1854. He died on 31st October 1867, and a statue to his memory was erected in Parsonstown in 1876.

Rossendale, an electoral division of north-east Lancashire, in which is Haslingden (q.v.).

Rossetti, Gabriele, an Italian poet and man of letters, particularly concerned in Dantesque criticism, was born on 28th February 1783 at Vasto, in Abruzzo Citeriore, then forming part of the kingdom of Naples. His father, Nicola Rossetti, was engaged in the iron-trade of the district; his mother was Maria Francesca Pietrocola. The parents were not in easy circumstances, and had a large family: besides Gabriele, two of the sons attained some eminence, Andrea becoming a canon in the church, and Domenico being well reputed in letters and antiquities. Gabriele gave early signs of more than common ability, and was placed by the local grandee, the Marchese del Vasto, to study in the university of Naples. He had a fine tenor voice, and was sometimes urged to try his success on the operatic stage; he drew with such precision that some of his extant pen-drawings with sepia-ink might readily be taken for steel-engravings; he composed poetry, both written and improvised, and became one of the most noted improvisatori in Naples. The boyhood and youth of Rossetti passed in a period of great political commotion, consequent upon the revolutionary and imperial wars of France. The Bourbon king of Naples, Ferdinand I., was ousted by the Parthenopean Republic, and again by King Joseph, the brother of Napoleon, and his successor King Joachim (Murat), the emperor's brother-in-law, and Ferdinand had to retire to Sicily. Rossetti obtained an appointment as Curator of Ancient Bronzes in the Museum of Naples, and also as librettist to the operatic theatre of San Carlo: he wrote the libretto of an opera, *Giulio Sabino*, was well received at the court of the Napoleonic sovereigns, and in 1813 acted as a member of the provisional government sent to Rome by Murat. After the restoration of Ferdinand to Naples in 1815 he continued his connection with liberal politicians, and joined the widely-diffused secret society of the Carbonari. In 1820 a military uprising compelled King Ferdinand to grant a constitution on the model of that which had recently been established in Spain. Rossetti saluted its advent in one of his most celebrated odes, beginning 'Sei pur bella cogli astri sul crine' ('Beautiful indeed art thou, with the stars in thine hair'). The good faith of the king was highly dubious from the first, and in 1821 he abrogated the constitution, and put it down with the aid of Austrian troops. The constitutionalists were proscribed and persecuted, Rossetti among them. Two verses in one of his lyrics are said to have given

especial offence to the king—'Chè i Sandi ed i Luvelli Non sono morti ancor' ('For Sands and Louvels are not yet dead'—alluding to the assassination of Kotzebue and of the Duc de Berri). Rossetti had to escape from Naples with the kindly connivance of the British admiral, Sir Graham Moore, who shipped him off to Malta in the disguise of a British naval officer. In Malta he was treated with great liberality and distinction by the governor, Mr Hookham Frere; and towards 1824 he came over to London, with good recommendations, to follow the career of a teacher of Italian. In 1826 he married Frances Mary Lavinia Polidori, daughter of a Tuscan father and English mother; soon afterwards he was elected professor of Italian in King's College, London. They had four children: (1) Maria Francesca, born 1827, died 1876 (author of *A Shadow of Dante*, &c.); (2) Gabriel Charles Dante (see below); (3) William Michael, born 1829 (critical writer, and editor of Shelley); (4) Christina Georgina (see below). In London Rossetti lived a studious, laborious, and honourable life, greatly respected by his pupils, and by Italian residents and visitors; he was a man of strong and steady affections and vivacious temperament, earnest and single-minded in all his pursuits. In politics he was a vigorous liberal, but more inclined to a constitutional monarchy than a republic; in religion he was mainly a freethinker, but tending in his later years towards an undogmatic form of Christianity. Though totally opposed to the papal system and pretensions, he would not openly abjure, in a Protestant country, the Roman Catholic creed of his fathers. His health began to fail owards 1842, and his sight became dim, one eye being wholly lost. After some attacks of a paralytic character he died in Albany Street, London, on 26th April 1854. Besides some poems published in Italy, Rossetti produced the following works: *Dante, Commedia* (the *Inferno* only was published), with a commentary aiming to show that the poem is chiefly political and anti-papal in its inner meaning (1826); *Lo Spirito Antipapale che produsse la Riforma* ('The Anti-papal spirit which produced the Reformation'—an English translation also was published), reinforcing and greatly extending the same general views (1832); *Iddio e l'Uomo, Salterio* ('God and Man, a Psaltery'), poems (1833); *Il Mistero dell' Amor Platonico del Medio Evo* ('The Mysterious Platonic Love of the Middle Ages'), 5 vols., a book of daring and subtle speculation tending to develop the analogy between many illustrious writers as forming a secret society of anti-Catholic thought, and the doctrines of Gnosticism and freemasonry (1840); this book was printed and prepared for publication, but withheld as likely to be deemed rash and subversive; *La Beatrice di Dante*, contending that Dante's Beatrice was a symbolic personage, not a real woman (1842); *Il Veggente in Solitudine* ('The Seer in Solitude'), a speculative and partly autobiographical poem (1846); it circulated largely, though clandestinely, in Italy, and a medal of Rossetti was struck there in commemoration; *Versi* (miscellaneous poems), 1847; *L'Arpa Evangelica* ('The Evangelic Harp'), religious poems (1852). The views of Rossetti regarding Dante, along with Petrarca and many other Italian authors, excited a great deal of controversy, which still continues in various forms and with varying fortunes. His memory is much revered in his native place, where the house of his birth has been bought as public property, and a theatre and the chief square have been named after him.

Dante Gabriel Rossetti (or properly Gabriel Charles Dante), elder son of the foregoing, was born in Charlotte Street, Portland Place, London, on 12th May 1828. He was educated in King's College School, London; but, having from his earliest years evinced a wish to become a painter, he was taken from school in 1843 and commenced the study of art, entering soon afterwards the antique school of the Royal Academy. Here he associated with the young painters John Everett Millais and William Holman Hunt, and the sculptor Thomas Woolner; along with these three he founded the so-called Pre-Raphaelite Brotherhood, which was completed by the addition of three other members. The chief incentive to the foundation of this society, and of the school of art which it initiated, was the distaste and disrespect felt by the youthful artists for the poverty-stricken conceptions and slurred execution which marked most of the art then current in England, mingled with a sincere and reverent delight in those qualities of genuine and spontaneous invention, lofty feeling, and patient handiwork, which had been developed by the European schools of art preceding the culmination of Raphael and his followers. A natural result of this frame of mind was a disposition to realise objective details to the utmost, with a view to the thorough authenticity of the visible means through which ideas are conveyed; but it was a mistake of some observers, who noticed a scrupulous exactness and sometimes a plethora of details, to suppose that the main concern of the associated artists was really with the details, and not with the ideas. The English Pre-Raphaelites wished to exhibit true and high ideas through the medium of true and rightly elaborated details. Two other mistakes have been frequently repeated concerning these artists; first, that they were an offshoot of the 'Tractarian' movement, guided by religious pietism; and second, that they were set going by Mr Ruskin. Rossetti's earliest oil-picture, exhibited in 1849, was 'The Girlhood of Mary Virgin;' his next (1850), now in the National Gallery, 'The Annunciation.' After this he withdrew from exhibiting almost entirely, and his art developed through other phases, in which the sense of human beauty, intensity of abstract expression, and richness of colour were leading elements. He produced numerous water-colours of a legendary or romantic cast, several of them being from the poems of Dante, others from the Arthurian tradition. Among his principal oil-pictures are the Triptych for Llandaff Cathedral, of the 'Infant Christ adored by a Shepherd and a King,' 'The Beloved' (the Bride of the Canticles), 'Dante's Dream' (now in the Walker Gallery, Liverpool), 'Beata Beatrix' (National Gallery), 'Pandora,' 'Proserpine,' 'The Blessed Damozel' (from one of his own poems), 'The Roman Widow,' 'La Ghirlandata,' 'Venus Astarte,' 'The Day-dream.' He designed several large compositions, such as the 'Magdalene at the door of Simon the Pharisee,' 'Giotto Painting Dante's Portrait,' 'Cassandra,' and the 'Boat of Love' (from a sonnet by Dante); but these he failed to carry out as pictures on an adequate scale, partly owing to his receiving constant commissions to execute smaller works, consisting mostly of female half-figures ideal in invention or feeling, and executed in life-size. The early studies of Rossetti in art had not been so steady or systematic as might have been wished. Afterwards, beginning in 1848, he had the advantage of some friendly training from his constant intimate, Mr Ford Madox Brown, the historical painter; but, notwithstanding his passionate impulse as an inventive artist, and his impressive realisation of beauty in countenance and colour, some shortcomings in severe draughtsmanship and in technical method, and some degree of mannerism in form and treatment, have often, and not unjustly, been laid to his charge. Rossetti began writing poetry about the same time that he took definitely to the

study of painting. Besides some juvenile work, and some translations from the German (that of *Henry the Leper*, by the mediæval poet, Hartmann von der Aue, is preserved), he executed a number of translations from Dante and other Italians, published in 1861 as *The Early Italian Poets*, and again in 1874 as *Dante and his Circle*. Two of his best-known original poems, *The Portrait* and *The Blessed Damozel*, were written in his nineteenth year, and many others followed. These were about to be published in 1862 in a volume (some of them having been previously printed in magazines —chiefly in *The Germ*, 1850, and *The Oxford and Cambridge Magazine*, 1856), but a domestic calamity intervened, and all idea of publication was set aside for some years. Rossetti had fallen in love towards 1851 with a very beautiful girl, a dressmaker's assistant, named Elizabeth Eleanor Siddal; he married her in 1860, but she died suddenly in February 1862. In the first impulse of desperation he buried his MSS. in her coffin. In 1869 he thought fit to recover them, and in 1870 he issued his volume named *Poems*, containing the bulk of those compositions and several others written not long before the date of publication. This volume was a success with poetical readers, and was reviewed with great admiration and even enthusiasm by some leading critics. Late in 1871, however, Mr Robert Buchanan, writing in the *Contemporary Review* under the pseudonym of Thomas Maitland, attacked the book on literary, and more especially on moral grounds, and soon afterwards he republished his article, *The Fleshly School of Poetry*, as a pamphlet. Rossetti was now in a depressed state of health, suffering much from insomnia, from an abuse of chloral as a palliative, and from weakened eyesight (he often thought he would become blind, as his father had very nearly been). The literary detraction, conspiring with physical malady, produced a strong and exaggerated effect upon him; and from about the middle of 1872 he became morbidly sensitive and gloomy, and very recluse in his habits of life, though his naturally strong sense, and his turn of mind, in which a good deal of humour and practicality was blended with idealism, continued to form a substantial counterbalance. In 1881 he published a second volume of poems named *Ballads and Sonnets* (containing some of his finest work, 'Rose Mary,' 'The White Ship,' 'The King's Tragedy,' and the completed sonnet-sequence, 'The House of Life'), and at the same time he re-issued, with some omissions and interpolations, the *Poems* of 1870. His health was by this time extremely shattered. A touch of paralysis affected him towards the end of 1881, and, retiring in the hope of some improvement to Birchington-on-Sea, near Margate, he died there of uræmia on 9th April 1882. The poetry of Rossetti is intense in feeling, exalted in tone, highly individual in personal gift, picturesque and sometimes pictorial in treatment, and elaborately wrought in literary form. These characteristics are sometimes made consistent with simplicity, but more generally with subtlety, of emotion or of thought. As in his paintings, there is a strong mediæval tendency. It is now generally allowed that Mr Buchanan's charges of immorality against the writings were wide of the mark; indeed, he himself has admitted and proclaimed as much. Rossetti was intimate at one or other period of his life with many of the best men of the day. In politics he took no part. His religious views were vague—at times negative enough; but he had a strong sense of reverence, and a tendency to superstition rather than distinct faith. In person he was of middling height, with a handsome, expressive physiognomy, more Italian than English. His portrait, a pencil-drawing executed by himself towards the age of eighteen, is in the National Portrait Gallery. He was generous, unthrifty, warm-tempered, clear-headed but not discursive in habit of mind, very natural and unaffected in manner, concentrated in aims and modes of work. In almost all companies in which he mixed he assumed and preserved a marked ascendency, due to his exceptional faculty and uncompromising tone of mind and character.

Christina Georgina Rossetti, younger daughter of Gabriele and Frances Rossetti, was born in Charlotte Street, Portland Place, London, on 5th December 1830. She was brought up entirely at home under her mother's tuition, as a member of the Anglican Church. She began writing verse in early girlhood. Before she was seventeen a little volume of her poetry was privately printed by her maternal grandfather, Gaetano Polidori, who kept a printing-press for his own convenience at his residence in London. Her publications are *Goblin-Market and other Poems* (1862), *The Prince's Progress and other Poems* (1866), *Singsong* (1872), *A Pageant and other Poems* (1881); and, in prose, *Commonplace and other Stories* (1870), *Speaking Likenesses* (1874), *Verses* (1893), and a few devotional volumes, among them *Time Flies, a Reading Diary* (with verses, 1885), and *The Face of the Deep* (on the Apocalypse, 1892). Most of her poems were re-issued in 1890; and after her death, her brother William undertook a complete edition of her works. Miss Rossetti, whose health was weak, died 29th December 1894. She had lived a very secluded life, divided between devoted attention to her mother (who died at a very advanced age in 1886), and earnest religious thought and practice. In direct poetic gift and intrinsic quality of poetry she may be regarded as fully equal to her brother Dante Gabriel, although the outcome is of a less conspicuous kind. Her poems have a singular degree of grace, delicacy, and spontaneity, deep in feeling, sensitive and certain in touch, and marked by great purity of emotional thought, and by an unfailing instinct of style. Several of her lyrics have been set to music, and cantatas for two of the longer poems—*Goblin-Market* and *Songs in a Cornfield*—were composed by Aguilar and Macfarren. See her Life by Mackenzie Bell (1898).

As to Gabriele Rossetti, various critical articles regarding him, more especially discussing or confuting his views concerning Dante, &c., will be found in contemporary periodicals, and in some volumes; the work of Aroux, entitled *Dante Hérétique, Révolutionnaire, et Socialiste* (1854), is founded chiefly on Rossetti's researches, which it presents in an exaggerated form. As to Dante Gabriel Rossetti, see William Sharp, *Dante Gabriel Rossetti, a Record and Study* (1882); Hall Caine, *Recollections* (1882); Joseph Knight, *Life of Dante Gabriel Rossetti* (1887; 'Great Writers' series); William Rossetti, *Dante Gabriel Rossetti as Designer and Writer* (1889); the article by Theodore Watts in the *Encyclopædia Britannica*: the monograph in the *Portfolio* by F. G. Stephens (1894); and the Memoir and Family Letters (2 vols. 1895) by his brother William Michael (born 1829), author of the above article, who has also published the following books: *Dante's Comedy, the Hell*, blank verse translation (1865); *Fine Art, chiefly Contemporary* (1867); *Lives of Famous Poets* (1878); *Life of John Keats* (1887); *Shelley's Adonais, with Notes, &c.* (Clarendon Press, 1891); annotated editions of Shelley and of Dante Gabriel Rossetti (2 vols. 1886), and other writings.

Rossi. Pellegrino, was born of a noble family at Carrara, 13th July 1787. He studied at Bologna, and was made professor of Law there at twenty-five. Exiled after the fall of Murat, he obtained a chair at Geneva, and there wrote his *Traité de Droit Pénal*. In 1833 Louis-Philippe called him to Paris, and appointed him professor of Political

Economy at the Collége de France. For his *Cours de Droit Constitutionnel* (1836) he was naturalised and made a member of the Chamber of Peers. He was sent to Rome as ambassador in 1845, and there witnessed all the events of 1848, having again become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX. Rossi strove to oppose the party favourable to the House of Savoy, and devised an alliance with Naples, his object being a confederation of Italian princes with the pope as president. This roused the hatred of the Romans, and Rossi was stabbed to death by an unknown hand on the 15th November 1848.

Rossini, Gioacchino Antonio, Italian operatic composer, was born at Pesaro, on the Adriatic, February 29, 1792, and was the only child of Giuseppe Rossini, town trumpeter and inspector of slaughter-houses, from whom he inherited his brightness and humour. From the age of seven he studied music and singing at Bologna under various masters, till in 1807, after having appeared as conductor of the local Accademia dei Concordi, he entered the Bologna *Liceo*, or conservatorium. He soon became known in neighbouring towns as accompanist at the theatres, travelling along with his father, now a horn-player. Numerous operatic works, mostly successful, were written for the theatres at Venice, Bologna, Rome, &c.; at Milan, in 1812, *La Pietra di Paragone* made a great impression, and gained the composer exemption from the French conscription. Next year *Tancredi*, at Venice, created the wildest excitement, which soon spread over Italy. After producing several other works, now mostly forgotten, he was engaged as musical director of the San Carlo and Del Fondo theatres at Naples. On February 5, 1816, was brought out at the Argentino theatre in Rome *Il Barbiere di Seviglia*, founded on Beaumarchais' play, and written in thirteen days. From the predilection of the Romans for the aged Paesiello, who had written an opera on the same play, and from a series of ludicrous accidents, it resulted on the first night in a complete fiasco; but next night, after the first act had been fairly heard, the public in their enthusiasm proceeded to Rossini's house, and conducted him to the theatre in triumph; and its popularity increased with each succeeding representation. Of all his works it has the prospect of most lasting vitality, and in its complete accord with the libretto is the most perfect as a whole. *Otello* next came out in Naples, and marked an advance in the style of serious opera, but was not at first successful; the tragedy was too sombre. The comic *Cenerentola*, in 1817, was favourably received in Rome, and immediately thereafter *La Gazza Ladra* obtained a triumph at Milan. These were rapidly followed at Naples by *Armida* and *Mosè in Egitto* (1818), *La Donna del Lago* (1819), and *Maometto Secondo* (1820). In 1821 he married Isabella Colbran, who had sung frequently in his operas, and the two proceeded to Vienna, where his music and his attractive personality carried all before him, in spite of some bitter opposition. After his return to Bologna, *Semiramide* was written in 1823 for the Fenice Theatre, Venice; but though the greatest, or at least the most advanced, of his Italian works, it had only a lukewarm reception—it was too heavy for the Venetians. Invited to London, he and his wife on their way thither paid their first visit to Paris, where he had so cordial a reception that he resolved to return. In England he was welcomed with the greatest favour by the king and the aristocracy, but produced no new work, though much was said of an opera intended for the King's Theatre.

On his return to Paris he entered on the duties of director of the Théâtre Italien for eighteen months; and, though not exactly the man for such a post, he had the credit of engaging several famous singers, and produced some of his already written operas, as well as Meyerbeer's *Crociato*. Retained in the service of the king, he went on to adapt several of his works to French taste: *Maometto*, appearing in its new shape as *Le Siège de Corinth*; *Moïse*; and *Le Comte d'Ory*, new, but worked up from old material. After an interval of a year, spent in retirement and study, there appeared at the Académie, on August 3, 1829, his greatest work, *Guillaume Tell*, conceived and written in a style entirely different from and superior to that of his Italian operas, and more nearly conforming to modern dramatic ideas. Its success was immediate and immense, but, chiefly owing to the wretched libretto, not lasting. From this period till his death his pen was scarcely more than once again resumed; except a few trifles, its only product was the *Stabat Mater*, first given in 1841, highly attractive and always popular, but little in keeping with the majestic sadness of the subject. After the decision, in his favour, of a tedious lawsuit, he retired in 1836 to Bologna, to comfort the last years of his father, and to bestow the utmost care on the *Liceo*, which he raised to a high position as a school of music. His wife died in 1845, and in 1847, after he had married again, revolutionary disturbances drove him from Bologna to Florence. In 1855 he returned to Paris, and in his villa at Passy became one of the most noted and attractive personalities of the capital. He died there, November 13, 1868. He stands at the head of Italian composers for the stage, though Verdi has now far wider popularity and greater dramatic force and passion, and though only a few of his operas still hold the field—above all, the *Barber*, *Semiramide*, and *William Tell*. His early works would now sound strangely old-fashioned, but he led the way in reform and progress up to modern ideas. While all his improvements had been elsewhere anticipated by Mozart, and some of his devices were very transparent and soon became hackneyed, the taste of the audiences for whom he wrote must not be forgotten in estimating his music. The greatest of his varied gifts was an inexhaustible facility in creating melodies which at once delight the ear—an unacquirable possession, and the first requisite of a great composer; and though he did not use all the means available in his art, the splendid results he obtained are perhaps on that account even the more remarkable.

See the biography by H. S. Edwards (1869), the same author's shorter Life in the 'Great Musicians' series (1881), and the more extensive French work of M. Azevedo (1865). There are also works on Rossini by Montrond, Zanolini (1875), and Sittard (1882).

Ross-shire. See Ross and Cromarty.

Roster (corrupted from Register) is a list of individuals, or corps, kept by the various staff officers of the army to ensure the allotment of duties in proper rotation. Thus officers are detailed in turn for guard, court-martial, or other duties, according to the district, garrison, or regimental roster. Regiments, battalions, and batteries take their turn of foreign service according to the adjutant-general's roster.

Rostock, the most important town of Mecklenburg-Schwerin, and one of the busiest ports on the Baltic, stands on the Warnow, 7 miles from its mouth and 60 miles by rail NE. of Schwerin. It consists of the city proper, surrounded by promenades on the site of the old fortifications, and suburbs which have grown up beyond them. It has busy fairs for wool, horses, and cattle; imports coal, wine, herrings, petroleum, groceries, timber,

&c.; exports grain, wool, flax, and cattle; owns a mercantile fleet of 750 vessels of some 150,000 tons; and is entered annually by more than 900 vessels of about 120,000 tons. Vessels above 200 tons unload in part at Warnemünde, at the mouth of the river. The industries are very varied, the most important being shipbuilding, the making of machinery, tanning, brewing, distilling, the manufacture of hats, tobacco, &c. The university, founded in 1418, but rebuilt in 1867, is the chief of the public institutions; it has 40 teachers, 360 students, a library of 140,000 volumes, an observatory, and an experimental agricultural colony. Amongst the churches are St Mary's (1398–1472), one of the finest Gothic churches of north Germany, in which is a monument of Grotius, and St Peter's, with a tower 414 feet high. The ducal palace (1702) and the 14th-century Gothic town-house also deserve mention. There is a handsome public park. The statue of Blücher, a native of the town, adorns one of the squares. Pop. (1875) 34,172; (1890) 44,388. Rostock, an ancient Slav town, was burned to the ground by Waldemar of Denmark in 1161. In 1314 it came to Mecklenburg. About this time it enjoyed great repute as a powerful member of the Hanseatic League, and secured important rights of self-government. It still possesses a thoroughly republican municipal constitution, and forms a separate estate in the Mecklenburg Assembly. See history by Koppmann (Rostock, 1887).

Rostoff. (1) a town of south Russia, stands at the head of the delta of the Don and on the railway (1875) from Moscow to the Caucasus. It owes its origin to the foundation of a fortress here in 1761, since which time the progress of the town, owing to its advantageous situation, has been remarkable. Pop. (1881) 44,500; (1885) 61,256. It exports corn, linen, and wool to the value of £3,000,000 a year; its imports only reach £30.000. The manufactures are growing rapidly, the principal articles produced being ropes, tobacco, macaroni, soap, and leather; but there are also shipbuilding-yards, wool-cleansing establishments, and caviare-factories. Two important fairs are held here every year.—(2) One of the oldest towns of Russia, stands on a small lake, 129 miles by rail NNE. of Moscow, and has celebrated market-gardens, a large fair, an extensive trade, tallow-works, and coarse linen manufactures. Pop. 11,898.

Rostopchine, Feodor Vassilievich, Count, a Russian general, was born in the government of Orel, March 23, 1763, and entered the Russian military service as a lieutenant in the Imperial Guard. He won great influence over the weak mind of the Emperor Paul, who promoted him to various offices in rapid succession. In May 1812 the Emperor Alexander appointed him governor of Moscow. He it was, according to the French writers, who planned and began with his own hand the burning of Moscow. But in 1823 he published *La Vérité sur l'Incendie de Moscou* (Paris, 1823), in which he rebuts the charge, affirming that this action was due in part to a few of the inhabitants, and in part to the violence and negligence of the French. Nevertheless, he subsequently recalled this denial and admitted his share in the burning, in that he at least set fire to his own mansion-house. He died at Moscow, January 30, 1826. His works, which include a number of historical memoirs, two comedies, &c., in Russian and French, were published at St Petersburg in 1853. See life by Schnitzler (Paris, 1863) and by Ségur (Paris, 1872).

Roswitha, or Hrotswitha. See Drama, Vol. IV. p. 83.

Rot. See Fluke, Dry Rot.

Rotation. When all points of a body are moving with the same Velocity (q.v.) the motion is one of pure translation, and is easy to comprehend. When, however, this condition is not fulfilled there must exist the kind of motion known as rotation. As simple examples, take the whirling of a flywheel or the motion of the hands of a watch. In such cases we readily see that there is, in the rotating body, a row of points which does not itself move. This row of points is called the axis of rotation, and every other point in the body describes a circle about it. To specify the motion completely we must know not only the position of this axis, but also the rate of rotation and the sense, clockwise or counterclockwise, with which the body is rotating about the axis. The rate of rotation may be measured by the number of revolutions made in a chosen time. It is more scientific, however, to measure it in terms of the angular speed. If the body is rotating uniformly the angular speed is the angle described in unit time by any plane drawn in the body parallel to or containing the axis of rotation: e.g. with the unit of time one sidereal day, the earth's angular speed about its axis is 2π or 360°; but with the second as the unit of time the angular speed is a quarter of a minute of arc, or ·000073 in radians.

In a simple geometric way a given rotation may be represented by a directed line taken of length numerically equal to the angular speed, and drawn along the axis of rotation in that direction which is related to the sense of rotation exactly as the to-and-fro motion of a right-handed screw is to the rotational motion of the screw. Such a directed quantity of definite length and of definite line position is called by Clifford a *rotor*. It is a Vector (q.v.) under the restriction that its lie in space is limited to a particular straight line.

So long as the axis of rotation is fixed with reference to lines which appear steady to us, there is no difficulty in apprehending the character of the motion. Take, however, the case of a carriage wheel or boy's hoop rolling along the road. Here we may regard the wheel as rotating about an axis drawn through the centre, while the axis is at the same time travelling forward with a definite linear speed—i.e. we may regard the motion as a combination of translation and rotation. In this particular case we may, however, represent the motion at each instant as one of pure rotation about an axis coinciding with the instantaneous line of contact of the wheel with the road. For, with rolling and no slipping, this line of contact with the road is for the moment at rest. And it is almost self-evident that, if at any instant there exists in rigid connection with a moving body an axis momentarily at rest, the instantaneous motion must be of the character of a rotation about this axis. The above is a simple example of what holds generally in uniplanar motion—i.e. motion in which every point of the body moves in a plane perpendicular to a fixed direction. The general theorem is that any uniplanar displacement whatever (which is not a pure translation) can be effected by a pure rotation about a determinate axis. Since any given motion may be regarded as consisting of a succession of displacements, it follows that any such uniplanar motion can be effected by a succession of rotations about instantaneous axes whose successive positions in space and in the body are determinate.

In uniplanar motions generally it is clear that the instantaneous axis of rotation, however much it may move both in space and in the body, must always remain parallel to the same direction. If discontinuous motion be excluded—and all natural motions are continuous—this instantaneous axis

will pass continuously from position to position. It will trace out cylindrical surfaces, one in space and one in the body; and at any given instant these surfaces will touch along the line which is for the moment the instantaneous axis. It is not difficult to show that the complete motion of the body may be represented by the rolling of one of these surfaces upon the other. In the simple case of the carriage wheel the rolling surfaces are evidently the circumference of the wheel and the plane of the road. These theorems in uniplanar motion have many interesting applications in the kinematics of machinery (see Minchin's *Uniplanar Kinematics*, Clarendon Press, 1882).

If the motion is not uniplanar it is no longer possible in general to represent it by a succession of pure rotations. There is, however, a very remarkable theorem, which can be proved without difficulty, but which is hard of apprehension and even of acceptation. It is that after any displacement whatever of a body in space there is, in the body or rigidly connected with it, a line of points which is simply shifted along its own line in space. The whole displacement may then be effected by means of a sliding along this line together with a pure rotation about it—in other words, by a definite screw motion with reference to this line as axis (see SCREW). Even in the simpler case, when by fixing one point of a body we quite exclude translation, it is not easy to grasp the significance of the fact that after any displacement there is always one row of points which occupy exactly the same positions as before the displacement. From this theorem it follows that, however such a body may be moving, there is momentarily a line which is at rest. This line is the instantaneous axis of rotation. It always passes through the fixed point, and will as it shifts in time describe two conical surfaces, one in space and the other in the body. Any given continuous motion can then be effected by the rolling of one determinate conical surface fixed in the body upon another fixed in space. As a familiar example take an ordinary spinning-top. Here to the eye there is in general a rotation of the top about its axis of figure, while at the same time the top executes a conical motion about a vertical line through the point of support. In reality, however, at any instant of time the top is subject to *one* rotation about an instantaneous axis, which coincides neither with the axis of figure nor with the vertical line. This instantaneous axis executes a definite conical motion, both in the body and in space. Clerk-Maxwell (see his collected papers) devised a very ingenious and simple optical method for observing the position of the instantaneous axis, and so studying experimentally its motions with reference to the top. It should be mentioned in conclusion that infinitely small rotations are resolved and compounded according to the same laws as velocities and forces, so that we may regard the instantaneous angular velocity of a rotating body as made up of component angular velocities about any three chosen axes. It is thus that the subject is usually treated analytically. Such a treatment, however, is essentially artificial; and for a natural treatment we must go to geometry or to the Calculus of Quaternions (q.v.).

Rotation of Crops. In successful tillage-farming it is a fundamental principle that the various crops shall be grown in a well-considered rotation. There are solid reasons for this. The plants, like the animals, of the farm differ much in their habits and in the different sorts of food upon which they subsist. Although all plants tend to exhaust the soil, they do so in widely different degrees; they withdraw from the soil different kinds and quantities of ingredients. Some of the farm crops have long, penetrating roots, which draw nourishment from the deeper layers of the soil; others have short or spreading roots, which ramify near the surface. Certain crops occupy the ground for a much longer period than others; some encourage the growth of weeds or interfere with the proper cleaning of the land; others facilitate the work of eradicating weeds; and finally, the 'crop residues' of the various plants of the farm differ greatly. A glance at the following figures, giving the average weight of the principal ingredients removed (per acre in lbs.) from the soil by the leading farm crops, will show the importance of growing these crops upon a carefully-considered system of rotation.

	Nitrogen.	Potash.	Lime.	Phosphoric Acid.	Silica.
Wheat (30 bushels)	48	28·8	9·2	21·1	96·9
Barley (40 bushels)	48	35·7	9·2	20·7	68·6
Oats (45 bushels)	55	46·1	11·6	19·4	85·3
Swedes (21 tons)	153	118·5	63·6	32·5	10·0
Turnips (17 tons)	112	148·8	74·0	33·1	7·7
Mangolds (22 tons)	147	300·7	42·9	52·9	17·9
Potatoes (6 tons)	47	76·5	3·4	21·5	2·6
Beans (30 bushels)	99	67·1	29·2	29·1	7·3
Clover hay (2 tons)	102	83·4	90·1	24·9	7·0
Meadow hay (1½ tons)	49	50·9	32·1	12·3	56·9

It is thus obvious that by alternating the root, the cereal, and the grass and clover crops the producing power of the soil is more easily maintained, and its exhaustion longer deferred. With the fuller knowledge which is now available both as to the wants of the plants and the means of supplying these wants, it is possible, and in certain cases also practicable, for the farmer to grow with success the same kind of crop on the same land year after year for almost any length of time. A more economical method, however, is to alternate the crops, so that the natural resources of the soil and the repairing influences incident to a judicious rotation may be utilised to full advantage. It was long ago demonstrated in practice that when land lies for a few years under grass and clover it becomes enriched with ash constituents and nitrogen. The grasses and clovers not only increase the quantity of nitrogen in the surface soil by drawing supplies of it from the subsoil and from the atmosphere, but they have also the power of conserving that accumulated nitrogen in a form in which it is easily made available to a crop of grain. Points often insufficiently considered in tillage-farming are the period of growth and the season of the year during which the crop occupies the ground. Judging from the table given above, one would imagine that turnips would require in the form of manure far more nitrogen than is required for wheat. In practice, however, it is well known that exactly the reverse is the case. The difference in the points just mentioned, that is in the period and season of the growth of the two crops, is responsible for this important peculiarity. Nitrification (q.v.), or the formation of nitrates in the soil, is most active during summer and autumn, and the cereal crops thus occupy the ground at the time when the soil is comparatively deficient in nitrates. The root-crop on the other hand is in full growth in the autumn, when the supply of nitrates in the soil is at the maximum. Root-crops consumed on the farm are therefore a good preparation for succeeding crops of cereals. The precise form of rotation most suitable for particular farms varies greatly, depending upon various circumstances, and especially the nature of the soil, climate, markets, available supplies of extra manures, amount of live-stock kept, &c. That course of cropping is evidently the most desirable which will economically secure, with thorough cleanness of the soil, a high and increasing state of fertility.

Many rotations are based upon the Norfolk or four-course system, which consists of (1) clover or

mixed grass seeds; (2) wheat or, in many parts of Scotland, oats; (3) turnips, swedes, mangolds, potatoes, or bare fallow; (4) barley. The details of this system are generally as follows. The clovers or grasses are mown or grazed; when cut they are either used green or are dried for hay; the second crop is carted home for the cattle or horses; near towns it is sold off; or it is consumed on the ground in racks by sheep, which on most highly cultivated farms receive besides a daily allowance of cake or corn. In districts where the town-manure can be obtained a top dressing is applied as soon as the first crop of grass is cut. On the poor and worse cultivated soils the grass-crop occasionally remains down for two, or even three years, thus extending a four into a five or six years' rotation. The clovers or mixed seeds are ploughed up in autumn, and followed generally in England by wheat, and in Scotland by oats. These crops are now often drilled, to admit of horse and hand hoeing. After harvest the stubble is, if possible, cleaned by the scarifier, grubber, or plough and harrows; or, where the management for several years has been good, any patches of couch-grass or other weeds are best forked out by hand. The land, especially if heavy, or intended for mangolds drilled on the flat, as practised in the drier parts of England, may then be manured and deeply ploughed: the grubber and harrows, in April or May, suffice to prepare for the drilling of mangolds or swedes. Heavy land, intended either for roots or barley, should, in spring, be disturbed as little as possible. In Scotland, and the cooler moist climates of the north and west of England, turnips and potatoes are grown on raised drills or balks, in which the manure lies immediately underneath the plant. Frequent horse and hand hoeings should ensure the thorough cleaning of the crop. Unless in the neighbourhood of towns, where it is greatly more profitable to sell off the whole of the root-crop, part of the swede or mangold crop is taken home for the cattle, and the remainder consumed by sheep in the field. After the fallow or cleaning crop another cereal crop is grown; under the Norfolk system this is generally barley, with which the clovers or seeds are sown out. Where sewage or tank water is available Italian rye-grass is often used, and on land in high condition early large and repeated cuttings are obtained; but rye-grass has the disadvantage of being a worse preparation than clover for the wheat-crop which usually follows. The chief failing of the four-course system consists in the frequent recurrence of clover, which cannot be successfully grown oftener than once in six or eight years. To obviate this difficulty one-half of the clover quarter is now often put under beans, peas, or vetches, thus keeping the grass or clover seeds eight years apart.

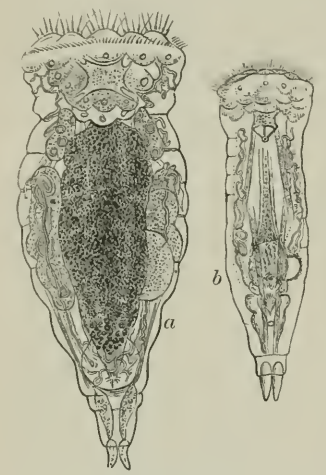
The Norfolk four-course system is unsuitable for heavy land, where a large breadth of roots cannot be profitably grown, and where their place, as a cleaning crop, is taken by bare fallow, vetches, or pulse. Bare fallows are, however, much less frequent than formerly, being now confined to the most refractory of clays, or to subjects that are so hopelessly full of weeds as to require for their extirpation several weeks of summer weather, and the repeated use of the steam or horse ploughs, the scarifier, grubber, and harrows. In such circumstances winter vetches are often put in during September or October, are eaten off by sheep and horses in June or July, and the land afterwards cleaned: this practice is extensively pursued on the heavier lands in the midland and southern counties of England. In such localities the following system is approved of: (1) The clover leas are seeded with (2) wheat; then come (3) beans, pulse, or vetches, manured, horse or hand hoed; (4) on good land wheat succeeds; (5) oats or barley often follow, but, to prevent undue exhaustion of plant-food, this system requires considerable outlay in artificial manures, cake, and corn; (6) a fallow, or fallow crop, deeply and thoroughly cultivated, and well manured, comes to restore cleanness and fertility; (7) barley or wheat is drilled, and amongst this the clover-seeds are sown. On the heavier carse-lands in Scotland the following plan of cropping is practised: (1) Clover; (2) oats; (3) beans: (4) wheat; (5) root-crop, usually including a considerable breadth of potatoes; (6) wheat; (7) barley, with which the clovers or mixed grasses are sown. Under this system it is difficult, with so few cleaning crops, to keep the land clean; roots, besides, are not produced in quantities sufficient properly to supply either cattle or sheep during the winter. To remedy these defects roots may be introduced after the oats, and would be followed either by wheat or barley. This extends the rotation from seven to nine years.

In most well-cultivated districts, whether of heavy or light land, stock-farming is extending, and a more vigorous effort is being made to raise the fertility of the land. Root-crops are accordingly more largely grown; indeed, it is sometimes found profitable to grow two root-crops consecutively; thus, after turnips, swedes, cabbages, or mangolds, well manured from the town or farmyard, and eaten off by sheep, potatoes of superior quality are produced with one ploughing and a dose of portable manure. Specialities of management occur in almost every locality. Near London, and in other southern districts, early potatoes or peas are grown for market, and are immediately followed by turnips. In many parts of England, where the soil and climate are good, rye or vetches sown in autumn are consumed in early summer, and a root-crop then put in.

Good rotations do not necessarily ensure good farming; they are merely means to an end. And as agricultural education and enterprise extend fixed rotations will be less regarded. The market-gardener, who extracts a great deal more from his land than the farmer has hitherto been able to do, does not adhere to any definite system of cropping. If the farm is kept clean and in improving condition there can be no harm in growing whatever crops it is adapted to produce. Cropping clauses are requisite during only the three or four last years of a tenancy. The restrictions found in some agreements, preventing the growth of clover for seed, flax, and even potatoes, are inadmissible. Equally objectionable are clauses against the sale of particular sorts of produce, such as hay or roots. The farmer, if he is fit to be entrusted with the use of the land, ought to be permitted to grow or sell off any crop he pleases, provided an equivalent in manure be brought back. On well-cultivated land, in good condition, it is now the practice of the best farmers to take oats or barley after wheat; indeed, some of the best malting barley in Essex, on the Scottish carse-lands, and elsewhere is now grown after wheat. The frequent growth of cereals, and the heaviest of hay and root crops, even when removed from the farm, may be fairly compensated for by judicious and liberal treatment with town-dung, sewage, or artificial manures. The plant-food disposed of in the more ordinary sales of the farm is economically restored by the use of bones or superphosphate, guano, or nitrate of soda, or by keeping plenty of stock on the farm, and supplying them liberally with cake and corn. See also the articles AGRICULTURE, FALLOW, MANURE, SOILS, and those on the various crops.

Rotatoria, or ROTIFERA, a class of minute aquatic animals, popularly called wheel-animalcules. Most of them are microscopic, very trans-

parent, and exceedingly active. The body is unsegmented, and almost always bears a posterior ventral 'foot,' and an anterior equipment of cilia, whose movements suggest a rapidly rotating wheel. Another characteristic structure is the masticating mill in the pharynx, a complex apparatus consisting in part of two hammers, which work against an anvil. The food seems to consist of yet smaller organisms and of organic debris. The nervous system consists of a single dorsal ganglion. There is a body-cavity containing fluid, and there are muscles retracting and extending the ciliated disc and the foot. There are no circulatory organs, but two excretory tubes are present. Rotifers live both in fresh waters and in the sea, and sometimes in damp moss. A few are parasitic. Some are able to survive desiccation, and may be wafted about by the wind, but it is likely that in some cases the regeneration after prolonged drought is due not to a revivification of the adults, but to the development of the eggs, which can remain for a long time quiescent. There are three kinds of eggs: small ova, which develop into males; thin-shelled summer ova; and thick-shelled resting or winter ova. And it is said that a given female produces only one kind. Sometimes they are laid in the water, or attached to water-plants; sometimes they are hatched within the mother. In most, if not all cases, the eggs are parthenogenetic, developing without fertilisation. For in one series of rotifers (Philodinadæ) the males have never been found; while in other cases the males, which are usually smaller and simpler than the females, do not succeed in fertilising the eggs. As representative rotifers the following may be mentioned: *Rotifer vulgaris*, very common in stagnant fresh-water pools; *Hydatina scuta*, with exceedingly rapid development; Melicerta, which forms an ensheathing case of disgorged pellets; the parasitic Seison, Albertia, Balatro, which have lost, or almost lost, the characteristic ciliated wheel; Floscularia, living in a gelatinous case; the exceedingly beautiful Stephanoceros; *Pedalion mira*, a unique jumping rotifer, with six hollow leg-like appendages. The zoological position of rotifers is uncertain, but some regard them as remotely allied to Chætopod worms.



Hydatina seuta:
a, female dorsal view; *b*, male ditto.

Rotche, or Little Auk. See Auk.

Rothamsted, or Rothamstead Park, 4 miles NW. of St Albans, is noted as the scene of the agricultural experiments of Sir J. Bennet Lawes. See Agriculture, Vol. I. p. 103.

Rothe, Richard, one of the greatest speculative theologians of Germany, was born at Posen, 28th January 1799. At the universities of Heidelberg and Berlin he had among his teachers Daub, Hegel, Schleiermacher, and Neander. After a two years' course in the clerical seminary at Wittenberg and a short period of lecturing as *privat-docent* at Breslau he set out for Rome in December 1823 as chaplain to Bunsen's embassy. In 1828 he accepted a professorship in the Wittenberg seminary, whence in 1839 he migrated to fill a similar position at Heidelberg. In 1849 he obeyed a call to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of Theology and member of the Oberkirchenrath, and here he died, August 20, 1867. Rothe was one of the noblest types of the theologian that Germany has produced, in his rare combination of simple inward piety with fearless boldness of thought. The patient care he lavished on a wife afflicted with a mental malady, the great personal influence he exerted over his students, his humility, charity, and that magnificent prophetic optimism that already saw the whole universe aglow with the glory of the Redeemer, all testify alike to the beauty and elevation of his character. His conception of the kingdom of God founded by Jesus reminds an English reader of the grand scheme of Hooker in its identification of the religious and moral functions of church and state, in a kind of refined and glorified Erastianism. Indeed the special function of the church will come to an end as soon as the state has become permeated with the religious idea, its purpose being merely that of a temporary instrument in the realisation of this ultimate ideal. The real end of Christianity is to create no hierarchical theocracy, but a spiritualised community with all its social and political functions harmonised with the divine morality. Profane and sacred sciences will at length coalesce, all education will become religious, and the instinct of worship will find nourishment in a regenerated theatre and an elevated art. The work of the church meantime is essentially educative and preparatory—itself a means and not an end—and all its efforts to realise itself as a distinct society are an unfaithfulness to its real principle. The Catholicism of the middle ages was a grand attempt to realise a visible church, but frustrated its highest end because it denaturalised the true social relations when it gave itself a purpose and a policy antagonistic to the state. The Reformation conception of the *invisible* church was an attempt to avoid the difficulty of the Catholic theory, but it created a purely spiritual community, separated from the ordinary interests of social and national life, and with a fatal tendency to the error of a divorce between religion and morality, the former emphasising the interests of the individual for eternity, the latter relating merely to his social duties here—in themselves considered as of no religious value.

Rothe's theory deals a deathblow to clericalism and all exaggeration of the importance of the external organisation. It may be that it will be for ages yet to come nothing beyond a devout imagination, but at least it is a splendid attempt to realise the Christian dream of the kingdom of God, to carry into effect Christ's distinction between mere outward form and inward spirit, and the eternal fact that it is in life as God Himself has made it that the power and spirit of the gospel ought to manifest itself. This speculative theory is worked out in the first of the three books of Rothe's unfinished work, *Die Anfänge der Christlichen Kirche* (1837)—the second and third books are historical. His greatest work is his *Theologische Ethik* (3 vols. 1845-48; 2d ed. completed by Holtzmann from his papers, 5 vols. 1869–71), which supplements the preceding book, being based on the same fundamental identity between religion and morality, the starting-point being the idea of God involved in consciousness, and con-

sidered in relation to the world and to man. Here in his pursuit of analogies into the world of science Rothe too often leaves behind him the solid earth of reality, and ventures on hypotheses that are little better than visionary, and, moreover, his style is not seldom abrupt, obscure, and perplexing. His *Dogmatik*, posthumously edited by Schenkel (3 vols. 1870–71), completes his ethics. Here he distinguishes sharply between Revelation itself and the Bible—its documentary record. The former is not so much a supernatural communication of a religious doctrine as a particular form of God's redemptive activity, strengthening and rectifying the religious consciousness of man disturbed by sin. The true object of Revelation is the knowledge of God; its mode of operation is not magical, but is accompanied by an internal action on the consciousness producing a special receptivity by means of which the external manifestations in history and nature may be understood. It is supernatural in its cause, but natural in its method, although admitting alike of inspiration, of miracle, and of prophecy—not contradictions of nature, but rather inherently constituent elements of a Revelation, subserving higher laws of nature unknown to man's limited faculties, but perfectly homogeneous with a divine order.

During his last ten years, after the formation of the Protestantenverein, Rothe took an active part in ecclesiastical affairs, as a leader in the School of Conciliation. He was an admirable preacher, but with characteristic modesty could hardly be induced to publish his sermons. Schenkel edited three volumes in 1869, but took unwarrantable liberties with the text, in the way of modifying the supernaturalism. A fourth and reliable volume was edited by W. Hübbe in 1872.

The Prolegomena which Rothe had contributed to *Studien und Kritiken* he collected under the title *Zur Dogmatik* (1863). After his death, besides the books already named, there were edited from his papers *Vorlesungen über Kirchengeschichte*, by Weingarten (2 vols. 1875–76); *Abendandachten über die Pastoralbriefe*, by Palmié (2 vols. 1876–77); *Der erste Brief Johannis*, by Mühlhäusser (1878); *Theologische Encyklopädie*, by Ruppelius (1880); *Geschichte der Predigt*, by Trümpelmann (1881); *Gesammelte Vorträge u. Abhandlungen*, by Nippold (1886). Nippold also edited the *Stille Stunden* (1872; Eng. trans. 1886) and wrote his Life (2 vols. 1873–74).

Rothenburg, a town of Bavaria, on the Tauber, 36 miles W. by S. of Nuremberg, preserves its mediæval character in great part unaltered. Pop. 6221. The town produces a periodic procession and historic play in memory of its escape from being sacked in the Thirty Years' War, during which the town (then a place of 18,000 inhabitants) was repeatedly taken and retaken.

Rotherham, a busy manufacturing town in the West Riding of Yorkshire, on the right bank of the Don, here joined by the Rother, 5 miles ENE. of Sheffield by a railway opened in 1838. Its chief glory is the magnificent cruciform church, Perpendicular in style, with crocketted spire and fine west front. It is probably somewhat earlier than its reputed founder, Thomas de Rotherham, Archbishop of York (1423–1500); in 1875 it was restored by Sir G. G. Scott at a cost of £9000. A handsome edifice in the Collegiate Gothic style, built for an Independent College in 1875 at a cost of £26,000, has been bought for £8000, and applied to the purpose of a grammar-school (1483), at which Bishop Sanderson was educated. There are also a mechanics' institute (1853); a free library (1881); an infirmary (1870); a covered market (1879); public baths (1887); a park (1876) of 20 acres, 300 feet above the town; and the Clifton Park of 57 acres, which, costing £25,000, contains a fine mansion-house, and was opened by the Prince of Wales on 25th June 1891. The manufactures include stoves, grates, chemicals, pottery, glass, railway-carriages, &c. Ebenezer Elliott was a native of the suburb of Masborough, which is included within the municipal boundary, incorporated in 1871. Roche Abbey, a ruin, 8 miles ESE., was a Cistercian foundation (1147); and 8 miles NE. is Conisborough Castle, noticed at Doncaster. Pop. (1851) 6325; (1871) 25,892; (1881) 34,782; (1891) 42,050. See John Guest's huge *Historical Notices of Rotherham* (1879).

Rothesay, a favourite Scotch watering-place, the capital of Buteshire, is beautifully situated on the north-east shore of the island of Bute (q.v.), 40 miles by water W. of Glasgow and 19 SSW. of Greenock. 'Sweet Rothesay Bay,' rimmed by hills 400 to 530 feet high, offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Its charming scenery, its bathing facilities, its sheltered position, and the extreme mildness of its climate have rendered Rothesay a resort alike of holiday-makers and of invalids, especially those affected with pulmonary disease. Its linen and cotton manufactures, tanning, and boat-building are almost or quite extinct; and the herring-fishery is now the principal industry. A score of the Clyde steamers touch regularly at Rothesay, whose commodious harbour was constructed (1822–84) at a cost of over £30,000. An esplanade was formed in 1870; and among the chief edifices are the county buildings (1832–67), public hall (1879), aquarium (1876), academy (1869), and Glenburn hydropathic (1843; burned down in 1891, and rebuilt). In the middle of the town are the ruins of Rothesay Castle, founded about 1098, taken by Haco of Norway (1263), the death-place of Robert III. (1406), reduced to ruin (1685), and repaired in 1871–77 by the Marquis of Bute, at a cost of £8000. Rothesay since 1398 has given the title of duke to the eldest son of the Scottish sovereign. Created a royal burgh in 1400, it returned a member from the Union till 1832. Pop. (1821) 4107; (1881) 8329; (1891) 9108. See books by J. Wilson (1848) and Thoms (1870).

Rothschilds, the well-known family of bankers, take their name from the sign of the house ('Zum Rothen Schilde,' or 'red shield'), in the Jews' quarter of Frankfort, in which their ancestors lived. The real founder of the family as financial magnates was Meyer Amschel Rothschild, who was born at Frankfort in 1743. Although educated for a rabbi, he embarked in the banking business at Hanover, and, having saved a little money, started for himself as a money-lender and dealer in old coins in the family home at Frankfort. He won the confidence of the landgrave of Hesse, who entrusted his finances to the Jew's management. The current story, that he successfully hid the fortune of the landgrave from the French invaders in 1806, and was through his patron's gratitude allowed to have the almost free use of it for some years, and so by this means laid the foundation of a large fortune, is extremely doubtful. The beginnings of his fortune were in all probability less romantic: the Rothschild house got a heavy commission for transmitting money from the English government to Wellington in Spain during the eight years of the Peninsular war; they managed the large private fortune of the landgrave; through them the British government made its payments of subsidies to continental princes; they negotiated large loans for Denmark between 1804 and 1812. At his death, on 13th September 1812, Meyer Amschel Rothschild left five sons, all of whom were made barons of the Austrian empire in 1822. Anselm Meyer, the eldest son, born in 1773, died 1855, succeeded as head of the firm at Frankfort.

Solomon (1774–1855) established a branch at Vienna; Nathan Meyer (1777–1836), a branch in 1798 at London; Charles (1788–1855), a branch at Naples (discontinued about 1861); and James (1792–1868), a branch at Paris. Apart from their very extensive private banking business these houses have been deeply concerned in negotiating many of the large government loans of the 19th century. The cleverest man of the five was Nathan, who really lifted the house into its position as first amongst the banking-houses of the world. He pinned his faith and staked his fortunes on the success of Britain in her great duel with Napoleon, and is said to have been present himself at the battle of Waterloo, from which he hastened home to London, where, before the result of the battle became known, he had sold and bought stock that brought him one million sterling clear profit. He was succeeded by his son Lionel (1808–79), who distinguished himself by his efforts to effect the civil and political emancipation of the Jews in Great Britain. The present head of the London branch is Lionel's son, Sir Nathan (born 1840), who succeeded to the baronetcy conferred in 1847 on his uncle Anthony. He was raised to the peerage as Baron Rothschild in 1885. His niece Hannah (1851–90) was in 1878 married to the Earl of Rosebery. See Reeves, *The Rothschilds* (1887), and *Das Haus Rothschild* (Prague, 1857).

Rotifera. See Rotatoria.

Rotomahana. See New Zealand, p. 487.

Rotrou, Jean de, a French tragic poet, second only to his friend and contemporary Corneille, was born at Dreux, August 21, 1609, went early to Paris, and became a busy playwright, as well as one of the five poets—the others were Corneille, Colletet, Bois-Robert, and L'Etoile—who worked up into dramatic form the ideas of Richelieu. His first piece, *L'Hypocondriaque*, was followed by *La Bague de l'Oubli*, imitated from Lope de Vega, and that by *Cleagénor et Doristée*, *Diane*, *Les Occasions Perdues*, *L'Heureuse Constance*, all in the Spanish romantic style. Next followed a busy period of classical influence, culminating in his last years with three masterpieces, *Le Véritable Saint Genest*, a tragedy of Christian martyrdom under Diocletian; *Don Bertrand*, a capital comedy; and *Venceslas*, which kept the stage almost down to our own day. Tradition tells that Rotrou led a dissipated life in Paris, and further was inordinately addicted to gambling; more honourable is the authentic history of his death. He held an official post at Dreux, and when he heard that the plague had broken out there, and that the mayor had fled like Montaigne in the same circumstances from Bordeaux, he hastened to the town to preserve order, caught the pestilence, and died a few hours after, June 28, 1650.

As many as thirty-five of his plays are still extant, but many more are lost. A complete edition was edited by Viollet-le-Duc (5 vols. 1820–22); six of the plays, by M. de Ronchaud (2 vols. 1882). See Jarry's *Essai* (1868), the works by Person on *Saint-Genest* (1882) and *Venceslas* (1882), and G. Steffens, *Rotrou-Studien* (i. 1891).

Rottenburg, an episcopal town in Würtemberg, 6 miles SW. of Tübingen, on the Neckar, has an old castle, now a prison, and a cathedral, and trade in hops and timber. Pop. 7310.

Rottenstone, a soft and earthy stone, consisting chiefly of alumina, with about 10 per cent. of carbonaceous matter and a little silica. It is supposed to be formed by decomposition of shale or siliceous limestone. It is found in Derbyshire, England, in Wales, and near Albany, in the state of New York. It is brown—either grayish, reddish, or blackish. It is soft and easily scraped to powder, and is well known to housewives, being much used for cleaning and polishing brass and other metals.

Rotterdam, the busiest port of Holland, stands on both sides of the Maas, 19 miles from its mouth, and 16 miles by rail SE. of the Hague and 45 SW. of Amsterdam. Since Holland was separated from Belgium, the trade of Rotterdam has grown at an extraordinarily rapid rate, especially since the middle of the century. New wharves and quays and new docks have been built almost every year since 1847. In 1888 the quays measured 15 miles in length and the docks covered an area of 190 acres; and since then two new docks have been made and the (separate) petroleum wharves have been extended. Since 1872 sea-going vessels have ceased to approach Rotterdam by the old channel of Brill (Brielle); they have used instead the New Waterway—i.e. the Maas and the Scheur, the latter of which has been connected with the sea by a canal cut through the Point (Hoek) of Holland. Every effort has been made to render this new waterway available for large ocean-going steamers, and the work of improvement has been constantly going on ever since it was opened, until in 1890 it had a depth never less than 22 feet at low tide, and big ships were able to reach the sea in two hours from Rotterdam. Taking all the vessels that enter all the ports of Holland from abroad, more than 53 per cent. (estimating by tonnage) enter at Rotterdam. The net tonnage of the vessels (which numbered 4535 in 1890) so entering doubled between 1875 and 1890, and was in the latter quoted year eight times what it was in 1850—viz. 2,918,425 tons in 1890 as against 1,411,828 in 1875, and 346,186 in 1850. To this foreign trade must be added 84 per cent. of the total trade between Germany and Holland by way of the river Rhine, or (in 1890) some 2,582,800 tons, and a traffic of 6,850,000 tons carried on on the inland canals and streams. If all these items be put together the total tonnage of vessels entering Rotterdam amounts to nearly 12½ million tons, a figure that is only exceeded by London amongst European ports. But, on the other hand, it must be remembered that the bulk of the inland traffic would in other countries be counted amongst the statistics of goods brought by railway. The figures quoted do not include the returns of the fishing fleet, which sells in Rotterdam fish (chiefly herring, cod, &c.) to the value of £20,000 per annum. The merchant fleet of Rotterdam itself numbered, in 1899, 150 vessels of about 360,000 tons. The imports consist principally of mineral ores and

metals, grain (wheat, rye, oats, maize), coal, oil (petroleum chiefly), seeds, tallow and similar greasy substances, sugar, rice, tobacco, hides, indigo, &c.; whilst the more important exports are linen, flax, butter, cheese, cattle, and spirits (gin, &c.). From this port there sail every year between 5200 (1885) and 15,200 (1889) emigrants from various parts of Europe, most of whom go to the United States. There are flourishing industries, as iron and other metal works, shipbuilding, distilling, sugar-refining, and the manufacture of tobacco, chemicals, &c.

The town is intersected by canals, which communicate with the Maas, whilst their banks serve as wharves. On the south side of the river, opposite the city proper, are the busy ironworks and shipbuilding-yards of the island of Fijenoord, besides some of the largest docks. This island is connected with the other bank by two lofty bridges (one a railway bridge). In the city the more important buildings are the Gothic church of St Lawrence (15th century), with a very large organ, the monumental tombs of the Dutch admirals Witt, Cortenaer, Van Brakel, Van Liefde, and others, and a lofty tower (295 feet high); the Boymans Museum (1847), with a fine collection of paintings by Dutch masters; the yacht club-house, containing an ethnological collection; the town-house, exchange, and similar public buildings. The public institutions include an academy of art and science (nearly 1100 pupils), schools of music, navigation, and the technical arts, and an excellent zoological garden. Pop. (1890) 203,472, with which compare the figures for earlier years—72,300 in 1830, and 104,724 in 1858. Rotterdam counts as her most illustrious sons Erasmus and the poet Tollens; James, Duke of Monmouth, and Grinling Gibbons, the English wood-carver, were also born here. The history of the place is marked by very few notable events, except its capture by Francis of Brederode in 1488, who lost it to the Austrians in the following year, and the occupation by the Spaniards in 1572.

Rotti, an island in the Indian Archipelago, belonging to the Dutch, lies to the south-west of Timor. It is 36 miles in length (655 sq. m.), and has a pop. of 60,000. The surface, though hilly, is nowhere more than 800 feet above the sea, and the fertile soil produces a rich vegetation.

Rottlera, a genus of trees of the natural order Euphorbiaceæ, found in India and other parts of tropical Asia. The most important species is *Rottlera tinctoria* (Roxburgh), subsequently called by Müller *Mallotus philippinensis*. It is a small tree, the wood of which is only fit for fuel, but its bark is employed for tanning, and the crimson powder which covers the ripe fruit is used for dyeing silk, and also as a purgative and anthelmintic. The *R. tetracocca* and *R. peltata* of Roxburgh have also been included in the genus Mallotus by Müller under the names *M. albus* and *M. roxburghianus*.

Rottweil, a town of Würtemberg, on the Neckar, 68 miles by rail S. by W. of Stuttgart, has manufactures of gunpowder and silk and cotton fabrics, and railway workshops. Near by, on the site of an ancient Roman colony, a number of antiquities, including a valuable piece of mosaic work, have been discovered. Pop 6052.

Rotumah, an island in the south Pacific, annexed to the Fiji Islands by Great Britain in 1881, is distant about 300 miles NNW. from the nearest island of that group, of which it is a dependency. Area, 14 sq. m.; pop. 2300, all Christians.

Roturier (according to Littré from *ruptura*, Low Latin for ground *broken* by the plough), under feudalism, when the feudal theory of knight's-service was recognised as the only principle of gentle tenure, one who continued to hold by the older or allodial tenure, and was accordingly regarded as ignoble. See FEUDALISM, ALLODIUM.

Roubaix, a town in the north of France (dept. Nord), 6 miles by rail NE. of Lille. It rose into importance during the 19th century. Here cloth for men's clothing, shawls, stuffs for furniture and ladies' dresses, velvet and similar textiles, chiefly of wool, cotton, and silk, are manufactured to the annual value of £16,000,000. Besides these things, thread, sugar, beer, spirits, machinery, &c. are produced, and there is a very active trade in these manufactured goods. Pop. (1810) 9000; (1876) 74,946; (1891) 105,191.

Roubillac, LOUIS-FRANCOIS, sculptor, was born at Lyons in 1695, studied mainly at Paris, where in 1730 he obtained the second Grand Prix, and shortly thereafter settled in London. In England he spelt his name *Roubiliac*. He visited Rome in 1745. His statue of Handel for Vauxhall Gardens in 1738 first made him popular. His other most famous statues are those of Shakespeare (executed for Garrick, and now in the British Museum), of Sir Isaac Newton at Cambridge, and another of Handel in Westminster Abbey. The monuments of the Duke of Argyll and of General Wade in the Abbey are also well known. He contributed greatly to the improvement of British taste in sculpture, though his own work is by no means so perfect as his contemporaries imagined; he has been called 'an exquisite executant but poor designer.' He died in London, 11th January 1762. See the Life by Le Roy de Sainte Croix (Paris, 1882); A. Dobson in *Eighteenth Century Vignettes* (1894).

Rouble, the unit of the Russian money system, first cut from silver bars in 1321, and coined in 1655. There are now gold imperials and half-imperials of 10 and 5 roubles. But most of the currency is paper, and the ratio of the gold rouble to the paper rouble was in 1896 fixed at 1½ to 1. In 1897 imperials and half-imperials were coined of 15 and 7½ roubles (i.e. paper roubles). The silver rouble is nominally worth 3s. 2d. But when silver is at 26d. per oz., it is really worth 1s. 4½d.; at 30d. per oz. 1s. 6⅜d. In 1888 silver was 42⅞d.; in 1890, 47⅜d.; in 1894, 29d.; in 1898, 26¾d. The rouble is divided into 100 kopeks.

Rouen (Lat. *Rotomagus*), formerly the capital of Normandy, and now the chief town of the department of Seine-Inférieure, and after Lyons perhaps the principal manufacturing city of France, is situated on the right bank of the Seine, 87 miles NW. of Paris by railway. The ramparts have been converted into spacious boulevards, little inferior to those of Paris. The modern streets are well and regularly built, with good stone houses; but a considerable part of old Rouen still remains, consisting of ill-built picturesque streets and squares, with tall, narrow, quaintly carved, wood-framed and gabled houses. The Seine, upwards of 300 yards broad, makes Rouen, although 80 miles from the sea, the fourth shipping port of France; and extensive operations, in the way of deepening the river and building quays, are yearly adding to its capacity and importance, no less than £710,000 having been expended on the port between 1831 and 1887. A stone bridge and a suspension bridge lead to the Faubourg St Sever on the left bank. Rouen possesses several remarkably beautiful Gothic churches—in particular the cathedral (13th century onwards), St Ouen (14th–15th century; perhaps the best specimen of Gothic in existence), and St Maclou (florid style of the end of the 15th century). The cathedral, the seat of an archbishop, begun by Philippe Auguste, has a very rich west façade, and two fine though unfinished west towers—the south one (Tour de Beurre)

was built (1485–1507) with indulgence money received for permission to eat butter during Lent—but is disfigured by a lofty cast-iron spire (487 feet) erected upon the central tower in 1876 in consequence of an old wooden belfry, which bore the date 1544, having been destroyed by fire in 1822. It contains in its twenty-five highly ornamented chapels numerous monuments of great interest, especially those of Rollo and of his son William Longsword. The heart of Richard Cœur de Lion, once buried there, is now preserved in the extensive Museum of Antiquities. Among other noteworthy buildings in Rouen are the palais de justice (15th century), in which the assizes are still held; the hôtel-de-ville, with its public library of 110,000 volumes, and its gallery of pictures; and the Hôtel Dieu, one of the largest of its kind. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated *Rouenneries*, nankeens, dimity, lace, cotton-velvets, shawls, &c. Rouen has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen yarns, shot, steel, lead, chemicals, paper, confectionery (*Sucre de pomme*), &c. There are also shipbuilding yards and engineering works. Pop. (1872) 102,470; (1891) 112,109.

History.—Rouen is specially interesting to Englishmen as the capital of the Northmen in France, and the first home of the Norman dukes. It was the scene of Rollo's baptism and marriage with Gisela, daughter of Charles the Simple, after that monarch had been constrained to cede Normandy under the treaty of Claire-sur-Epte (912), and there he and his successors lived until Duke William transferred his court to Winchester after the conquest of England (1066). At Rouen William died (1087), and till the time of John it continued the seat of government of the Norman possessions of the English kings. In 1204 it was taken by siege by the French king Philippe Auguste, and annexed along with the main part of the duchy to the French crown. During the wars of Henry V. and Henry VI. of England it was under the power of the English from 1419 to 1449, when it was retaken by the French under Charles VII. It was during this occupation by the English that Joan d'Arc was burned alive (1431) as a witch in the square of the city, in which stands her statue, and which is called in memory of her Place de la Pucelle. Rouen was the birthplace of Corneille (1606), of Fontenelle (1657), of Boieldieu (1775), of Armand Carrel (1800), and of Flaubert. Clarendon died here. It was occupied by German troops in 1870–71. See Fouquet's *Histoire de Rouen* (1875), and other works cited at NORMANDY.

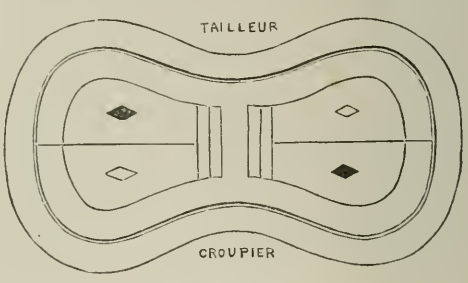
Rouergue, an old province of southern France, between Languedoc, Auvergne, and Guienne, ruled by counts until 1589, when it passed to the crown. See FRANCE, Vol. IV. p. 770.

Rouge, a powder used to give artificial colour to the cheeks. For commoner purposes vermilion rubbed up with almond-oil is employed, but the safer and better quality is prepared from carmine (the colouring matter of cochineal), either alone or mixed with the safflower colour. These are generally rubbed up with French chalk, and supplied either as powder or, along with a little oil, in the form of saucers.

Jeweller's rouge is an impalpable preparation of oxide of iron, obtained by gently heating the yellow oxalate of iron till it decomposes; carbonic acid escaping, and only a red powder being left. It is used for polishing silver, and for this purpose should be of the finest quality. Many cheaper varieties are sold under this name.

Rouge Croix, Dragon. See HERALD.

Rouge et Noir (Fr., 'red and black'), TRENTE-UN ('thirty-one'), or TRENTE ET QUARANTE ('thirty and forty'), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is of a form similar to that shown in the figure. It is divided into four portions, each marked in the centre with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted of a yellow colour (not represented in the figure). The game is played as follows: one of the *tailleurs* (or dealers, who manage the table, take charge of the bank, and keep an eye on the players) takes up his position at one side of the table, opposite to the *croupier* (another tailleur), and unseals, in the presence of the players, six packs of cards, which



Rouge et Noir.

are first counted, then shuffled by several tailleurs, and returned to the first tailleur, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated *noir*, *rouge*, *couleur*, and *l'inverse*, which will be afterwards explained. After the stakes have been laid on the table (those for the noir being laid on either of the quarters marked with a *black*, and those for the rouge on either of the quarters marked with a *red* diamond, those for the 'couleur' on one of the transverse bands, and those for the 'inverse' on one of the yellow circles at the end of the table), the tailleur takes a handful of cards from the top of the pack, and deals first for the noir, taking one card after another from the top of the handful and placing them on the table side by side, till the number of pips on them amounts to more than thirty, when he stops. He then deals out another row in a similar manner for the rouge, till, as before, the number of pips amounts to more than thirty. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards ten each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than thirty and not more than forty. If the value of the first row is nearer thirty-one than that of the second, then the first row, or noir, wins; if the contrary is the case, then the second row, or rouge, wins. Couleur wins if the first card tabled by the tailleur is of the winning colour—for instance, if the first card laid down is a 'spade' or 'club,' and if noir wins; but if the first card dealt be not of the winning colour, then inverse wins, and couleur loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake and winnings, while the stakes of the

losers are raked by the tailleurs to the bank in the centre of the table. When the value of the first, or noir-row, is equal to that of the second, or rouge-row, it is a *refait*, and the dealer must commence to deal anew from the cards remaining in his hand; when the refait occurs the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper. The game of Rouge et Noir would be an even one between the players and the bank were it not for the following regulation: When the points dealt for the noir and the rouge each amount to thirty-one ('un refait de trente-et-un') the half of all the stakes on each of the chances belongs to the bank, and this the players may either pay or have their stakes 'put in prison,' the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of thirty-one occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one-half, which goes to the bank, and the other half is 'put into the second prison,' from which it requires two successive winnings of the player to regain them. The chance of 'un refait de trente-et-un' is about once in sixty-four deals. This game superseded *Faro* (q.v.) and *Biribi* in France about 1789, but along with Roulette was forbidden by law in 1838. See work cited at ROULETTE.

Rouget de Lisle, CLAUDE JOSEPH, author of the *Marseillaise* (q.v.), was born at Lons-le-Saulnier on 10th May 1760. When in 1792 he wrote and composed his celebrated song or hymn he was a captain of engineers stationed at Strasburg. Four months later, as too moderate a republican, he was imprisoned in Paris, but was released after Robespierre's fall. Wounded at Quiberon (1795), he quitted the army, and lived in Paris in narrow circumstances, until Louis-Philippe in 1830 awarded him a small pension. He died at Choisy on 26th June 1836. He published in 1796 a volume of *Essais en Vers et en Prose;* but none of the pieces it contains, nor indeed any of his other books, possess much real merit. The *Marseillaise* was his one inspiration. See a Memoir by Poisle-Desgranges (Paris, 1864), and one by Tiersot (1892).

Rouher, EUGÈNE, a French statesman, was born at Riom, on November 30, 1814, practised there as an advocate up to 1848, and then was returned to the Constituent Assembly. Towards the end of 1849 he was appointed minister of Justice; and with slight interruptions he was for twenty years a member of the French government. He was chiefly instrumental in negotiating the treaty of commerce between France and England in 1860, and that between France and Italy in 1863, and was thus instrumental in preparing the way for the introduction of the free-trade policy of Napoleon III. In 1863 he was appointed minister of State, and maintained that position until 1870, when he became president of the Senate. A staunch supporter of Napoleon III., and a clever debater, Rouher was, next after the emperor, the chief supporter of the system, domestic and foreign, which came to a disastrous end at Sedan—he was sometimes called the Vice-emperor. After the fall of the empire he fled abroad. But he was returned to the National Assembly for Corsica in 1872, and sat till 1875 as a staunch defender of the ex-emperor. He died at Paris, 3d February 1884.

Roulers (Flem. *Rousselaere*), a town of West Flanders, Belgium, 19 miles by rail SSW. of Bruges, has manufactures of cottons, lace, and chicory, and a trade in linen. Here the French defeated the Austrians on 13th July 1794. Pop. (1887) 19,735; (1896) 21,603.

Roulette (Fr., 'a little wheel'), a game of chance which from the end of the 18th century till the beginning of 1838 reigned supreme over all others in Paris. It continued to be played at German watering-places till 1872, when it ceased in terms of an act passed four years before. Roulette then found a home at Monaco. It is played on a table of an oblong form, covered with green cloth, which has in its centre a cavity of a little more than 2 feet in diameter, in the shape of a punch-bowl. This cavity, which has several copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the centre of the cavity, the handle by which motion is communicated being a species of cross or capstan of copper fixed on the upper extremity of the axis. Round the circumference of this movable bottom are 38 holes, painted in black and red alternately, with the first 36 numbers, and a single and double zero; and these 38 symbols are also figured at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words—*pair, passe, noir, impair, manque, rouge*, which will be afterwards explained. Those who manage the table and keep the bank are called *tailleurs*. The game is played as follows: One of the tailleurs puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity an ivory ball in a direction opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake his money on 1, 2, or any of the 38 numbers (including the zeros), and shows what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the tailleurs 36 times his stake—viz. his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, &c. The blank rectangles at the bottom of each of the 3 columns of numbers figured on the table are for the reception of the stake of that player who selects a column (12 numbers) as his chance, and if the ball enters a hole the number of which is found in his column, he is paid 3 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win receive double their stake (their stake and as much more), and under the following circumstances: The 'pair' wins when the ball falls into a hole marked by an *even* number; the 'impair,' if the hole is marked *odd;* the 'manque,' if the hole is numbered from 1 to 18 *inclusive;* the 'passe,' if it is numbered from 19 to 36 *inclusive;* the 'rouge,' if it is coloured *red;* and the 'noir,' if it is coloured *black*. If the ball should fall into either of the holes marked with the single or the double zero, the stakes of those players who venture upon the 6 chances last described are either equally divided between the bank and the players, or as is more commonly the case, they are 'put in prison,' as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that at this trial the ball again falls into one of the two holes marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are 'put into the second prison,' and so on. The tailleurs thus have an advantage over the players in the proportion of 19 to 18. The player who bets upon the numbers labours under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances,

still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he does win, whereas he only receives 35 times that amount, a manifest advantage in favour of the bank in the proportion of 37 to 35. See Professor J. S. Bond, *The Problems of Roulette and Trente et Quarante* (New York, 1889).

Roumania, a kingdom in the south-east of Europe, situated between 22° 29′ and 29° 42′ E. long. and between 43° 37′ and 48° 13′ N. lat. Its general boundaries are on the east and south the rivers Pruth and Danube (with the exception of the Dobrudja, a province south of the latter river at its embouchures), and on the west and north the Carpathian Mountains, along whose heights the boundary line runs. The kingdom presents the form of an irregular blunted crescent, some writers comparing it to a sausage. Its average length is about 358 and its breadth about 188 miles; its approximate area is 49,250 sq. m., and its population (1895) was 5,417,260, including 200,000 Gypsies. Of these 4½ millions belong to the Greek Church (the national religion), and the remainder are Protestants, Jews, &c. There are believed to be about 4,000,000 of Roumanians outside the Roumanian kingdom—in Hungary and Transylvania, Bukowina, Bessarabia and adjoining Russian provinces, Servia and Bulgaria.

The general configuration of the surface of Roumania is an irregular inclined plane, sloping down from the Carpathian Mountains to the northern bank of the Danube, and it is traversed by numerous watercourses (many of which are dry in summer), taking their rise in the mountains and falling into the great river, which render the country well adapted for every kind of agricultural industry. Roumania is divided, roughly speaking, into the two provinces of Wallachia and Moldavia, the first bordering on the Danube, the second on the Pruth. These were formerly distinct principalities, were then united as Moldo-Wallachia, and finally incorporated as an independent kingdom under Charles I. The capital of Roumania is Bucharest in Wallachia, about 30 miles from the Danube; and the chief town of Moldavia is Jassy, not far from the river Pruth. The other towns of any note in Roumania are the seaports of Galatz and Ibrail (or Braila) at the mouth of the Danube, Craiova (Krajova), Botoshani, Ploiesti (Plojeschti), Pitesti, and the ancient capital Curtea d'Ardges. The last named is famous for its beautiful cathedral, built of a grayish-white limestone resembling alabaster, in the Byzantine order of architecture, with a profusion of Moorish or Arabesque ornamentation.

The most noteworthy peaks of the Carpathians rise from 3000 to 9000 feet above the sea-level, the highest two being Caraïman and Verful, from which a distant view of the Balkans, in Bulgaria, is obtainable in clear weather. Near the foot of Caraïman, at the junction of three valleys, and surrounded by lovely wooded slopes, nestles the charming summer-resort of the court and upper classes, Sinaïa. Here the king and queen occupied an old monastery until a beautiful palace was built in the Italian style, where the court spends a considerable portion of the summer. Besides the palace there are many handsome private residences, as well as a public garden, casino (not a gaming-table), and two or three good hotels.

The principal industries of Roumania are agriculture, salt-mining, and petroleum raising and distillation. The principal salt-mines are at Prahova, near Campina, in the Wallachian Carpathians, and at Ocna in Moldavia. They are worked by convicts, and produce a fine bluish-gray rock-salt. Petroleum wells are also worked near Campina, as well as elsewhere, and there are refineries at Tirgovistea, Ploiesti, &c. The chief products of agriculture are maize and cereals, which are largely exported, and amongst the fruits of the country gourds, plums, peaches, walnuts, apples, pears, and grapes are conspicuous and plentiful.

The sylvan scenery of the Carpathians is very lovely, and either there or in the plains are to be found the oak, elm, beech, and, less frequently, the maple, sycamore, mountain-ash, lime, horse-chestnut, and acacia. The usual flora of the subtropical and temperate zones flourish luxuriantly, and at Ferestreu, near Bucharest, there is an excellent agricultural and sylvicultural college. The manufacturing industries of the country are still in their infancy, and are greatly handicapped by the cheap productions of Germany and Austria. They include flour and saw milling, match-making, and petroleum-distillation, to which have been added (through an act passed in 1887 for encouraging Roumanian industries) tanning, boot and shoe making, and cement manufacture. Notwithstanding the large importation of manufactured articles of various kinds from Austria, Germany, France, and Great Britain, the peasantry are mainly clothed in garments made by themselves of home spun, woven, and dyed fabrics, and they possess such taste and skill in the manufacture and ornamentation of cloth, gauze, and muslin, and in the trimming of costumes, that their work finds a ready market in the best establishments in the capital.

The most remarkable feature in the agricultural system of Roumania is its peasant proprietary, which was created about the year 1864. Before that year the whole of the land of the country was practically held by the boyards or inferior nobles, who were frequently absentees, or by the state, for the peasants merely owned small patches of land contiguous to their huts or hovels, which were and are still frequently semi-subterranean. The peasantry had been robbed of their land during long ages of feudal oppression and foreign conquest, but when the government became democratic it was determined to restore a portion of it (about one-third) to its original owners at very moderate prices to be fixed by the state. In the first instance the government advanced the purchase-money, creating a loan for the purpose. The greater portion of the debt was paid off by the peasant proprietors by the year 1881, and an act was passed to prevent the alienation of embarrassed estates which would otherwise have fallen into the hands of usurers. The result was that in 1880 there existed in Wallachia and Moldavia 406,893 holdings, averaging 10·6 acres each, and the great change has added materially to the prosperity of the country and its thrifty peasantry.

The government of Roumania is a hereditary limited monarchy, and the constitution provides for an irresponsible king, who must belong to the Orthodox Greek Church; a council of ministers; a senate and a chamber of deputies. The members of both houses are indirectly chosen mainly by 'colleges' of voters; but the large towns elect directly. Senators are elected for eight years, one-half retiring every four years. Members of the lower house sit for four years, but either chamber may be dissolved separately. The income of a senator must be at least £376 per annum. One of the most important political institutions in which Roumania is largely concerned is the 'Danubian Commission' (see DANUBE), whose headquarters are at Galatz. There is a British representative on the Commission. This is rendered necessary by the great preponderance of British trade; for whilst the total number of vessels which cleared from the Danube at Sulina in 1897 was 1324, with a tonnage

of 1,397,917, the proportion of British vessels (all steamers but four) was 544, of 855,477 tons, and those figures form approximately the proportion during recent years. The following statistics, concisely stated, show the financial and commercial position of Roumania at the present time, and of her commercial relations with Great Britain.

At the end of the century the National Debt was just over £50,000,000; the revenue about covered an expenditure of £10,000,000. The permanent army comprises 60,000 officers and men. The annual exports of all kinds were valued at about £14,000,000; total value of imports, £10,000,000; total value of exports to the United Kingdom, chiefly cereals and seeds, from £2,500,000 to £4,000,000 a year; total value of exports from the United Kingdom to Roumania, chiefly cotton, yarn, and manufactures, wrought and unwrought metals, coal, &c., from £900,000 to £1,400,000.

History and Political Relations.—The early Greek historians mention a Thracian tribe, the Getæ, from whom were descended the Dacians, a brave race who occupied the northern side of the Ister or Danube, and flourished as a free people down to about the end of the first century of our era. Before that time the Dacians had come into conflict with both Greeks and Romans, but in the year 101 A.D. the Emperor Trajan undertook the first of two expeditions against their king, Decebalus, which terminated in the complete subjugation of the country. Traces of the Roman invasion and conquest are still to be found in the military road constructed by Trajan along the banks of the Danube, including a commemorative tablet, and in the piers of a bridge across the river near Orsova. Pressed by the barbarian races who eventually compassed the downfall of the Roman empire, Dacia, which had been constituted a Roman colony, was evacuated by the Romans in the reign of Aurelian (about 274 A.D.), and for about a thousand years the banks of the Danube served as halting-places for the first-named wandering tribes, amongst whom the most conspicuous were the Goths; the Huns under Attila; the Lombards under Alboin; the Bulgari, who afterwards settled on the plains south of the Danube and founded Bulgaria; the Ungri, a savage race who settled in Hungary; and the Wallachs, from whom Wallachia has derived its name. For a considerable period both banks of the Danube were governed by the sovereigns of what is known as the Wallacho-Bulgarian dynasty, which was brought to a close by a Tartar invasion about the year 1250 A.D. After that there gradually arose out of a number of smaller states an independent realm in Wallachia, with its traditions of heroes and chiefs, Mircea the Old, Michael the Brave (whose memory is perpetuated by a beautiful equestrian statue at Bucharest), and others; whilst the neighbouring state of Moldavia had also its heroes in Stephen the Great, &c. These rulers for a long time resisted the Mussulman advance, but were eventually reduced to vassalage by the victorious Turks, and were compelled to sign what are known as the 'Capitulations,' and to pay an annual tribute to the sultan. The first treaty with Wallachia known by that name was signed as far back as 1393; but that with Moldavia, which country was supported by the king of Poland, followed as late as 1513.

Although Wallachia and Moldavia thus became states tributary to the Porte, they retained sufficient independence to be in a sense autonomous; but in the course of time their princes, or voivodes as they were called, were Turkish nominees, whose tenure of office may be judged by the fact that in the course of ninety years (from 1723 to 1812) the government of Wallachia passed through the hands of no less than forty of those rulers. They were mostly Greeks, known as Phanariotes or Fanariots (q.v.), who during their brief tenure of power practised the most scandalous extortions upon the people, in order to enrich themselves and remit the annual tribute to Constantinople. The great majority of those Fanariot voivodes either were assassinated or were disgraced through the intrigues of their rivals at the Sublime Porte; and some of them did not scruple to appeal during their brief tenure of power for the support of Russia, which country was constantly at war with their suzerain.

The Muscovites began to make inroads into the Danubian principalities as early as the year 1709, under Peter the Great, and continued to invade them at intervals, especially in the reign of the Empress Anne in 1735 and in that of Catharine IV. in 1768. In the first instance the Czar Peter was invited to enter the states by the voivodes Brancovano of Wallachia and Cantemir of Moldavia, who desired to secure their independence under his protection; but no such inducement was afterwards requisite; and although the Russian invasions and occupations were always undertaken on the pretext of liberating the Christians from the Mussulman yoke, the real object has been to advance step by step to Constantinople and to secure possession of the whole Balkan peninsula. At different times the Russians exercised absolute sway in the principalities, notably from 1789 to 1792 and from 1806 to 1812, when the princes under their protection were called Hospodars (q.v.), a Slavonic word. In 1848 they helped to suppress the national rising there, as they did in Hungary, but in 1853, before the Crimean war, their power began to wane. At the termination of that war they were compelled by the allied powers to cede Bessarabia to the principalities.

In the year 1859 both principalities elected Prince Couza (born at Galatz, 1820) as their ruler, and he reigned in Roumania, as the united provinces were then called, until 1866, when he was deposed on account of his extortions and gross immorality, and was succeeded by Prince Charles of Hohenzollern. This revolution was mainly led by two able statesmen, Bratiano and Rosetti, who may be said to have been jointly the counterpart of the Italian Cavour, and who for many years enjoyed great popularity as the chief ministers of state. On the outbreak of the Russo-Turkish war in 1877 the Roumanians espoused the Russian cause. Prince Charles was actually appointed commander-in-chief of the allied armies, the Russian Cesarewitch serving under him; and the Roumanians captured the first redoubt, the Grivitza, at Plevna, thereby enabling the Russians to reduce that stronghold and bring the war to a triumphant close. The conquerors, however, deprived their allies of part of their territory, Bessarabia, giving them in exchange the Dobrudja, which they exacted from the Porte—an exchange laid down in the treaty of San Stefano, and subsequently confirmed by the Berlin Conference (June 1878), when Roumania was recognised as a completely independent power. The effect of that exchange has, however, been unfortunate for Russia in two respects. It has caused a permanent estrangement between the Roumanians and their guardian allies, and the Dobrudja has served as a barrier against Russian aggression in Bulgaria. In 1881 Prince Charles was invested with the kingly dignity with the acquiescence of the European Powers, and since that time, although there have been ministerial crises, and although the Russians have continued to carry on secret intrigues, not only in Roumania, but from thence in Bulgaria, the Roumanians have practically freed themselves from Russian as well as Turkish influence, and have taken their place amongst the independent nationalities of Europe.

The various conquerors who have at one time or another occupied Roumania have left their traces

in her language and customs. The social condition of the middle and upper classes bears traces of the libertinage of their barbarian conquerors of the Mussulman as well as of the Christian faith. The peasantry are a hardy and thrifty race, and in the highest circles of society the influence of Queen Carmen Sylva has been throughout beneficent. As her marriage left no heir, the succession to the throne passed to Prince Ferdinand of Hohenzollern (born in 1865), the nephew of the king.

Language and Literature.—Roumanian (or Wallachian) is one of the Romance Languages (q.v.), a daughter of the Latin; but, though the language is unmistakably Romance in type, the vocabulary is mixed, the number of Latin roots being variously estimated at more or less than half of the total, the next greatest element being Slavonic words (amounting, according to some authorities, to even more than the Latin roots), with some hundreds of Turkish, Greek, and Albanian words. Most Roumanians speak what is practically the same language—the Daco-Roumanian—throughout the kingdom, in Transylvania, in the Banat, and other parts of Hungary, Bukowina, and Bessarabia. The Macedo-Roumanian, south of the Danube and amongst the Balkans and Pindus, is largely modified by Greek; and the Istro-Roumanian, spoken by 2000 or 3000 in Istria and Croatia, has been much Slavonised.

Roumanian literature may be said to date from the 17th century, though the first Roumanian book, a psalter, was printed in 1577. The chronicles of the 17th century are the earliest specimens of national literature; but Greek was long the language of the educated, and it is only since the beginning of the 19th century that there is a popular Roumanian literature, the most interesting part of it being the songs. Of these Alexandri (q.v.), himself the most notable of native Roumanian poets, made a full collection (1866). Other names are Alexandrescu, Eminescu, and Scherbanescu. There are German translations by Carmen Sylva (q.v.), Kotzebue, and others. Dora D'Istria (see GHIKA) wrote mainly in French. Among authorities on the language are Hasdeu, Miklosich, Gaster, and Titkin, and there are histories of the literature by Ciparin, Densusianu, Gaster, Popfiu, and Philippide (1894). The great dictionaries are those of Codresco (1875), Lauriann and Massimu, *Dictionariulu Limbei Romane* (2 vols. 1876–79), and Hasdeu, *Etymologicum Magnum Romaniæ* (parts i. and ii. 1885–92); and there are standard *Chrestomathies* by Gaster (new ed. 1891) and Pompiliu. There are German translations of Roumanian folktales, poems, and songs by Albert Schott (1845), Wite Kremnitz (1882–83), and Rudow (1888).

See works on Roumania in Roumanian by Aurelian, *Terra Nostra* (1880); in French by Beaure and Mathorel (1878), Blaramberg (1886), and Bley (1896); in German by Henke (1877), Bergner (1887), and Benger (1896); and in English by the present writer (1882) and Mrs Walker (1888); the Histories by Laurianu (1873), Hasdeu (1874), Cogulniceanu, Schinkai, Tocilescu, Vacarescu, Hurmuzaki, Stourdza (1886), &c.; Laveleye, *The Balkan Peninsula* (trans. 1887), W. Millar, *The Balkans* in the 'Story of the Nations' series (1896), and other books named at BALKAN PENINSULA; the Roumanian official statistics; and a long series of English consular reports and Board of Trade returns.

Roumanille, JOSEPH (1818–91), born at St Remy (Bouches-du-Rhone), was successively teacher, printer's reader, and bookseller, and obtained the fame of being the greatest of modern Provençal poets, next after Mistral. He was one of the founders of the association of the Félibres (see PROVENÇAL LANGUAGE AND LITERATURE).

Roumelia (Turk. *Rum Ili*, 'land of the Romans'—the inhabitants of the Western Roman empire, or Byzantine Greeks, being known to the Turks as 'Romans'), a name which once applied generally to the whole of ancient Thrace and part of Macedonia. The province aptly enough called Eastern Roumelia is now incorporated with Bulgaria (q.v.). In central Asia *Rum* or *Rumi* means the peoples of western Asia; but the Sultan of Turkey is *Rum-Padishah*. In Turkey itself *Rum* means now usually the Greek nation and the Greek Church.
